[156] The test results indicate that she views interpersonal relations as terrifying struggles in which she may be "demolished" by others. Since her only M in human content is "a couple of men testing their strength" and her Sum/C:Sum/c is 3.5:0, we would say this is how she acts in interpersonal relations at this time. She "tests her strength" — but cautiously. The figures are "in disguise," they are not to be trusted. In meeting people she has to decide whether she is strong enough to be safe, or whether they are so strong that they would harm her.

The FM, on the other hand, are aggressive "climbing up to demolish something," "germ attacking the lung," "bugs attacking throat." This is the enormous aggressiveness of which she is afraid, but it also indicates that she is capable of experiencing this kind of hostility toward others. Under stress or "in states of diminished consciousness" we may see some extremely aggressive behavior on her part.

Since I scored R20 as a pure C response and there are 2CF and no FC, we must conclude that S does become overly emotional at times. They may be "crying spells" or expressions of the anger indicated in the preceding paragraph which she is unable to control. I scored R8 and R12 as Fc' but they may be Fc. If they are Fc' they support the notion that our S has little control over her feelings. The great variability of her initial reaction times also bespeaks of sporadic impulsivity and feelings of anxiety.

*159 158 The more one thinks about it, the more pathological the picture becomes. F plus percent is only 52 despite the 6 populars; there is a positional response on Card IX; there are a few peculiar verbalizations, e.g., the vertebrae and brain being referred to as "the center of man's being" and "the main part of life and

the person's being;" there are overly emotional reactions to blots: "it's terri- 159*
fying if some kind of disease attacks you." And finally all the color comment 158
indicates she is affected by the color but cannot integrate it appropriately.
Thus, she responds emotionally but cannot bring these feelings under control.
A statement of her feelings of impotence or "intellectual passivity" (Piotrowski
1950) is her comment on Card III: "But why the grasshoppers should be playing,
I don't know."

Are there any personality strengths to balance this pathological picture? Just 159*
the six popular responses. These are liberally sprinkled throughout the record.
We would have to conclude then that she is generally able to respond in a socially 157●
acceptable and conventional manner. However, the somatic preoccupations and
poor emotional control are evident throughout. She seems to make an effort to
maintain satisfactory relations with others. She is ready to accept responsi-
bility for difficulties ("You know my trouble is I don't read very much"); al-
though distanciated, her second M response is the pleasant "grasshoppers playing;"
she does respond positively to the "lovely coloring." However, these are all
based on content, rather than determinants, and as such are probably much more
superficial indicators.

This personality description would not be complete without at least some comment 121
concerning the possible influence of the age of the subject and the role expec- 888
tations of this age group among the Klamath. Since this analysis has been done
without the benefit of this latter information, it can only be remarked that, to 157
the extent that elderly people are allowed greater latitude in their behavior,
to that extent this woman's adjustment will be considered acceptable, rather
than pathological. In any case, however, she is probably terrified by disease
and death. One wonders if the change in cultural attitudes toward disease and
death may have left her bereft of a set of beliefs which might have helped her
at this point in her life.

[871]

Fidel quit school because of what he defines as "family trouble," and this failure is probably equally due to his lack of support and training at home, as well as from the mildly hostile, indifferent posture he maintains. He expresses bitter contempt for his family, for the filthy house, for the lack of regular hours, and for the frequent squabbles. His isolation from this group is adequately measured by his lack of knowledge of the interests and affiliations of family members. His contempt for them is balanced by his father's derogatory, competitive attitude towards his son and his mother's indifference. Fidel stands thus, mildly hostile, ambivalent, and infinitely bored, at the brink of independent adulthood. 159* 157

Rorschach Interpretation

159*
157
[156]

Three aspects of this Rorschach protocol stand out: the absence of color responses; the emphasis on movement (of his 14 scorable responses, 12 involved human or animal movement); and the nature of the movement response on Card VIII (R12): "He looks like he's got a grin — I mean a mean look on his face." The content of this movement response suggests that the subject is strongly ambivalent about his role in human relationships. His immediate response to an interpersonal situation is an open, friendly one, but for some reason he shifts to a more aggressive menacing role. It is as if he tries to conceal his immediately positive response to people behind a "mean look."

On the face of it, the absence of color responses seems incompatible with the hypothesis that this man is involved emotionally — either positively or negatively — with other people. However, when we note that the subject is not indifferent to the color aspects of the cards, the interpretation becomes not inconsistent, but richer. In response to Card II, for example, he states, "How come they put different colored ink in them?" The absence of color responses suggests not that the subject is uninterested in personal relationships, but that, since he is unable or unwilling to integrate the color aspects of the blot with the shape of the blot, he probably reacts to the emotional aspects of interpersonal relationships, but does not make the effort required to integrate his feelings with the demands of reality.

How are we to interpret the fact that of 14 responses the subject has 12 movement responses? We must conclude that he has a rich and extensive inner life; he probably gives much thought to the significance and meaning of a situation without giving any overt indication of this thought. The fact that he waits for the examiner to finish writing, for example, indicates that he is aware of what is going on around him.

Five of this subject's six human movement responses are of the guarded restraint variety: "two girls looking at each other," "a man standing there" and so on. His prototypal role, then, involves watchful waiting and a tendency to inhibit the expression of feeling; this inhibition has apparently generalized to a considerable extent (narrow range of content). Perhaps the most revealing response, though, is the frightening "bug with wings" on Card IV. There is a feeling of dark shock here; he tells us after 33 seconds that he doesn't know "what the heck this is." And, on the basis of the inquiry, "It's reaching for you or something" we would have to conclude that the subject is frightened by the aggression implied here.

On four of the cards — involving eight of his fourteen responses — the subject gives an identical response to the blot when seen upside down as when seen right side up: "That's the way it looks — both ways, upside down and the other way." Although this mode of response does occur on occasion, rarely does it assume

*159 the proportions it does in this case. What is the meaning of it? There seem
•157 to be two general kinds of explanations possible. The first involves the notion that the subject's perception is generally vague, so that the specific requirements of the blot are of little importance. He gives the response largely based on internal needs, so it matters little which way he holds the blot.

The second possibility suggests that the subject is indecisive; he can't make up his mind. He isn't able to decide which end is up. These two possibilities are not at all exclusive and there is reason to believe that both are involved (e.g., he can't decide on the sex of the figures in R4; his responses are not well delineated; and on two cards he never does make up his mind).

The most disturbing aspect of the protocol, however, is R13: "something with a fish coming out of its head." This is at least a fabulized combination and as such indicates a looseness of associative processes — a disorder of thinking. The fact that he gives it without comment and that it appears in a relatively brief record makes it more ominous. It suggests strongly that this man is not always able to control his thinking and that he may come to unrealistic conclusions based on very slim evidence.

Since there is not much evidence of strong feelings, however, there seems to be no reason to think that the subject will act in a peculiar fashion. He may have some strange ideas, but they are not likely to influence his behavior very much.
[156] The protocol suggests that this man actually tries to do very little. Because of his fear and distrust of others, he tries to hide from them — possibly behind a somewhat belligerent facade.

Lily: Female, Age 15

Background Data 159*

Lily is an attractive young high school freshman. She is now repeating her 156
freshman year, due to various difficulties the year before. One of these in-
volved her cursing the principal, for which she was temporarily expelled, to [873]
be returned by her mother the next day. She spent the rest of the year in
silent rebellion. This incident is not too serious, for more than anything [561]
else it indicates the strength of her attachment to a close-knit girls peer-
group which is slightly wild and which makes it a matter of honor to oppose
adults. There is little additional evidence of any serious hostility or re-
belliousness. Lily is the eldest of two children; she has an elder half-sister,
her mother's illegitimate daughter; and she has lived all of her life on the
reservation.

Lily's major activities and concerns are those of a typical, small town teen- [883]
age girl. She attends school, "hangs around" a local teen age center, flirts
with the boys — White and Indian, dances — at her home or the home of a friend,
and listens to records. She comes from one of the most stable families on the
reservation. Her mother is Klamath, a grade school graduate who worked her way [874]
through two years of business school, evenings, in a nearby city. Her mother in
recent years has begun to assume a position of leadership in certain community [571]
activities, particularly recreation and education. Additionally, she has for
long been the advisor for numerous relatives. Her mother verbalizes great fear
and anxiety associated with this "getting out" and has done so only under con-
siderable external pressure. Her father is a California Indian who is the model [177]
of local White conceptions of masculinity. That is, he is vigorous and physi-
cally powerful, a hard, reliable, steady worker in a logging company, a hard [464]
"Saturday Night" style drinker, absolutely fearless, and a masterful fighter
in brawls. His fights are the focus of several local folk anecdotes, and suggest [157]•
his excellent reputation, for he protects the underdog, takes on the bully (by
the half-dozen, if necessary), neatly dispatches all and never bears a grudge.

Lily is a more flexible and less submissive person that she would seem on first 159*
acquaintance. The difficulty with knowing her is that she wears a completely 157
impassive, rigid, unexpressive mask before all. One morning after knowing her
for a year the writer walked by her and then stopped, mildly startled, for Lily
had smiled (slightly) and mumbled "Good Morning" under her breath. She is also [123]
less inhibited than this mask of impassivity would suggest, as is evident from
her behavior with her peers and parents, but in all instances she prefers to
communicate with slight gestures and to make do with very few words. She is,
in fact, a remarkably self-possessed, poised, and reserved adolescent girl, a
consequence of which is that she is far more graceful than many other local girls
her own age. But, generally, her responses only minimally involve her with 159*
others. She is always among people, but not always with them. Her reserve does
not dissipate much with continued acquaintance, but is a constant feature of her 156
mode of adjusting to others. She never talks freely and her terse responses to
the blots and TAT cards are paralleled by an equal economy in all personal re-
lationships. There is no evidence to suggest that she is suspicious or distrus -
ful of others, although she can be quite persistent in avoiding people she does
not like.

VIII Continued 159*

It LL brush. (Fire?) This bottom part. (Bottom pink & orange) () The color didn't help for the fire. () Down in my Dad's tribe they're medicine men. They go out in the hills and stand over a fire and sing and it's supposed to get whoever they sing for well. (11) Both side pink, D57. Just LL a bear climbing up a hill or something. Here's his front legs, and his rear ones, his ears and his face. 125

Conspicuous Features

(1) EB = 4:0
(2) 8 of 13R either M or FM
(3) 6 Pop
(4) Phobic responses (R6, R12)

Rorschach Interpretation

This adolescent girl — for whom "a smile is rare" — appears to be an intense, 159* introspective person: movement is involved in eight of her thirteen responses. 157 But there is insufficient responsiveness to external stimuli (no color responses with the possible exception of R10) and too much of her fantasy appears morbid or at least phobic ("Dracula" on Card IV and "monster" on Card X). Is she really [156] this terrified of authority? The test suggests "yes," but that she won't admit it readily.

159
157 There are no indications of peculiar thinking or intellectual impairment, but the total absence of color responses does reflect a poverty of emotional responsiveness. She appears to be a laconic, taciturn youngster. Her free associations are stated briefly and not spontaneously elaborated.

157 The Rorschach gives us, then, the picture of a stereotyped, overly conventional
156 adjustment. She is a "good" girl who does what she is told and uses her fantasy
to gain the little instinctual gratification she gets. The fact that her smile
[154] comes as she is describing "teenagers dancing" suggests that, like most youngsters
her age, peer relationships are particularly important to her and that this is
not an area of particular threat. It is probably the male authority figure who
is her difficulty.
*159

156 This protocol contains the first overt comment concerning an acculturation
177 process. One can perceive her distance from her father in her discussion of
R10; "...it's supposed to get whoever they sing for well." Her objectivity
here indicates that she is a part of the generation which is undergoing accul-
turation. She can apparently look, with distance, at her father's tribe's cus-
[121] toms. One wonders to what extent this cultural change is a factor in her diffi-
cult relations with her father, or whether — with Freud — it's the "universal
Oedipus complex" we see here.

This is a conventional record to the point of constriction: 5 or 6P; F plus per-
cent adequate; several M; no major shocks. Only the absence of color responses
stands out. We are left with the question of how and why this youngster has
[121] buried her feelings so completely? Although this is a brief record, we hazard
the guess that it is the stress of acculturation which has created the over-
control which characterizes this girl's adjustment (R10).

Section IV. Summary and Conclusions

In concluding this report rather than to attempt a detailed synthesis of all 121
aspects of the preceding case studies we intend to pursue some of the implica-
tions of certain striking characteristics of Klamath personalities. Aside from
this descriptive effort we also intend to derive, hypothetically, an association
between these personality attributes and Klamath acculturation experiences.

Certainly the most pervasively shared attribute of Klamath personalities is the 156
one we have chosen to call guarded restraint. This label is intended to desig- 157
nate the general attitude towards self and interpersonal relationships which has
emerged from the analysis of Rorschach records, life-history materials, and ob- [12]
servations of behavior. Guarded restraint, therefore, may be taken to mean the
prevalent suspicious and guarded attitude towards life of the Klamath subjects,
their wariness as regards significant others, and their apprehensions as regards
their environment generally. This attribute, as we conceive it, has many facets.
It includes an unconscious as well as a more deliberate muting of responsiveness
to the actions and the mere presence of others, a shallow, non-committal attitude
towards membership in various social groups and the goals of these groups, and
a characteristic which ranges from simple lack of trust to outright fear of the
behavioral milieu.

Stated in largely psycho-dynamic terms the notion of guarded restraint may seem 121
somewhat ambiguous. The empirical referents on the level of observable behavior
are, however, highly visible. They may be observed in a wide variety of be-
havior settings, from the informal and unstructured relations within a teen-
age clique or an adult drinking group to the more organized setting of the family
and household.

The psycho-cultural phenomena we have labeled as guarded restraint over-laps 121
with what others have called Klamath individualism. Seen in this perspective, 157
we may, perhaps, introduce a somewhat richer way of analyzing and gaining in-
sight into the nuances of Klamath behavioral styles. This approach is, we hope,
something more than just a different way of looking at the manifest separatism
and incohesiveness of family groups, a more fruitful manner of examining the
atomistic structure of Klamath reservation sodalities, and a means of appreciating
the psycho-dynamic causation of the constant fractionation of Klamath political
groupings. The evidence of these case studies, then, suggests that few Klamath [156]
are capable of fully identifying with other persons or of committing their loyal-
ties to concerted group action.

We feel that this major descriptive conclusion is, in large part, a product of 125
the case study method used in analyzing the Rorschachs. Moreover, it is our 128
belief that this conclusion could not have been obtained from an analysis of a
composite psychogram based on formal scores. As anyone who has ever read reports
based upon the statistical or modal personality approach well knows, such reports
are ridden with dynamic cliches and are largely sterile until filled out with
examples of the qualitative features of individual records. In this report
Levine has entirely discarded the lumping of group scores and concentrated upon
an analysis of qualitative features of individual records buttressed and suppor-
ted by the use of formal scores and relationships. The importance of this approach
is shown by the fact that the reserve and guardedness that characterizes Klamath [157]
does not always show up in individual test records in the same form. Most fre-
quently an important clue is had from the presence of restrained, watchful, wary
figures in human and animal movement responses. Indeed, this type of movement

125
128 response provided some of the first clues as regards this important personality attribute (Clifton 1960). But other test evidence, as well as life history and
[157] observational data, leads to the same conclusion, regardless of the presence or
[124] absence of a restrained movement response.

One facet of Klamath guardedness and restraint is the general reluctance of
157 Klamath individuals to reveal or communicate to others their needs, wishes, in-
156 terests, or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another characteristic of Klamath persons may be associated with this reserve. The reference here is to a general, overt, and conscious devaluation of the self. The Klamath sel-
[125] dom have much good and often much that is bad to say of themselves. Although this characteristic is not directly manifested in the Rorschach records, these records do indicate the presence of multiple and conflicting, or unacceptable prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
155 culture we consider that this characteristic is probably adaptive, although it might not seem so if measured against an ideal model of mental health based upon
65 the functioning of west European, urban, middle-class persons. Considering the
[171] realities of the Klamath situation, guarded restraint in itself may hardly be considered as pathological. Yet so great a reserve and so extensive an insula-
[158] tion of the self from important human transactions may be a major source of stress and may predispose Klamath individuals to variant forms of mental illnesses.

[157] Several of the cases contained in this report provide evidence for this hypothesis.
158 In the instance of Slim, for example, we find that a superficially adequate adjustment may simply be the manifestation of an obsessive control over and reduc-
[121] tion of emotional and intellectual processes to the point of a tentative diagnosis of alpha schizophrenia. The cases of Susan, Nell, Bidel and Sparrow are examples of extremely loose, unrealistic and disorganized thinking with overtones, in some instances, of an almost paranoid suspiciousness, or a reliance upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic role or personna which is very poorly integrated with the rest of the personality is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's superficial warmth. We suggest that these more disordered aspects of adjustment may profitably be seen, in part, as a function of a generally poor contact with others, reduced insight into the self and others, and extensive social isolation. The mediating difficulty may well be a relative absence of opportunities to validate beliefs and convictions. Thus in many respects adaptive, Klamath guarded restraint probably serves as a precipitating factor in thinking disorders, sociopathic adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

analysis of 53 Klamath Rorschachs and 33 Thematic Apperception Tests, with 128
additional evidence derived from participant observation and life history data [127]
(Clifton 1960). Moreover, the assessment agrees, in large part, with the observations and conclusions of other field workers working independently. The significant point is that Levine, working blind from records of persons he has never observed has reinforced and expanded upon previous evaluations of Klamath character.

A second hypothesis about the Klamath which arises from our study — an hypothesis 121
of which we are less certain when compared with the observation that they are
a people who may be viewed as guarded and restrained — is the finding that "in 157
the total kin network the influence of the male is weak..." and "whether or not 562
there is a male attached to the household group, the wife-mother is usually the
power figure." This finding, based on the anthropological data, is theoreti- [156]
cally congruent, almost startlingly so, with the fact that the more imaginative, creative, rich — healthy, if you will — Klamath Rorschach records were produced by the women in the sample, while the men's records were typically stereotyped
and constricted, and often unrealistic, disorganized or suspicious. The statis- [127]
tical comparisons (Clifton 1960) as well as the individual Rorschach analysis
(Chapter III) convey this impression very clearly. [128]

The importance of these findings can be viewed profitably in the light of con- 121
temporary psychoanalytic theory, especially in relation to the concepts of identification and modeling in child development. The theory holds that the child identifies with, i.e., adapts the characteristics, attitudes, and values, of his parents because he envies them; they are the powerful people who receive the rewards and gratifications which he is denied. In classical psychoanalytic theory, the boy is said to identify with the father because the father is the power figure in the family and receives the love of the mother. Although Freud never was as content with his psychology of women as he was with the Oedipus Complex, pre-
sumably similar processes account for feminine psychology. The classical Oedipus [128]
Complex has been modified in order to integrate more satisfactorily with cross-cultural data, and it is in this more flexible framework that the present results can be understood best.

In those societies in which the father is not a stable, respected member of the 121
family the process of identification is not as straightforward: the growing boy does not want to be like his weak father; he cannot identify with an absent father figure; yet he is biologically unable to be like his mother. The theory holds that his identification as a person will not be well integrated or complete.
In the Klamath family, the mother is the stable figure, the one who commands the 121
boy's respect. Since a consistent and integrated identification is needed for a
healthy development of the ego, we are not surprised to find that the males in 156
our Klamath sample show signs of poor ego structure. The women, on the other
hand, come off much better and one may hypothesize that they are able to make a 562
more integrated identification with the wife-mother figure in the Klamath family. 593

It may be necessary for a well-stated theoretical position to distinguish between 121
two qualities of the parent which are confounded in the present discussion: stability of the model on the one hand and the extent to which the parent receives rewards, on the other. The general theoretical position, however, states that those societies in which the father is more stable, receives more of the respect and material reward, or is more powerful will be societies in which the boys can
establish their roles more readily. On the other hand, in groups like the Klamath, 121
in which the father is weak or absent, we can expect to see signs of role conflict, 156
562
593

121
156 vague identification and, since it is largely through identification that the
562 super-ego is established, weak super-egos.

593 It has been suggested that what we have called guarded restraint may be a "front"
121 maintained only when Klamath are interacting with whites. The point is that
156 guarded restraint may be another name for the extreme suspicion and reserve of
many enclaved or colonized minority groups vis-a-vis representatives of the
177 dominant culture (Underhill 1960). It cannot be denied that, in fact, reserve
[171] and suspicion do characterize much of the relationship between Klamath and Whites,
but the reserve and restraint which so characterize Klamath persons is not solely
a function of such situations. We agree that guarded restraint is one important
consequence of acculturative contacts, but the evidence of observation and life
histories clearly indicate that this is a personality attribute manifest in many
[829] situations exclusive of the presence of outsiders. Life history subjects, for
example, speak of the "Indianness" of their parents, meaning precisely an aloof,
reserved style of interaction. Many other informants verbalize reactions to the endemic if latent suspiciousness of Klamath life. Thus guarded restraint is not purely an observer construct with a referent limited to the test situation. Certainly, a measure of reserve and suspicion may serve utilitarian functions when interacting with strangers, but the same characteristic makes strangers out of neighbors.

121 Underhill's suggestion does raise the issue of a broader connection between
156 guarded restraint and the impact of acculturation. If there is such an association then we should expect to find these attributes widely distributed among
177 other acculturated populations, especially those which have been exposed to the
171 imposition of external political and administrative controls, and deculturation
or detribalization. That there may be some validity to this hypothesis is sugges-
157 ted by the fact that attempts to communicate our findings to observers with experience among other acculturated populations frequently evoke memories of similarity in character. What we have called guarded restraint has been suggested as characteristic of the contemporary Southern Ute (Stewart 1961) and especially the Mountain or Towoac Ute (Canan 1961), and of the Cree, Northern Athabascan, and Eskimo (Heinrich 1961). In each instance there are differences, but differences which seem to play upon a common theme.

Personality attributes analogous to what we have called guarded restraint have repeatedly been discerned among other more or less acculturated North American Indian populations. Thus Barnouw describes the Wisconsin Chippewa as emotionally isolated, suspicious of outsiders, and fearful of expressing emotions overtly (Barnouw 1950: 22-23). Klopfer's analysis of Chippewa Rorschachs suggests that "...the individual is under pressure to become as emotionally independent of his environment as possible, and to expect very little from others." (Barnouw 1950: 27). The Ojibwa have been described as emotionally restrained, suspicious, and anxious (Hallowell 1955: 350). Hallowell's interpretation of these characteristics is that they constitute persistent aboriginal components of Ojibwa character structure. In a similar fashion, the Native-Oriented Menomini have been described by Spindler as a group characterized by a non-defensive reduction of emotional display, whose perception is narrowed to only a very selective portion of their environment, and who are further characterized by a non-manipulatory passivity. Outside of the presumed character structure of the Eastern Woodlands, the most widely distributed "aboriginal" characteristics of North American Indians, generally, are given by the Spindlers as non-demonstrative emotionality, great reserve, individual autonomy, and a generalized fear of the world as dangerous (Spindler and Spindler 1957: 148).

On the face of these parallel descriptions it would seem that the Klamath are 121
similar, as regards guarded restraint, to a variety of differently situated, 156
differentially acculturated North American Indian populations, populations with
diverse cultural heritages. These similarities are, of course, susceptible to 157
different explanations. It would be a simple matter, for example, to explain
away the similarities as false, that is, as being a function of unreliable tech- 171
niques of assessment and highly ambiguous descriptive constructs or constructs 177
lacking in validity. Aside from being no explanation at all, this approach would [114]
involve discarding most of the available cross-cultural psychological data as
well as existing assessments of the personality dynamics of North American Indians.
Although this is the course advocated by many methodological puritans in the area
of culture and personality research we choose to accept the similarities as valid.

A second way of explaining these similarities might invoke the assumption of an
underlying "North American Indian" character structure or basic personality ana-
logous to Devereux's delineation of a core personality type for the Plains
(Devereux 1951). Accepting this assumption the persistence of core traits must
then somehow be accounted for. In the instance of the Plains, Devereux presents
one possibility, namely that acculturation has resulted in a "stripped-down"
and impoverished personality type (Devereux 1951: 25). Somewhat differently,
Hallowell and his followers have argued that basic personality somehow manages
to weather the vicissitudes of history and acculturation (Hallowell 1955: 309;
Spindler 1955: 151). The common feature of both of these explanations is the [114]
assumption of an underlying, basic set of psychological characteristics linked
to aboriginal prototypes and common to the population occupying a given culture
area.

In the instance of the Klamath there is very little evidence to suggest, un- 121
equivocally, that guarded restraint was a dominant component of aboriginal char- 156
acter structure. The information is scanty and points to the definite presence
of great reserve and considerable suspicion, but only as one mode of interper- 157
sonal relations among others. Moreover, the Klamath reservation situation does 177
not allow a comparison of differentially acculturated groups after the model
used by Hallowell for the Ojibwa, and the effort to apply Spindler's technique [657]
of an internal comparison raised more problems than it resolved in this setting.
Finally, the evidence from the Klamath psychological data indicates that, if [171]
anything, older members of the tribe are less reserved and suspicious. In short,
we cannot assert from available evidence that guarded restraint was basic or
dominant in aboriginal Klamath character structure. We suggest that at minimum
this characteristic was present, but that it did not receive the emphasis it
now gets.

Aside from this difficulty, there are a great many conceptual problems associated 121
with the postulation of an underlying, basic trait of guarded restraint for the 156
North American Indians generally. We feel that it is stretching the point to
attempt to account for present similarities among unrelated cultures of such 157
different cultural heritages with a construct so broad. Due to the absence of 171
firm measures of aboriginal character structure this approach to explanation also
involves substantial methodological problems which are not easily resolved.

Instead of explaining contemporary similarities in either of these ways it is 121
possible to view modern Indian populations in the light of common acculturative 156
experiences and their status as dependent wards, as enclaved minority groups,
and as persons who have been promised much but who have attained little. Spindler 157
has suggested that when acculturation conditions permit both a ready identification 171
177

121 with the values of the dominant culture and provide access to the institutionalized
156 means of attaining desired goals there will be a successful psychological
157 adaptation to dominant standards, but that when these conditions do not exist
then there may be overt change in the content of culture unaccompanied by changes
171 in psychological characteristics (Spindler 1955: 199). In the same way, Hallowell
177 suggests that constant association with powerful external agents, multiple
conflicting sources of reward and punishment and the ridicule and invidious comparisons
which too frequently accompany acculturation situations may result in
extreme feelings of insecurity, personality maladjustment, and what he calls the
"frustration of maturity" (Hallowell 1955: 329).

Spindler's dual hypotheses are, of course, not the only alternative consequences
of acculturation situations. We feel that between these polarities there are
different modes of adaptation open, modes similar to those suggested by Hallowell.
[178] We therefore assert, hypothetically, that the defensive, guarded, reserved
style of interaction now characteristic of the Klamath is the product of
the deterioration and decay of major patterns of aboriginal Klamath culture, a
prolonged exposure to and considerable identification with the values and standards
of the dominant White society, and the persistent denial of access to the
means and instrumentalities necessary to achieve these goals and to live up to
the standards. We argue, in this way, that there are a great many similarities
between diverse American Indian populations as noted by many observers, that
these similarities do not constitute the residue of generic Indian character
traits, but that they are a function of a common depressed minority group status
within contemporary American society. Our analysis of this is that these components,
specifically, the guardedness, the reserve, the suspicion, and the lack
of involvement in creative group activity, are very much analogous to what various
sociologists speak of as alienation or anomie (Merton 1957: 121-194; Nettler 1957;
Seeman 1961).

000 on nature, physically and mentally, than we are. What distinguishes the civilized man from the primitive man of our days and of prehistoric ages is his greater faculty of turning to account the patent and the hidden powers of nature, or the invention of handicrafts, arts, and sciences. In this the savage man lags far behind the man of culture, and although we often have to admire the ingenuity and shrewdness displayed by the American native in his hunting and fishing implements and practices, the art of agriculture, without which there can be no real human culture, has never been pursued to any considerable extent by the Indians living north of the thirtieth parallel of latitude.

512
157 The climate of their home compels the Máklaks Indians to lead an active and laborious life. Except in the coldest days of winter they are [147] almost always engaged in some outdoor work, either hunting, fishing, or cutting wood, gathering vegetal food, or traveling on horseback. Pursuits like these and the pure, bracing air of the highlands render their constitutions hardy and healthy, their minds active, wide awake, and intelligent. They are quick-sighted and quick in their acts, but slow in expressing delight, wonder, astonishment, or disgust at anything they see. Often they do not grasp the meaning of what they observe being done by the white people, and thus appear to us indifferent to many of the highest attainments 177 of modern culture. Children and adults are prone to reject or slow to adopt [178] the blessings of civilization, because many of these are of no practical use to a hunting and fishing people, and others are past their understanding.

The first things they generally adopt from the white people are the citizen's dress and handy articles of manufacture, as beads, tobacco, knives, guns, steel traps; also wagons and other vehicles; for when in possession of these last the horses, which they had obtained long before, can be put to better account They are also quick in adopting English baptismal names, sometimes discarding but oftener retaining their descriptive or burlesque nomenclature from the Klamath language. Gradually they adopt also with the money of the white man the elements of arithmetic, and learn to compute days and months according to his calendar. After another lapse of time they introduce some of the white man's laws, discard polygamy and slavery,

177 bury their dead instead of cremating them, and commence to acquire a smattering of English. Indian superstitions, conjurers' practices are not abandoned before the white man's ways have wrought a thorough change in their minds; and a regular school attendance by children can not be expected before this stage of progress has been reached.

157 [721] In his moral aspects the Klamath Indian is more coarse and outspoken than the white man, but in fact he is not better and not worse. He has attacked and enslaved by annual raids the defenseless California Indian simply because he was more aggressive, strong, and cunning than his victim; his family relations would be a disgrace to any cultured people, as would also be the method by which the chiefs rule the community. But the passions are not restrained among savages as they are or ought to be among us, and the force of example exhibited by Indians of other tribes is too strong for them to resist.

121 157 The character of men in the hunter stage depicts itself admirably well in the mythic and legendary stories of both chieftaincies. Low cunning and treacherous disposition manifest themselves side by side with a few traits of magnanimity hardly to be expected of a people formerly merged in a sort of zoolatric fetichism. There is, however, a considerable power of imagination and invention exhibited in these simple stories, and many of the ferocious beasts are sketched in a truly humorous vein.

Man's morals are the product of circumstances, and the white man who judges Indian morals from the Christian standard knows nothing of human nature or of ethnologic science. The moral ideas of every nation differ from those of neighboring peoples, and among us the moral system of every 000 century differs from that of the preceding one. The fact that the Modocs showed themselves more aggressive and murderous towards the white element than the Klamath Lake Indians may thus be explained by the different position of their homes. The latter being more secluded have not molested Americans sensibly, whereas the annals of the Modocs, who lived in an open country, are filled with bloody deeds. They are of a more secretive and churlish disposition, and what Stephen Powers, who saw them shortly after the Modoc war, says of them is, in some respects, true: "On the whole,

157 the characteristics of the blot been organized intellectually and to what extent
125 is he unable to accomplish this analysis? If he cannot accomplish this, there is a disorder of thinking present. Also, his response to Card II: the whole looks like an island, and the red looks like fire, therefore it looks like "fire on an island." At best it is a fabulized combination; at worst it is a contamination. Only a blatant schizophrenic would have gone to the pathological extreme and said "Fire Island." In addition there are no movement responses, there are only three popular responses and the F plus percent is only 56. Where are the control factors? The sum of color responses is 6; the sum of dark shading responses is 5; and there are not the indications of sufficient controls for this amount of emotional energy.

157 On the other hand, there are a few responses which suggest that his intellectual
153 ability has been greater than average. His knowledge of the word "obsidian," for example, bespeaks this ability,[1] as does the nature, although perhaps not the feasibility, of his "plans." This is not inconsistent with the statements made previously, but it does suggest a situation marked by increasingly greater interference with intellectual functioning.

157 The absence of any human responses in his Rorschach suggests his lack of concern with genuine interpersonal relationships; all his talk of future plans and busi-
* 159 ness suggests that he is interested in using people for his own gain rather than in having meaningful and warm interpersonal relationships. His reaction times are quick, supporting the notion that he is likely to act in an impulsive manner. Two of his FM (R2, R7) are "flying," reflecting perhaps his tendency to try to escape from the present situation in an unrealistic manner. His other FM response (R1) may be an indication of his view of human relations: aggressive, cold-blooded, eat or be eaten.

In summary, then, the test reflects an elderly man, whose intellectual and emotional control appear inadequate. One wonders about the possibility of this man
158 having been a chronic alcoholic and now suffering the effects of diffuse organic brain damage. He "talks big" but he probably doesn't "deliver the goods." There are indications that at one time in his life he may have had better than average intellectual ability and now is going downhill.

---

114 [1] This is, perhaps, the one place in these ten cases where a lack of knowledge concerning Klamath culture led the analyst astray. The Klamath are astride the western volcanic belt and one of the most frequent kinds of materials used in
823 their tool manufacture was obsidian. Hence Sparrow's use of the word reflects his interest in and awareness of an important local raw material.

[157] very extreme when compared with white American Rorschach protocols. What is
*[159] the meaning of this delay? What psychological processes are going on in the
interim? Her subsequent rapid delivery of varied and generally appropriate res-
(125) ponses suggests that she is, in fact, concentrating on the task at hand and
arriving at feasible solutions to the task which the examiner presented to her
("What does this look like to you?"). However, the question remains: why doesn't
she talk during this process?

[152] One thing we know: she isn't apathetic or disinterested. On the contrary, underlying her delay, there is considerable feeling. Not only does she give four CF responses, but she gives diffuse responses to the blackness and shading elements of the cards. Her first responses to Cards IV, VI, VII, and VIII are vague, whole responses with little, if any, form element involved. Her delay and control do not allow her to succeed in integrating her feelings and impulses with the objective demands of the situation. In R17, for example, we are able to see the manner in which her mental processes may, on occasion, totally ignore the environmental requirements for appropriate behavior. Her response here is "pictures of duck hunters." On inquiry we learn, however, that there are no ducks and no hunters — only fog. Her perception, then, was of a vague, foggy, diffuse world; she enlivened it and peopled it in an elaborate manner through her own rich imagination. To what extent will she allow this rich imagination to overwhelm the demands of the external world? Her Rorschach responses indicate that this will occur often in a sporadic fashion, but that she will be able to recover from these periods and correctly evaluate the situation once again.

This over-ideation, — especially in the light of R26, "men plotting something" — suggests a distinct paranoid trend. She is suspicious of the motives of others and fearful of what the future has in store for her. Even natural forces are considered powerfully threatening; R20, for example, indicates that lightning is "trying to strike" the house.

An analysis of the roles reflected in the human movement responses suggest that this woman has managed to adopt a wide variety of role patterns. She has human movement responses which are verbally aggressive (R26), grasping (R3), guarded (R9), totally immobile (R15), as well as complex (R23). It is this rich, imaginative fantasy life which enables her to delay responding to the blots for such a long time. The reason she must delay is that she does not trust the environment and the people in it.

Some of her movement responses demand more careful analysis. Three of the eight
M are old ladies or witches; witches "are old and mean," she tells us. Since her
very first response to the test is also a "witch," it would be remiss not to try
to determine the personal significance of this response. We are probably on
reasonably safe ground assuming that it reflects her attitudes toward older
women and therefore some kind of mother figure. Her mother could not have been
very nurturing or warm, nor is she likely to see herself as a particularly nur-
turing person; she does not feel comfortable giving emotionally to others. On
the other hand, R3 suggests that she is not content to "do without." If rewards
•[158] do not come easily, she is ready to "reach out" for it. At the same time, how-
ever, we must note the content of R15: "two girls sleeping...resting...laying."
Piotrowski has warned of the pathological significance of this kind of immobile
human movement response, suggesting as it does, a willingness to submit to the
external forces without a struggle.

Her animal movement responses are also suggestive of a suspicious and hostile role pattern; of the three FM, the first (R7) is "an animal looking over

Rorschach Interpretation

*159 157 Aggressiveness, almost of a murderous kind, is the first impression one gets from this Rorschach record. Despite the fact that he gives only nine responses, we finish reading the record with the feeling that we know a great deal about this man, but we are no longer convinced of the extent to which he is comfortable with his feelings of hostility.

[158] Perhaps the single most conspicuous feature of the record is the blatant preoccupation with violence, especially in the context of such a brief record and in the light of the personalized quality of the verbalization: "When you press the gun up close to something and it goes off and makes this powder burn — the red spots look like blood." In addition to this hostile content (R3 and R9), analysis of the scoring summary indicates that the subject has inadequate control of these impulses. His Sum/C is 4.5, which is very high in a record of only nine responses, and there is no M and only one shading response. (After much deliberation, it was felt that there was insufficient evidence to score shading in R5.) Furthermore, only one of his responses was determined by the shape of the blot alone, indicating that in practically all situations the subject is likely to be directed by impulses and feelings, rather than by intellectual considerations. The possibility that the seven whole responses constitute ego control and personality organization is contradicted by an inspection of the nature of the W. Of these seven W responses, five and possibly a sixth must be considered vague, diffuse, primitive responses to the global impression of the blot.

There are a few possible indications of some control mechanisms which operate sporadically, however. For one thing, he does not blurt out his responses impulsively; there are relatively long initial reaction times to all the cards. Secondly, he does give attention to the shading elements (R2 and possibly R5). Nevertheless, these constitute insufficient controls for the tremendous energy available (Sum/c:Sum/C = 2:4.5).

The long initial reaction times, the few R and many of the verbalizations point to a guarded, suspicious approach to life. This finding, combined with the absence of M, is strongly suggestive of a paranoid adjustment. Life in general, and human relationships in particular, is seen as a struggle: the response closest to an M is the "fighting blackbirds." However, the subject does not have very strong attitudes about interpersonal relations. His feelings about people are shallow and ill-defined. He does not have close friendships: the figures on Card I, often seen as human, are seen by him through transparent jelly; he rejects Card III suggesting a human movement shock; and his few R suggest that he is unwilling to extend himself in the test situation.

[156] The "coat of arms" response suggests that what little feeling he has for human relationships is focused on the overt signs of social status. He is likely to

be very much involved with how he appears in the eyes of others. This attitude, 159*
together with his hostility and lack of impulse control, may get him into con- 157
siderable trouble through inappropriate attempts to attain some semblance of [156]
what he considers status. This may appear as "attention-getting" mechanisms.

There is no need to ponder the question of whether this man is actually the aggressor or the victim. He is both. At times, he probably instigates the trouble. But just as often he is likely to be punished for his transgressions. On occasion he may act aggressively as a result of some fancied aggression. He doesn't trust anyone; no one is likely to trust him. He is essentially an isolated person. His minority group status probably fits easily into this conception of his role in life and his essential feelings of isolation and rejection. [156]

However, his last responses (especially R6 and R8) appear to raise doubts about some of our interpretations. These almost effeminate —artistic, at least — color responses: "coral rocks" and "modern art," coming at the end of the record as they do, indicate that beneath this belligerent facade, we may come upon gentleness, sensitivity, and passivity which might surprise us. He is capable of moments of deep positive, perhaps aesthetic, feeling. We must raise the hypothesis that this young man is really a "softie" who is trying to deny this trait in himself or, in other words, he is just a big bluff.

This pattern may suggest the psychoanalytic hypothesis of paranoia, namely repressed and projected homosexuality —if we define sexuality in broad enough terms. The suspiciousness, belligerence, interpersonal isolation and latent aesthetic sensitivity all are consistent with this notion. At least some sexual disturbance seems indicated by the way he mutilates the fox skin on VI; all the extensions are cut off. [158]

One aspect of this record remains puzzling: the relation between the c and c'. We get dark shading (c') on at least two occasions (R3, R9) and light shading on at least one (R2). If R5 is scored light shading, there is a balance of dark and light shading responses and indication of anxiety, control and neuroses. If, on the other hand, R5 is a dark shading response, the balance of determinants becomes even more extreme in the direction of lack of control. Piotrowski's principle is that the c' are given by people who fight rather than flee from anxiety provoking situations. My overall impression is that this subject is more likely to behave in the "fight" manner and thus get himself into a considerable amount of difficulty, but the possibility that R5 is a shading response is unsettling.

The m response on Card IX, when interpreted according to Piotrowski's principles, indicates that the subject would like to "explode" but feels incapable of this kind of behavior. Since this is a subjective feeling, it does not contradict the position that he does act out in an uncontrolled manner; rather, it suggests that, despite sporadic outbursts, he feels tense, as if he is operating under a constant head of steam that doesn't let up, even when he does blow off on occasion.

This m, the possibility that R5 is a c response, and the positive affect expressed in R6 and R8 indicate that, although the subject has violent moods, he is far from comfortable in this role. He is tense, anxious, frightened. There may be something about him which, at times, another person can understand and sympathize with.

In general though, he is wary of others, they are wary of him, and "trouble is brewing." [156]

Rorschach Interpretation

*159
157 The Rorschach reflects a woman who is extraordinarily preoccupied with disease (at - 10+5). If she is not physically ill, she is hypochondriacal and perhaps suffering from somatic delusions (at R; F+%, 52). She is likely to be very ill at ease in interpersonal relationships (M on Card II), probably because she is demanding of attention from others (C:CF:FC). I wonder if she doesn't use physical illness in order to be taken care of.

[156] The test results indicate that she views interpersonal relations as terrifying struggles in which she may be "demolished" by others. Since her only M in human content is "a couple of men testing their strength" and her Sum/C:Sum/c is 3.5:0, we would say this is how she acts in interpersonal relations at this time. She "tests her strength" — but cautiously. The figures are "in disguise," they are not to be trusted. In meeting people she has to decide whether she is strong enough to be safe, or whether they are so strong that they would harm her.

The FM, on the other hand, are aggressive "climbing up to demolish something," "germ attacking the lung," "bugs attacking throat." This is the enormous aggressiveness of which she is afraid, but it also indicates that she is capable of experiencing this kind of hostility toward others. Under stress or "in states of diminished consciousness" we may see some extremely aggressive behavior on her part.

Since I scored R20 as a pure C response and there are 2CF and no FC, we must conclude that S does become overly emotional at times. They may be "crying spells" or expressions of the anger indicated in the preceding paragraph which she is unable to control. I scored R8 and R12 as Fc' but they may be Fc. If they are Fc' they support the notion that our S has little control over her feelings. The great variability of her initial reaction times also bespeaks of sporadic impulsivity and feelings of anxiety.

*159
158 The more one thinks about it, the more pathological the picture becomes. F plus percent is only 52 despite the 6 populars; there is a positional response on Card IX; there are a few peculiar verbalizations, e.g., the vertebrae and brain being referred to as "the center of man's being" and "the main part of life and

the person's being;" there are overly emotional reactions to blots: "it's terrifying 159*
if some kind of disease attacks you." And finally all the color comment 158*
indicates she is affected by the color but cannot integrate it appropriately.
Thus, she responds emotionally but cannot bring these feelings under control.
A statement of her feelings of impotence or "intellectual passivity" (Piotrowski
1950) is her comment on Card III: "But why the grasshoppers should be playing,
I don't know."

Are there any personality strengths to balance this pathological picture? Just 159*
the six popular responses. These are liberally sprinkled throughout the record. 157
We would have to conclude then that she is generally able to respond in a socially
acceptable and conventional manner. However, the somatic preoccupations and
poor emotional control are evident throughout. She seems to make an effort to
maintain satisfactory relations with others. She is ready to accept responsibility
for difficulties ("You know my trouble is I don't read very much"); although
distanciated, her second M response is the pleasant "grasshoppers playing;"
she does respond positively to the "lovely coloring." However, these are all
based on content, rather than determinants, and as such are probably much more
superficial indicators.

This personality description would not be complete without at least some comment 121
concerning the possible influence of the age of the subject and the role expectations
of this age group among the Klamath. Since this analysis has been done 888
without the benefit of this latter information, it can only be remarked that, to 157
the extent that elderly people are allowed greater latitude in their behavior,
to that extent this woman's adjustment will be considered acceptable, rather
than pathological. In any case, however, she is probably terrified by disease
and death. One wonders if the change in cultural attitudes toward disease and
death may have left her bereft of a set of beliefs which might have helped her
at this point in her life.

125
128 response provided some of the first clues as regards this important personality
attribute (Clifton 1960). But other test evidence, as well as life history and
[157] observational data, leads to the same conclusion, regardless of the presence or
absence of a restrained movement response.
[124]

157 One facet of Klamath guardedness and restraint is the general reluctance of
157 Klamath individuals to reveal or communicate to others their needs, wishes, in-
156 terests, or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another character-
istic of Klamath persons may be associated with this reserve. The reference here
is to a general, overt, and conscious devaluation of the self. The Klamath sel-
[125] dom have much good and often much that is bad to say of themselves. Although
this characteristic is not directly manifested in the Rorschach records, these
records do indicate the presence of multiple and conflicting, or unacceptable
prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
culture we consider that this characteristic is probably adaptive, although it
155 might not seem so if measured against an ideal model of mental health based upon
657 the functioning of west European, urban, middle-class persons. Considering the
[171] realities of the Klamath situation, guarded restraint in itself may hardly be
considered as pathological. Yet so great a reserve and so extensive an insula-
[158] tion of the self from important human transactions may be a major source of stress
and may predispose Klamath individuals to variant forms of mental illnesses.

157 Several of the cases contained in this report provide evidence for this hypothesis.
158 In the instance of Slim, for example, we find that a superficially adequate ad-
justment may simply be the manifestation of an obsessive control over and reduc-
[121] tion of emotional and intellectual processes to the point of a tentative diag-
nosis of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are examples of extremely loose, unrealistic and disorganized thinking with overtones, in some instances, of an almost paranoid suspiciousness, or a reliance upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic role or personna which is very poorly integrated with the rest of the personality is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's superficial warmth. We suggest that these more disordered aspects of adjustment may profitably be seen, in part, as a function of a generally poor contact with others, reduced insight into the self and others, and extensive social isolation. The mediating difficulty may well be a relative absence of opportunities to validate beliefs and convictions. Thus in many respects adaptive, Klamath guarded restraint probably serves as a precipitating factor in thinking disorders, sociopathic adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

by the death of several on each side, the feud continues until payment 726
is made. Continued feuds prove disastrous, for retaliation is carried 628
out with all the intensity and destructiveness of a foreign war. Villages are attacked at dawn, houses and property destroyed, women and children carried away into slavery.

A chief may intervene; so I was told, though I doubt it. Chiefs do 728
accompany parleying parties and other men may echo their words. 622
Beyond that there seems to be nothing to their position but personal prestige which has been enhanced by developments since reservation days. Lɛle'ks and his successors among the ă'ukekni seem to have made much of their position. Pat's father and Te!i'wi, both du'kwakni, killed a iu"lalonɛ man at stö'kmatc, Eagle Point. They were taken to Klamath marsh and each beaten five times at the order of this chief. This was in pre-reservation days, or at least prior to the establishment
of the agency in 1864 (?). Nevertheless this is not aboriginal, but, [177]
according to Nancy Phillips, these "laws" were brought by her cousin from the north.

The group that owes recompense, having lost fewer men, goes to 728
the other offering payment to even the score. The value of a man's life is not a fixed item, as it is for the lower Klamath river tribes; this despite the similarity of marriage payment and the slur on children not born of a purchased mother. My informants professed ignorance of what should be paid, yet it can hardly be doubted that recompense accorded with a man's wealth and prestige.

Children who are captured are kept; settling the score does not mean that they are restored, though this may well be only in case they have been sold. Their fate depends on their captors, who may elect to rear them as their own children. More commonly they are miserably treated, made to sleep with the dogs, fetch water, etc., and beaten if
they are lazy. They are as quickly sold at Warm Springs and the [437]
Dalles as are foreign captives. With the latter at least there is an advantage in immediately disposing of them, that they do not grow up to carry back to their own people precise knowledge of the habits and topography of the Klamath world.

Kö'kdiŋks of du'kwa was a chief (lö'ki) in warfare. He would tell his tribes- 159 •
men to get ready to fight with the iu"laloŋkni, *for instance*. He was always 701
in the forefront of battle. When a youth he went out to seek power by bathing
and wandering through the mountains at night. His mother had told him that 721
long before those of iu"lalonɛ had slain his father, Lë"l'wis, a du'kwa shaman accused of poisoning one of them. He wanted to become a warrior to have

159 revenge. While he was swimming in deep water at du'kwa he found a human
701 leg in his grasp; it had been given him by the ghosts.[40] Then he became
721 ''mean,'' revengeful, and led his people down the lake to iu'ʻlaloŋɛ for vengeance.

He grew aggressive and attacked gu'mbŏt, kowa'edi, and other towns. He
was a hard man to hit; they could not kill him in open battle. His du'kwakni
159 band went up Williamson river to the ă'ukekni town at bæzūkse'was. Before
the fight opened, Po'moks, an ă'ukekni from far up Sprague river, came
701 to him and announced that he would join him. Kŏ'ḳdiŋks agreed because he
was a relative. During the battle Po'moks slipped behind Kŏ'ḳdiŋks and shot
726 him. That was the only way they could best him; since then there has been
no feud with du'kwa.

Quite in accord with Klamath custom, Kŏ'ḳdiŋks band was accompanied by a du'kwa shaman named čḳts'as. When one of his side was shot, this shaman ran to him, extracted the arrow, and sucked the wound.

726 Pat's uncle of gu'mbŏt and Nancy's father of du'kwa went to iu'ʻlaloŋɛ where they killed a man.

Some gu'mbŏt men went to Buck island and killed a man there. Immediately a party followed them back and killed a man at gu'mbŏt.

A brave man from du'kwa lived at gu'mbŏt. The gu'mbŏtkni traveled with him to kill iu'ʻlaloŋkni, ă'ukekni, and kowa'edikni. He stole women everywhere, carrying them to gu'mbŏt as his wives. He tried to kill some gu'mbŏt men whom he accused of tampering with them, but they dispatched him. After he was cremated all these women returned to their homes.

An attack might be expected at any time. The Upland Takelma (Ha'nis or Wa'lŭmskni), for instance, raid the Williamson river district. Crossing by the ridges south of Crater lake, they travel down the ridge separating that river from Klamath lake. From this eminence they can see the smokes of a large part of Klamath territory. Gatschet describes such a raid, plausibly dating it between 1848
175 and 1855.[41]

726 The Takelma descended on bæzūkse'was in the middle Williamson valley at salmon fishing time. Most of the warriors were away at Klamath marsh to welcome some northern Indians. Crossing the river the Takelma attacked at dawn, killing a few old people, but they were put to rout by the fierce onslaught of but five cuirassed Klamath, men of nilŭksi, the Modoc Point district. They were pursued by the whole force of Klamath, hastily summoned from the marsh. Some escaped, others were found dead of starvation or wounds where they had hidden in the mountains.

Five old women were once left behind at Klamath marsh to gather lily seeds. They brought their canoes down to the falls, as far as they could go. All they could not carry they buried there to leave through the winter. A Paiute lurking on the opposite bank followed them down to the falls. He killed all five with his arrows. When their relatives found them overdue, they went to search. The Paiute, having stayed in the neighborhood to steal horses, was tracked and killed.[42]

---

[40] So my informant said, but she surely meant spirits.

[41] The Klamath Indians, 1:16-18.

[42] Gatschet records a similar Paiute raid on Williamson river or perhaps the same (1:28).

á'ukekni were sisters from his own settlement on Williamson river above 582
bʌzükse'was, a third was from that town, and the fourth from glă'tspak'is, a 595
mile or so down river. His daughter by the Modoc wife was counted á'ukekni;
while living at k'taidi she married an á'ukekni of Yainax.

A gu'mböt man, Wokau'k!alls, married two Molala sisters.

Girls usually marry within a year or so after puberty, which is marked, at least among the well-to-do, by a big dance. Betrothals may have been arranged while the couple were yet pre-adolescent, presents having been exchanged by the families. They are expected to carry out the agreement after the girl's dance, payments being made again. Should one of them die another match may be arranged with the same family, but not of necessity. Poor and rich alike arrange such betrothals. 584

How far great disparity of age occurs I do not know, but it does happen that an older man marries a young girl. A shaman for instance may be given a daughter by a man too poor to reward him otherwise. [582] [756]

But it must not be thought that there is no choice. On the contrary, the majority of marriages follow the desire of the couples. Elopements take place and although the levirate is the rule, much depends on the widow's willingness. Yet a girl's consent is not necessary. Despite her protests she may be carried to her husband's home. If she runs home she is almost invariably taken back again. That she would be driven to suicide is doubtful; one informant never heard of such a thing; another stated she would hang herself and in this event her parents had to return the gifts of the groom. 583 587 [762]

An orphan girl of du'kwa lived with her mother's brother. She was married against her will to a man of k'taidi. She clung to the ladder of the earth-lodge but they pulled her away and dragged her up-river to k'taidi. Next morning she ran home and never went back. Nothing had been paid for her at the time but she was given in return for valuables contributed to the cremation of a relative of hers some time before by her husband's relatives. Immediately after this she married a man at Klamath marsh; whether payment was then made is not remembered. 583 159

Elopements occur but payment is so much insisted on as a sign of respectability that parents guard their daughters with great care. This is at least true where the family wealth makes a suitable payment imperative. It is unthinkable that a chief's daughter should be permitted to enter an unceremonious, clandestine union. The poor and forward have little to lose. Modest demeanor is expected of a girl. 583 834

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

834 836 [881] She dances with downcast eyes in her adolescent rite; she sits apart and does not talk with male visitors at home. A man seen prowling about the camp is shouted away. A girl who does not wish to be molested will go over to her mother to sleep. A father will whip a daughter who has clandestine visitors, and his son for misconduct. No obligations may be assumed for which no payment is made.

583 [836] Despite the fact that elopements are frowned on, clandestine visits and elopements are frequent. The girl's parents may follow a runaway couple and force her to return with them. It is usual however for the families to accept the fact and make gifts in proper form.

583 • 159 585 The most lavish marriage display ever known was that of Lɛle'ks' only daughter, Go'solülb. They were living at táka'lmakeda during the fishing season when Ski'lüls of Yainax eloped with her. They fled riding double; the horse fell with them while fording the river, but they escaped to Yainax. Soon after the girl returned alone. It took a month to get ready to conduct a proper marriage. Lɛle'ks made the trip across the mountains to Jacksonville to get store goods. A great many people went with them to Yainax, the majority taking gifts of horses, blankets, clothing, or anything they had. One man with nothing better stripped himself of his only shirt. It must be remembered that such Plains shirts were then newly fashionable and hence valuable. They gave the horses they rode there, hoping for reciprocal gifts on which to return. Horses to a total of ten were given the groom's people. They gave horses and other gifts in return. Payment having been made the affair was considered as honorably ended, and as though the groom had sent an emissary in proper order.

583 554 Marriage without payment brings a slur on the children to be cast in the teeth by quarreling women. "Your children are worth nothing; you were not bought." Children taunt each other in the same way. They are respected in proportion to the amount changing hands at their parents' marriage, but this does not mean that a man's life is assessed at this sum. Nor is there any suggestion here that husband and wife are financially accountable to each other for injuries to their children. Marriage payment is prescribed not alone because it fixes social status in a general way but because, as one informant phrased it, it is decidedly unlucky not to make payment. So it is, for the couple have made an unsuccessful start of their social career.

The amount is not prescribed but varies with the wealth of the individuals. A chief gives a slave and more; a poor man buys with food. A chief will not give his daughter for nothing; the groom must
583 continue to bring gifts even after marriage. The valuables customarily exchanged are slaves, horses, blankets, beads, food (pond-lily seed and roots), elk and other hides, and strings of beads. Pat Kane's father gave five fathoms of glass trade beads. It is important to

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

756 838 As both sexes are shamans there was no need for the transformation had this been the goal.

Mūksamse'lapli, also called White Sindey, was the berdache shaman. He tried to laugh like a woman. He was twice married, first to a Molala man named Tel'ptcl, later to a Klamath, Tc!o'möks. The latter is known to me as a normal old man who has since raised a family of his own. White Sindey made considerable pretense to shamanistic powers, but was rather scouted. He performed and reacted like an ordinary shaman.

159 838 One of my informants now in his sixties had been a berdache in his youth. I had observed his general unmasculine behavior but it was not until my visit of the second year that another informant gave the reason. He lives alone, takes pride in his cooking and the care of his house, weaves baskets for sale as women do, and still wears a basket hat, which no Klamath man now will. He is fleshy, slow, and distinctly feminine in gait and gestures, and speaks with the higher pitch of women's voices. Yet his transvestite state was given up nearly half a century ago. He is shrewd enough, though mild mannered, yet I confess that I suspected no abnormality. When about sixteen years old he was at the Dalles where an old woman shaman of the place took a fancy to him. He however was afraid that she would harm him so he put on woman's dress. He wore his hair long, prepared lily seeds, wove mats and baskets; all typical women's pursuits. He has never married. After learning his history I brought up the subject of marriage with him. He claimed that he had once been married, his wife having died twenty years ago, and in answer to the question why he had not remarried replied: "Some men like it that way."

838 159 622 The most striking case is that of the chief Lᴇle'ks. As an adolescent he wore women's dress and performed the appropriate tasks. One day after returning from the lily seed harvest he lay down to sleep. They placed a bow and arrow and a punt pole by his side, the latter a symbol of women's work. They stood over him and shouted. As he jumped to his feet he grasped the bow, thus determining his future. He ran off to Mount Scott (t!u'msümᴇni), staying through the night on the mountain in quest of a supernatural experience. As he was returning he smelled the sweaty odor of running horses. He left off women's dress and actions from that time. He became lucky in every way, acquired wealth, especially in horses, and prestige, and became the foremost chief the Klamath have known. His

159
838
[622]

subsequent career seems quite normal unless exception be made of his seven wives!

A woman named Co'pak lived like a man although she retained women's dress. She married a woman who lived with her a long time and finally died. She observed the usual mourning, wearing a bark belt as a man does at this time to prevent the back from growing bowed. She tried to talk like a man and invariably referred to herself as one.

Another woman still living has had relations with both women and men. She never adopted men's garb but told them that she was a man. She is today a common prostitute, an abnormal, irascible person. Those she lived with were all older women, not young girls. This practice is known as sawa'linãa, to live as partners. They say of such: they have lots of partners, friends (anewã'ëts doma' sawa' linãa'sgitkt). Other Klamath of any standing have always avoided her and her women partners. She was never married to a man.

HOUSE GROUPS

342
592

It is now difficult to get evidence on household composition. Houses vary in size, to judge by the existing pits, from twelve feet in diameter to as much as thirty-five feet. The larger houses must have held a number of families and as many as ten or twelve persons. One described below had five families, numbering twenty.

The majority of the inmates of a house can usually trace some relationship. This is also true of most of the inhabitants of a settlement. For example, the village mo'giŋkünks had half a dozen earth-lodges, of which three held the families of two brothers and their father's male cousin. Residence is normally patrilocal. In the cases which follow the connecting relatives are for the most part related in the first degree. [591]

An earth-lodge on the lower Williamson river built about 1870, and measuring thirty feet in diameter, contained five men, their wives and children, whose respective portions of the house are shown in figure 4. This was known as the home of the shaman Boke's; the others were related to his wife.

1. Boke's, wife, and two children.
2. Lek!o'c; wife and two children.
3. Wokau'k!alis, a widower, whose two wives had been Molala sisters.[76]

---

[76] Their Molala names were Sjowa' and A'li'ak.

do keep up their ordinary occupation in part during this time. They 841 dig roots for instance, but others must care for the products further, else the women will never find any more.

There is no comparable rite for boys at puberty. Nevertheless the 881 time when a boy's voice deepens is recognized as propitious for seeking power. He is sent into the mountains for perhaps five days, to wander [787] at night, running continually, piling up rocks, swimming in the mountain pools and eddies of the rivers, fasting the while until a song comes to him in a dream. He must use a head-scratcher. Preadolescent boys [866] are tossed into the river or whipped while they sleep. If the boy whimpers he will be a weakling; he is expected to jump up and shout, I have cited above the case of Lɛle'ks who was so treated at puberty, it seems, and thus lost his transvestite habits.

When I [Pat Kane] was a little boy of seven or ten, my father sometimes 866 threw me into the river while I slept. I did not ask why. Finally he told me, 159 "I do not want to kill you. I do it so that when you are grown you will not easily get sick, so that if you are shot you will recover quickly." I always bathed in the river as a boy and you see that I have never even had rheumatism until recently.

DEATH AND MOURNING

Klamath funereal observances are personal, non-ceremonial, and 764 somewhat unique in that they provide occasions for the seeking of power. There are no mourning anniversaries. [765]

Cremation is the universal practice, even for suicides, the newborn, and the stillborn. Only the bodies of secretly aborted infants are buried in the bush. The body of a man killed in war is brought [727] home for cremation.[86]

Some Klamath men were trapping in the mountains west of Crater lake about eighty years ago when they were met by some Upland Takelma who killed four or five. One boy alone escaped and made his way back to Klamath marsh at night. The Takelma took scalps, hands, and feet of the dead, and held a dance. Many Klamath went to fetch the bodies, which they brought to Klamath marsh for incineration.

Near each group of settlements is a spot where all cremations take place. It is somewhat apart from the settlements but not isolated.

Three of these serve the Klamath marsh people; on the eastern side of the marsh near the towns k'ɛtaiwas (2, see maps, figs. 1-3), gūpgúa'kai (3), and l'wal (4). For others of this division of the tribe, there is one on Sprague

---

[86] Cremation was given up forty or more years ago ("in about 1868," Gatschet, 1:86). The first burial was that of a Molala man, married to a Klamath woman, who was killed by a Klamath. [177] [178]

756

[622] The shaman himself is, or was, the outstanding figure of Klamath society. [177] He had no rival in the chiefs, the rich man, until the coming of the whites brought a redistribution of emphasis in Klamath life. Chiefs had previously been persons of little influence.

771 *171 All this is familiar enough among Indians; the Klamath differ only in particulars. In its several aspects, their religion, as well as its practice, is one with that of the Great Basin, Plateau, and Mackenzie tribes.

THE POWER QUEST

787 The quest for supernatural aid is open to everyone, men and women, boys and girls. It is a constantly recurring feature of their lives. Everyone, perhaps without exception, seeks the powers at least once during his lifetime and further experiences seem to be repeatedly sought.

[881] The first occasion is always puberty. I doubt that boys and girls are expected to be uniformly successful in securing aid at this time, because, it was said, at shamanistic performances those who had power might sing their songs. This may imply that the others either never [765] acquired power or had lost it. My informants' frequent emphasis on the period of mourning for a husband, wife, or child marks this, too, as a peculiarly pregnant period when power may be successfully sought. At least at such a time a man loses his power and must seek [844] again if he wishes to regain it. A man also seeks power at the birth of a first child. But it is not only the crises of life that provide [756] occasion; the quest may be undertaken at any time, and it is the practice of such as gamblers and shamans to renew and enhance their [525] powers by frequent attempts. The quest is called spŭ'tu.

The experience does not ordinarily include a vision, but is made manifest in a song heard in a dream. In some instances where a vision is had, a dream song follows, but it is clear that the latter is the essential experience. In the following case a man and a woman had identical visions but to the man alone fell the experience leading to power.

787 • 159 The grandfather of a Klamath Falls shaman went to stŏ'kmōte, the point of Eagle Ridge, in the evening. There is a spot in the lake where bubbles rise. Horses lived in this long ago (!). When this man reached the headland he saw two pinto horses, with long manes, rearing against each other from the water. He was not frightened but took off his clothes and plunged into the water in order to secure power. When he recovered consciousness he found himself again on land. From that time he was lucky; he began to get many pintos, large horses. Because of this experience his grandson, the shaman, also acquired, in his turn, spirit songs of all kinds.

An old woman, gathering wood at this place, also saw two horses in the water. Turning to her husband she said, "There are horses standing over there," but when they looked again, the horses had disappeared. Such a disappearance (tᴇke'tḳa) is a sign that a relative will die; one of her relatives died after this. 787 [159]

Visions evidently follow one of two formulae. Either, as above, the spirit appears standing in the water and then disappears, or it drags the swimmer below the water for the purpose of devouring him, as instanced below.

One word swi'ls means song and spirit being. A certain dualism is involved here. Spirits are definite beings that dwell in the mountains and in the water. On the other hand all songs are called swi'ls, including those for amusement and non-shamanistic dancing, which bear no reference to spirits. That is, spirits and songs are certainly recognized as separate entities. Nevertheless, when it is said that a man has a Coyote swi'ls, for example, it means that he has the appropriate song or songs and that this animal is his supernatural helper. The spirit never manifests itself but in the song; the singer is the vehicle, the voice of the spirit. Song and spirit are one and the same thing. 787 776 533

Power is sought in lonely spots on the mountains, in mountain pools, in eddies in the rivers, in all places where spirits are known to dwell. A boy is sent into the mountains on a vigil of several days, perhaps five, at puberty, that is, when his voice changes. He seeks power that he may acquire property, be a good hunter, become rich, a chief, and be able to do all the things that are difficult. (One does not need power to be a fisherman, for instance.) He must fast and must not touch his hands to his face, but must use a scratcher instead. He must sleep without covering and warm himself only occasionally by a little fire. He runs about constantly throughout the night, piling rocks into high piles[147] (called sᴇwa'l) and swimming in the mountain pools. He prays, calling loudly to the spirits, and finally gets an answer. At night he may see a spirit with blood flowing from his mouth; then he faints and when he wakes he too will have a hemorrhage (djăkglĕkgĕ'ḳa). He "nearly dies" before he secures the song. 787 881

It is possible that girls also seek power at puberty. Their dance at this time takes place at night; during the day they sleep in the brush or on the near-by hills. Then a song may be dreamed. One [562] informant had it that they spend the night piling rocks like boys, returning at daylight, but I consider it very unlikely that a girl

---

[147] Clarke, Rock Piles, 40, refers to the many piles of four or five boulders placed on one another which occur in this country.

787 would be allowed to go unattended. Women well along in years, how-
881 ever, follow the regular practice, at least as to bathing in the spirit
562 places.

787 The same method is pursued by the mourner, gambler, or shaman who seeks power, but swimming in the deep river eddies was more
756 frequently mentioned in this connection. These seekers are almost
525 always men, but older strong-willed women will attempt it. Power may be sought at any time during the year, but they do not dive for it until the first willow buds appear (in the seventh month, March or April). I presume that deep snows and ice in the mountains preclude earlier attempts.

787 During the day the seeker sweats and fasts, waiting in the brush until nightfall. He then goes to the river and dives to the bottom in search of the spirit. He must not be frightened even if he sees some-
[756] thing moving under the water. He prays before diving, "I want to be a shaman. Give me power. Catch me. I need the power." Sometimes he comes up unconscious, blood streaming from his mouth and nose. He must wait until the flow stops before going home.[148] This night he hears nothing because he has been frightened by the spirit, nor will he eat the following day for fear of falling ill. On the following night or soon after, he hears the song of the spirit as it sings beneath the water. He may dream of hunting deer, acquiring horses, of success in gambling or with women, and of marriage. One informant dreamed of being in an earth-lodge. When he wakes the
[539] seeker sings about the subject of his dream. One song dreamed by an old woman is

e′ha e′ha e′ha e′ha e′ha
(repeated four times)
noai′meso spu′ŋgötgŏple′ spŭ′ŋgötgŏple′
I am the one pursuing you.

It seems that, like a boy at puberty, this seeker, after swimming, may go to the mountains to fast and pile rocks. He may remain there for some time, but one exceptionally rapid quest was cited. Nancy's father having lost a child, he went swimming in Crater lake; before evening he had become a shaman.

787 A power quest under unusual circumstances is that of Lɛle′ks. This man, the most prominent and successful chief of the last century,
• 159 was a berdache in his youth. His people wanted him to give up woman's garb. One day when he lay asleep they placed a woman's

---

[148] Gatschet also describes this (*op. cit.*, 1:82–84).

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

canoe pole and a bow and arrows beside him. Shouting suddenly, they woke him and as he leaped up he seized the bow, thus determining his future life. Running off to Mount Scott he spent the night there. As he was returning he smelled the sweaty odor of running horses. In later life he was lucky in everything; much wealth, especially horses, came to him. 787 159

Dreams of the same sort came to men or to old women without being deliberately sought. Should a man have several such visions, he may decide to become a shaman, whereupon he undertakes the customary fire dance of the novice. But if he chooses to ignore them, the power and the opportunity slip away. 787

Last night I [Pat] dreamed a song: I am nearly a shaman. Yesterday I tried to catch fish but it rained too hard. I then went to town but I could not get what I wanted. So I returned home, ate, and lay down. I dreamed that my horses fell in the mire when I drove near the mountain. I wanted to save them but I could not raise them. I heard a woman's song behind me. [539]

dje′udjĭs	snaĭwăs
feathers all over	woman
Helen	sna′wăs
[his daughter's name]	woman

The fish did not like me; they did not let me catch any. They made the bad dream. This is the same way as a shaman dreams.

Another dream, though not of this type, may be inserted here.

Last night I (Coley) dreamed I was chased by a big, black man; not a Negro, just hard to distinguish. He had nearly caught me when I woke and heard the chickens squawking.

There is only a slight tendency to the inheritance of the shaman's art. The case cited above where a shaman received spirit songs because his grandfather had an experience is hardly to the point, since these experiences are so common that every shaman must have had a close relative who obtained power. But my informant's statement that when a powerful shaman dies his child may become a shaman is borne out by her own case. His spirits and his clairvoyant powers (dode′ŭks, dreaming) are released by his death and must go to some-one else. If his relatives keep his pipe or other paraphernalia about, it is certain that his spirits will come to one of them. 756

Nancy's father, who died before she was born, was a shaman. When she was quite small and could first understand, she began to dream of Frog, a big woman spirit. Sometimes she would jump up at night and run, afraid of the dream. The spirits persisted in trying to make her accept until she was grown; finally she heard their voices whispering close behind her. She was about twenty and had several children at the time. Her relatives did not want her to become a shaman. 159 756 787

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

159 756 787 Her older sister (i.e., mother's sister's daughter) gave her medicine so that the spirits would no longer bother her. Two of Nancy's children became sick. A shaman, Alec Wilson, diagnosed their case as due to Nancy's refusal to answer the spirits, to begin the shamanistic performance. Another shaman was called in to relieve her of the spirits. He did it very quickly; he had three or four spirits to lead each of Nancy's "to their side." He used the songs of these spirits immediately, for they were now his. These two spirits were Thunder (lɛme'is) and Falcon (ɛndo'gis). Had Nancy wanted to become a shaman she would have called the people together in order to demonstrate to them in a fire dance.

778 A partial list of spirit places (spŭ'tuks) in Klamath territory is gleaned from my notes. As I made little inquiry about the southern and eastern parts of their country, it happens that most of these lie in the north. They are about equally divided between localities in the Cascade mountains and deep eddies of Williamson river. Undoubtedly some of the rocks described as transformed people, animals, etc., are thought of as places where spirits reside, but as I was not told that power was sought there I have not included them in this list.

Ge'wŭs, Crater lake. People were stolen and taken down into Crater lake by beings there. Some say they have found no water in the lake. Instead there were rocks as big as trees and deep tunnels in the bottom. There are animals, snakes, and a sort of people who live at (or in) the ocean. Men swim in the lake at night to get spirit aid.

778 787 A second site is ma'kwalḳs, a point of rock projecting over Crater lake from the western cliff. The seeker clambers down and piles rocks on the point.

On the northwestern side of Ghost's Nest mountain, which lies southwest from Crater lake, is a saucer-shaped bed of rocks overlooking the whole countryside. Lads built their fires near-by and lie in this in order to see a spirit. On the eastern side of the mountain are piles of four or five large rocks, erected by seekers.

Ho'tkakönks, Mare's Egg spring, is six miles north of Cherry creek on the western side of Agency Lake marsh. They swim here at night. Once men found no water in this pool but a big man, with hair covering his body, standing in it. When they returned he had disappeared and the pool again held water.

Pau'usnĕḳŭs, Harriman (?) mountain southeast of Mount Pitt. The Klamath say this is higher than Mount Pitt; indeed, being nearer, it appears higher. Two accounts pertaining to this mountain may refer to the same incident.

Long ago a Klamath climbed it, but he never returned, for he died of the cold wind although it was summer.

A Pelican bay man, who died long ago, once went to a lake on this mountain at sundown to seek power by swimming. He saw men in it, the backs of some,

> 175 648 [797] told him about the Holy Spirit that was to come to the whole world and visit its remotest parts. When he came back from the Dalles he told his people about it but found them groping in perfect darkness. . . . They would not believe him and told him he lied. He had watched long for the coming of the Holy Spirit and had never doubted that he should see him. He had heard Mr. Meacham talk for many days. . [and] now he saw that he was not like other men and knew that he must be the Holy Spirit come at last to bring gracious gifts for all tribes. . . ."[16]

175 177 648 622 Others—and they were to become more influential—lived for some time with whites and became convinced that the best policy for the Klamath was one of peace. They included Lileks, who in the course of the trading excursions to the north dwelled for several years at The Dalles and was exposed there, no doubt, to the examples of authority set by whites as well as by the Columbia River tribes themselves. Another was Dave Hill, who, starting about 1859, lived approximately five years in Oregon City. Allen David, later to succeed Lileks as head chief in reservation days, was "well versed in the ways of the white man, from travel among the Willamette settlement." Another was Charley Preston who, like Hill, had spent five years at Oregon City, working for white farmers and had become "quite civilized and learned many of the white man's ways. He returned to his tribe and became a headman. . . ."[17]

175 159 622 [595] Men such as these became the leaders of a "peace party" among the Klamath, and their views achieved dominance in the growing centralization of power among the Klamath. Lileks may have consolidated the ascendancy he presently achieved as head of this group by marriages beyond his tribelet: to the four wives from his own, Klamath Marsh, division, he added one each from the Lower Williamson and Klamath Falls groups, as well as one from the Modoc. [177] [681] From the Columbia he or a contemporary brought back new "laws," which included the institution of flogging as punishment for murder or for persistent quarreling. In one instance, ascribed by Spier, with some question, to pre-reservation days, when two men of the Lower Williamson River tribelet slew a Klamath Falls man, Lileks had them haled to Klamath Marsh, where each was beaten five times.[18]

175 648 When, in 1858, it was indicated that Klamath and Rogue

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

No sooner had the party of nine pupils finally gotten under 648*
way than Applegate received a letter from the Commissioner 657*
calling attention to a letter sent him, apparently by Jesse Kirk 871
himself. In it, the writer accused Police Captain Joseph Kirk, a part-Modoc, and Judge Jack Palmer, a Lower End Klamath, of using their influence against sending children to nonreservation schools. "There are two parties here," wrote Applegate, "who [865]
oppose each other on nearly all propositions, the two leaders of which are Captain Joseph Kirk and Rev. Jesse Kirk, half brothers, and who are among our most advanced and able men." He promised to refer the matter to Gen. A. C. Hawley, a Special Agent then visiting Klamath.[15]

Ironically, Jesse Kirk's stand was soon reversed. Soon after he had deposited his sons at Carlisle, the elder boy, Clayton, in company with another pupil, Joseph Ball, ran away and was only recaptured in Pittsburgh. In Applegate's view, Joe Ball, an interbreed and a product of the public school in Klamath Falls, was the ringleader of the escapade and had led his more impressionable companion astray.[16] The senior Kirk thereupon sought to have both sons returned, and Applegate tried to put him off.[17] To Major Pratt at Carlisle he wrote ruefully:

> . . . I have been reconsidering the idea of sending you a class and even regret that I did send the class of nine, as things have turned out. It is hard to get pure bloods to go, and the pressure to get away from the reservation to our non-reservation schools is almost invariably from the mixed element. The Klamaths and Modocs are a determined lot and Rev. Jesse Kirk, son of a resolute old warchief, is no exception to the rule. A short time ago the principal champion of Carlisle he is now ready to move Heaven and Earth to secure the return of his boys since Clayton's escapade, and I wish they were all back.[18]

This action brought into confrontation an embattled Agent 648*
and the defiant leaders of the reservation. In Jesse Kirk the 657*
Indians has as leader a product of those very "civilizing" forces 622
upon which the government had rested sanguine hopes. The son 159 •
and namesake of one of the treaty signatories, we have encountered him previously as schoolboy and carpenter's apprentice, as interpreter and as ordained Methodist preacher. In 1886 a representative of the Indian Rights Association characterized him as "a superior man, in poor health and great poverty, . . .

[Klamath Reservation]

*648 *657 622 • 159 working without salary or assistance of any kind, for the moral and religious improvement of his people. He has a great thirst for knowledge, but has no books, not even a Bible, only some torn fragments of an old one."[19] From Nickerson's time on he had served as judge in the Court of Indian Offenses, while he had likewise been in the forefront of several actions earlier detailed. Thus, in 1896 he was one of five men advocating that money received for pasture be distributed equally among tribal members and that the price for grazing be raised.[20]

Applegate, who had long known him, had gone out of his way to endorse Kirk's financial credit. That he tended to be somewhat slow in paying his debts is more than suggested by a partisan letter written late in the clash by one of Applegate's friends, formerly a trader at the Agency.[21] There is little question that the attention Kirk received magnified his own opinion of his status. In Washington, he gave as his title, "Delegate and Representative Agent of the Klamath Indians of Oregon," suggestive of the equality with the U.S. Indian Agent toward which he aspired. Indeed, ambition of this character, blunted by an administrative surrogacy, was one of the unacknowledged ingredients of the new spirit abroad on the reservation.

*648 *657 571 159 On the Upper End, Henry Jackson, at the summit of his power, chafed under restraint. A former employer recalled him in the time of his power,

> . . . riding day after day like a feudal lord accompanied by his buskined and bespurred henchmen, often white men among them, looking after his cattle on a thousand hills. Henry Jackson is generous and hospitable. No weary traveller is turned away from his mansion, no matter what his race may be, and of the many Indians who appeal to him for financial aid, few are refused. Especially are the people of his home tribe welcomed to his bounty, and when any of them come to Klamath from the Moatwas land on Pit River, his house is their home. He has been known to go to Bonanza, the nearest white Trading Post, and make his neighbors happy by calling for their accounts, amounting to hundreds of dollars, and settling them in full.[22]

Knott C. Egbert, superintendent of the Yainax school and the administrator in charge of the Upper End, saw Henry Jackson somewhat differently. Upon the pages of his reports the "feudal lord" appears as a man defiant of authority and addicted to drink.

His son, Ralph, is depicted as a ne'er-do-well, a ruffian, and a 648*
drunkard. (He later died while awaiting trial for cattle theft.) 657*
His indulgent father, it was said, was convinced that Ralph had 571
a weak heart, and would pay his fine rather than see him in jail. 159
There are manifest in Henry Jackson as in Jesse Kirk some of the same values evinced by the early Klamath: kin-loyalty honored above abstract ethical mandates, merit gauged by generosity, and the dissimulation of hostility are three among them.

As Egbert saw it, "The Jackson outfit are so used to lawlessness and successful concealment afterward that they have gotten to thinking that they have a right to almost anything and then hire witnesses to lie them out of the scrapes. Then too they are all afraid of the czar, Ralph." Alluding to the murder of the Modoc shaman which Henry Jackson had been suspected of instigating, he added, "I will also be afraid of him if they are allowed to go on till they think they can duplicate the killing of Dr. George in the Caucasian race."[23]

The Jacksons in turn were linked to Jeff Riddle, whose daughter Ralph had married. There were, indeed, limits beyond which Riddle would not go. His father had known Applegate well from Modoc War days on, and when stranded on the lyceum tour had relied upon Applegate's generosity for funds. Even after Applegate had resigned his position, Riddle continued to correspond intimately with him.[24] When Ralph beat his wife, Jeff Riddle preferred charges against him.[25] These circumstances aside, Jeff Riddle exemplifies one of the less-partisan leaders who stood somewhat aside from attacks on Applegate but was nonetheless restive under administrative restraint. Later the author of *The Indian History of the Modoc War* (1914), he was first and
foremost a patriot of his people. With others, he focused his bit- 648*
terness against the Indian police, who as "Agency men" consti- 657*
tuted the immediate embodiment of administrative sanctions. 625
Such critics were quick to ferret out and to report derelictions [159]
on the part of the police lieutenant[26] and to oppose other members of the force. Of one such man, Egbert wrote:

> Jeff and others are bitter against Ike Mose as policeman mainly because, I think, he will arrest one of the big men as quickly as one of the smaller prize, so called. Jeff has made his brag that Ike will not be on the force July 4th. For this reason, as well

*648 anticipation of rebuff. It may have as its corollary a diffuse self-
*657 image, since the subject lacks any consistent delineation of his
156 characteristics from the reactions of his fellows. For some, as
177 well, there is a sense that a stable reference to self through time
178 is lacking, since each fresh experience tends to define it anew.
For the majority of tribal members observed over a period of time, enduring reference groups in which one could claim membership were limited to such entities as "Klamath Indian." As Clifton has put it:

> Persons as psychologically isolated as the Klamath must work hard at the business of maintaining their position. They cannot be expected to contribute much in the way of specific demands on others (outside of occasional impulsive outbursts), and they value situations where specific demands are not made on them. We seem to be confronted with a human group whose members share a primary orientation toward living which is organized around the need to be left alone to their own devices as individuals.[39]

Permissive diversity has found an expression in the manner in which individuals have fused life-ways out of historically disparate elements. This was particularly striking among the older Klamath, who in their youth had participated actively in traditional Klamath culture. Some, indeed, pointed to the essential similarity of native ethic and of Christianity; but others found no need to justify their choice. Life for them possessed a meaning that was involved less in the cultural source of its elements than in the condition of their combination.

*648 One old friend, then bedridden and since deceased, may serve
*657 to illustrate the point. As a child she had lived in an earth-lodge
• 159 and witnessed her uncle, the shaman, Alec Wilson, performing
177 his cures. Later, as a young woman, she became ill when dream-
178 ing of a shaman, and recovered only when he had been forced to
156 treat her. The gathering of traditional foods and the weaving of
baskets had been part of her skills. A sweat lodge stood outside her cabin. She spoke Klamath and knew the native myths and songs.

Yet equally, she was a product of the Agency school and had worked at the military post of Fort Klamath. When she married, she wed her husband at the Methodist Mission. Together, they ranched together on Klamath Marsh, and with her daughter and

grandchildren, she was a familiar figure in boomtown Chiloquin. Cured by the Shakers, she almost joined the church, then changed her mind. From her bed, she discussed a life-way that was an indissoluble blend of diverse elements integrated by their personal import. When she narrated or discussed a Klamath myth, her assimilation of a Christian ethic was evident in the delicate manner in which she skirted obscene passages. In admonishing her great-grandson, she spoke in the traditional manner, but in English, the only tongue they shared. The English she spoke, like that of her boarding-school contemporaries, was likewise syncretic; for it bore the impress of Klamath sound patterns and grammatical categorization. 648* 657* 159 178 177 156 [191]

Individuals such as she, often happy to escape from the gray reality of age into nostalgic memory, initially struck the observer as conservative when contrasted with the young people: the boys in Levis, cowboy boots, and leather jackets, the girls in jeans and plaid shirts, who spoke little or no Klamath, and who loitered in the cafes of Chiloquin hanging on the heavy beat of the jukebox. Yet at most, such folk were old-fashioned, and still retained the tastes and inclinations of long habit. Their commitment was selective. Those who still liked to dig the roots known as ipos did so, not with an aboriginal digging stick, but with the more durable iron counterpart made years ago by the Agency blacksmith; and they traveled to and from the grounds, not on horseback, but in the most modern of automobiles. 648* 657* 156 177 178

If there were tribal members who wanted to have as little as possible to do with whites, they did not thereupon stop speaking English or give up their houses, cars, and radios to accomplish this. They continued to purchase food and other necessary items from white merchants. Indeed, their hostility might find short shrift from another Klamath who commanded more knowledge of the traditional lore and still recounted the old myths to her grandchildren, yet possessed many friends among the whites.

Clearly, there was at Klamath in the latter days of the reservation no clearly distinguishable category of the "native-oriented," in the sense of a preferential adherence to the institutions of native life. Deliberate retentions rather served as the diacritics marking an ethnic nationality.[20] The use of the Klamath language to signify an Indian estate was one marker. It might be used on 648* 657* 177 178 [191]

[Klamath Reservation]

*648 Pacific Coast, tribal members lived in urban centers as well: in
*657 the cities of the Willamette Valley, in Portland, where about a hundred dwelled, in Seattle to the north and Sacramento and San Francisco to the south. Beyond this area and eastward to the Atlantic Coast the number dropped sharply, although there were tribal members as far distant as Massachusetts. Only a handful of the absentee members lived on other reservations.[3]
[619] Tribal families residing in the same city demonstrated little tendency to form a compact ethnic enclave.

*648 Within the reservation, tribal members in the Lower End
*657 communities of Chiloquin, Modoc Point, and Klamath Agency
489 were almost half again as numerous as those in the Upper End
[491] towns of Sprague River and Beatty.[4] (See map of Klamath Indian Reservation.) Travel between the Lower End and Klamath Falls, the largest city in the county and its administrative seat, was relatively easy by comparison with the Upper End, and the advantage remained even after a market road was constructed linking the latter directly with the county seat. As a result, Beatty and Sprague River long had closer ties with such towns on the eastern periphery as Bly, Bonanza, and Lakeview, far smaller communities than Klamath Falls, and correspondingly less complex from an institutional standpoint.

*648 During the first years of the termination program, between
*657 the publication of the provisional and final rolls of the Tribe, the
• 16 change of address of tribal members reflected the migration currents. Within the reservation, movement ran from smaller to larger communities. Between the reservation and the outer world, the records show almost three times as many Klamath departing as returning. Those leaving the reservation were drawn to cities, rather than the rural countryside or the smaller towns. Although the rate of movement had accelerated in those days, the trends hold true for the entire postallotment period.

A survey of the motives which at an earlier time had brought Klamath to Chiloquin and to Klamath Falls shows that consumer values ranked high. A few had come to seek jobs, particularly to the county seat, for the narrow range of opportunities on the reservation offered little choice. Others left the reservation to escape what they regarded as the stultification of reservation life or the demands upon the ambitious made by the claims of kins-

648* 657* 16

men. The major attractions, however, were the stores, the schools, the movies, the excitement, and the entertainment. These advantages seem likewise to have favored the shift to larger communities.

Thus, over an extended period of time, there has been a substantial and growing body of Klamath who, while retaining an equity in the tribal estate and membership in the tribal body, have come to dwell away from the reservation and who visit it infrequently, if at all. Their daily life is spent within a milieu, and in reliance upon a "personal community"—to use Jules Henry's expressive term[5]—made up largely of non-Klamath.

648* 657* 144

The heterogeneity of the Klamath is also reflected by their biological composition. While the characterization of the degree of Indian heritage, expressed as a "blood quantum," is open to occasional error in individual instances, the figures taken in summation reveal significant differences. By 1955, only twenty-eight per cent of the absentee members could claim to be biologically of over one-half Indian ancestry, and even for those dwelling upon the reservation the corresponding figure was no more than fifty-four per cent. Within the reservation, in turn, Lower End Klamath were markedly less Indian by this measure, falling between the values for absentee and Upper End members.[6]

648* 657* 162

Like many other Indian groups, the Klamath population possesses a large segment of younger members, marking an increase over the early decades of the present century. In the days of termination, those under twenty years of age comprised no fewer than forty-seven per cent of the total tribal membership, a figure exceeding that for the general population of the United States, of which only one-third fell within the corresponding bracket.[7] Although these figures are often interpreted as reflecting improved health conditions on the reservation, they also reflect an increased rate of marriage with non-Indians. [563]

648* 657* 184 361

The variety of Klamath life during the latter days of their tribal existence may be illustrated by data from the Upper End community of Beatty, the Lower End city of Chiloquin, and from the off-reservation communities of Klamath Falls and Eugene-Springfield in the Willamette Valley.

Beatty and Chiloquin represent special facets of reservation

The Klamath numbered 3000 in the historic period, the Modoc not so many. This is the testimony of Tom Lang, yet the number is much too large. Palmer[18] put their number at 415 in thirteen villages in 1854, but his list of villages indicates that he counted only the ä'ukckni (Klamath marsh) division. This would be about eighty-three families, a reasonable average of six houses to a settlement. At the time, however, the Klamath were said to be considerably reduced, and I was told of twenty-nine or more ä'ukckni settlements dating from this period, and said to be all occupied at the time. Yet, as no great epidemic was reported, it is doubtful that the population had been diminished by half. Possibly the occupation of the sites was more seasonal than I was told: a movement to Klamath marsh in summer, returning to the warmer Williamson valley in winter. Assuming a partial reduction and some fluctuating occupation, we may arbitrarily set the ä'ukckni at half as many again, say 600. The ä'ukckni settlements numbered half of the total and my informants' impression was that in population they were as many as all the other divisions together. This would mean that the Klamath as a whole numbered only 1200. Palmer's figure would give a mere 800, and the evidence of the settlements, a possible 2000. Our twelve hundred is not far from that of Kroeber, who set the combined Klamath and Modoc population at 2000, two-thirds of them being Klamath.[19] Mooney's estimate of 800 seems low.[20] 174 161 •

Early Contacts with the Whites

Contacts with the whites date back to 1825 or somewhat earlier. In 1826–27 Peter Ogden spent two months among the Klamath.[21] His first meeting with them seems to have been on Klamath marsh. 175

> Wednesday, 30th Nov. [1826]. Course south to Clammitt River [Klamath marsh?] 25 miles from River of the Falls [Deschutes]. Mr. McKay proceeded ahead to an Indian village distant 3 miles. It was composed of 20 tents built on the water approachable only by canoes, the tents built of large logs shaped like block houses the foundation stone or gravel made solid by piles sunk 6 ft. deep. Their tents are constantly guarded. They regretted we had opened a communication from the mountains. They said "The Nez Percés have made different attempts to reach our village but could not succeed. Even last summer we discovered a war party of Cayuse and Nez Percés in search of us; but they did not find us. Now they will have yr. road to follow. We have no fire arms. Still we fear them not. [131] [361] [342] [721]

(ca. 1860-1900) NR10 Klamath NR10

[141] They are well provided with bows and arrows. They have only one horse.
Snow is so deep, horses perish for want of food. In winter, they live on roots.
[231] In summer on antelope and fish.

December 1st. 30 Clammite Indians paid us a visit: fine men in good condition, but wretchedly clad. They say the river to the ocean is far distant and beaver they do not know. They say the Indians become more numerous as we advance to the ocean. . . . .

[342] Tuesday 6th. Reached Indian village of five huts, but large size square
made of earth flat on top the door at the top a defence against arrows but not
[161] balls. 200 of them collected about our camp and traded 4 days. The 2 chiefs
delivered traps lost by Mr. McDonald last year with 8 beaver. This is much in
[439] favor of their honesty. On our march this day, we passed the camps from wh.
Mr. McDonald turned back last year and are consequently strangers to the country in advance.

[161] Thursday 8th. About 300 Indians around our camp. We advanced 6 miles south following the river south. I estimate the Clammitte nation 250 men.

Monday 12th. Reached the lake [Klamath lake?] 1½ × 15 miles well wooded with maple and hazel; course S.

[361] The second visit on record is that of Frémont, who reached the northern shore of Klamath marsh on December 10, 1843. He saw smoke at what appeared to be the middle of the marsh and along the opposite shore. An unoccupied northern shore agrees with my own information. The following day he visited the village "in the middle of the lake (or savannah)," which appears to be one of those at the outlet of the marsh.

[342] The huts were grouped together on the bank of the [Klamath] river, which, from being spread out in a shallow marsh at the upper end of the lake, was collected here into a single stream. They were large round huts, perhaps 20 feet in diameter, with rounded tops, on which was the door by which they descended into the interior. Within, they were supported by posts and beams.

Almost like plants, these people seem to have adapted themselves to the soil,
and to growing on what the immediate locality afforded. Their only sub-
[226] sistence at this time appeared to be a small fish, great quantities of which, that
had been smoked and dried, were suspended on strings about the lodge. Heaps
[252] of straw were lying around; and their residence in the midst of grass and
rushes had taught them a peculiar skill in converting this material to useful
[285] purposes. Their shoes were made of straw or grass, which seemed well adapted
for a snowy country; and the women wore on their head a closely woven
[291] basket, which made a very good cap. Among other things, were parti-colored
mats about four feet square, which we purchased to lay on the snow under our
blankets, and to use for table cloths.

[231] Numbers of singular-looking dogs, resembling wolves, were sitting on the tops of the huts. . . . .

[648] They made us comprehend that they were at war with the people who lived to the southward and to the eastward; but I could obtain from them no certain information. . . . .

This morning the camp was thronged with Tlamath Indians from the southeastern shore of the lake. . . . .

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10
Modoc NS17

[Klamath Reservation]

and they tended to retain a greater concern with hunting, a condition M 133
which archeology tells us was characteristic of the early 226
Klamath, but which the latter came somewhat to relinquish with 224
their concentration upon the product of the waters. Likewise, 433
the Modoc seem to have placed a somewhat greater premium M
upon the gathering of wild seeds, in a typically Basin-California [222]
manner. Nonetheless, fishing was by no means neglected, and [361]
their villages lay principally about Lower Klamath, Tule, and Clear lakes, as well as upon Lost River which roughly parallels the Sprague in its westward course, until it bends south to empty its waters into Tule Lake.

Protected by relatively inhospitable land to the north, by K
broken hills to the east and south, and by the Cascades on the M
west, the Klamath-Modoc homeland fostered a culture somewhat 131
provincial in character, owing to its remoteness from major 101
centers of development, yet distinctive in style. Neither people occupied, for any distance, the Klamath River, which drains the Klamath Lakes and falls through its canyon to the Pacific; and neither seems to have been directly affected by the culture that emerged along its lower reaches among the Yurok, Karok, and Hupa.

Favored though they were by contrast to the Great Basin, the K
Klamath uplands did not support a large aboriginal population. M
The Klamath and Modoc together have variously been estimated 161
to have totaled between twelve hundred and two thousand, the Klamath having about double the numbers of their southern kinsmen. Population densities provide a further perspective. Those for the Shasta immediately to the southwest and for the Oregon Coast were roughly ten times as great as that of the Klamath-Modoc. The Kalapuya of the Willamette Valley and the Takelma of the Upper Rogue furnished figures about twice as great, and the Achomawi and Atsugewi of the Pit River drainage south of the Modoc had densities four times the value for our tribes. Within the Plateau, the Sahaptin-speaking peoples of the middle Columbia and the Blue Mountains approximated their figure. In the Great Basin and the Southern Plateau, the Shoshonean Bannock, Northern Paiute, and Shoshone provided figures only one quarter as great. If the figure is taken to reflect the intensity of land use, the Klamath Basin was on a par with the

7

Modoc NS17

[Klamath Reservation]

K
M middle Columbia, far below the Coast and California, and in turn
• 161 considerably above the Great Basin.[6]

000 The mind's eye, drawing upon descriptions of early explorers and modern ethnographers,[7] can recreate the life of the early nineteenth century. It is a life that moves through a succession of activities with the seasons, each characterized by a community of different size and constituency. On a miniscule scale they resemble the "task groupings" which Anastasio has analysed in the intertribal relations on the Plateau.[8]

K During the long winters, existence is centered in the permanent
M settlements, for the altitude of the Klamath Basin is over four
221 thousand feet and snow often drifts deep. An accrued depth of
132 six to eight feet is common; while in the exceptional winter of
133 1890-91 a figure of thirty feet, undoubtedly in drifts, was recorded
361 at the head of Agency Lake. Crude, circular bearpaw snowshoes
481 provide a poor means of winter travel, and the settlements tend
262 to become isolated; most people are forced to remain in the villages, supplementing the meager winter catch with stores of dried fish and meat, roots, seeds, and berries.

K From a distance, the winter settlement has the appearance of
M hillocks strung out along the bank or clustered in a sheltered
221 spot. In size it may range from several score houses—there are
361 perhaps a hundred house pits at one favored site on Klamath
342 Marsh, though not all may have been occupied at the same time —down to tiny hamlets of one or two earth lodges and a few mat huts.[9] Within the village, the earth lodges are the dominant struc-
K tures, with the domed huts flanking them. In Klamath settlements,
M communal storage pits shelter the bulk of supplies; but the
343 Modoc prefer to conceal foodstuffs in household caches some
251 distance from the houses.

One Klamath woman recalled her childhood hamlet, part of
K a settlement totaling roughly two dozen houses,[10] on the lower
361 reaches of the Williamson River. Here she and her parents lived
342 with her maternal uncle, the shaman later known as Alex Wilson, whose earth lodge was the largest in the hamlet. Nearby was another lodge, the residence of Hunter Wilson, brother of Alex and headman of the family group. Some four or five mat-covered
K lodges and huts stood in the vicinity, the larger ones closer to
[343] the water for cooking and the sewing of tule mats, the smaller

TEN

[P.125]

The Changing Environs

THE ISOLATION OF THE RESERVATION HAD NEVER BEEN MORE THAN A 657* relative condition. From early days the soldiers at Fort Klamath, 648* the settlers on Wood River and the Upper Sprague, together [361] with the growing towns of Linkville and Lakeview, made its [166] seclusion far less than absolute. A policy that permitted the [464] freighting runs to Jacksonville and Ashland or the pass system by which perhaps three-fourths of the men and their families were permitted to leave the reservation for as long as four months to work for whites: these greatly diminished the policy controls exercised by the Agent.

In the period ahead, however, boundaries were to be further [161] dissolved. In 1882 Nickerson could declare, "This reservation contains as many inhabitants to the square mile as Lake County or Eastern Oregon."[2] Homesteaders were even then filling up the land, and the rate accelerated as Linkville—become Klamath Falls—and Lakeview responded to the market and communication needs of the region. When the Southern Pacific railroad reached Klamath Falls in 1909, the resource relationships in the Klamath Basin changed radically. Reservation timber, previously [313] of little commercial value, suddenly possessed great worth and the mills in Klamath Falls and neighboring communities soon became reliant upon it. The Oregon, Central, and Eastern railroad ran up the Sprague River Valley, while by 1911 the Southern Pacific had pushed north across the western face of the reservation to Kirk. In 1923 work was resumed on the latter line to complete the Natron Cutoff from the Willamette Valley; three years later it was completed. Thereafter, the Lower End lay on a main line.

Thus, to the cattlemen and sheepmen operating on the reser- [563] vation under grazing leases were added railway gangs, then

3:Stern E-4,5 (1949-1957) 1965 NR 10 Klamath NR 10

[Klamath Reservation]

*657 logging camps and mill towns. In 1930, at a time when the total
*648 enrollment of the tribe was some 1,250 persons, the predomi-
[563] nantly non-Indian population of one such reservation town,
• [161] Chiloquin, and its environs was roughly 1,850, a figure which
placed it second in size in the entire county. Indian-white relationships in such communities could no longer be adequately
regulated by the Agent. Moreover, improved means of communi-
[484] cation made it possible for an Indian to travel off the reservation
at will and thus beyond the reach of Agency authority. Most
[434] important of all, income from grazing leases, claims against the
government, and land and timber sales gave him the equality
of the marketplace.

*648 The maintenance of boundaries was justified in official corre-
*657 spondence of the eighties by the fate of those Indians who went
166 off the reservation. "Quite a number of the Indians," wrote
423 Emery, "obtain passes and go out to seek a living among the
whites. They usually camp in the suburbs of our little towns. With few exceptions these Indians become thriftless vagabonds. . . ."[3]

In 1884, Nickerson felt it necessary to counter the proposal of Judge W. S. Moore, of Linkville, that Sammy Andy, an Indian who had been working for Moore on pass, be allowed to locate permanently at Linkville and be released from the control of the U.S. Indian Agent.

> As there is no land that this man can secure as a homestead [he concluded], . . . [and] as I have no assurance that he has means sufficient to purchase a home suitable for his support, I do not approve of nor advise that the request be granted at present. Judge Moore has been very kind to this Indian, but should he die or move away, the Indian would be in a poor position to live, and would be subject to many serious temptations.[4]

The need for a general policy became apparent when several Modoc families who had never been on the reservation preempted homesteads in the Tule Basin. A reservation Indian, upon the advice of an attorney, likewise renounced his tribal relations and took up a homestead. "He has become deficient under his supposed citizenship," reported Nickerson, "and says he will not allow the Police to arrest him. . . . There is a white man

[Klamath Reservation]

*648 *657 619 641 Tribal membership was, as we have seen, only one of several political roles in which Klamath might participate, and in some measure it lay athwart the others. Citizenship in the United States, granted generally to American Indians in 1924, affiliation with state, county, and municipality: these political memberships are explicit in character, conditional upon the fulfillment of stated requirements and with the exercise of well-defined rights. Superficially, tribal membership appears to possess a similar character. In the admission of new members, both the establishment of qualifications and the decision upon individual candidates rested with the Tribe, though subject to review by the Bureau of Indian Affairs. Applicants had to be of Klamath parentage on at least one side, and those of one-quarter or more Klamath heritage were automatically admitted upon application. In 1945 a clause was added permitting adoption of members of one-sixteenth heritage, contingent upon assurances that they would reside upon the reservation and participate in tribal activities.

[161] [162] In practice, Indian heritage of any sort, and not merely that stemming from the Klamath Tribe, was reckoned in; and token assurances of participation and residence have conventionally been accepted. Of the final enrollment of 2,133 tribal members, 86 fell within the category of one-sixteenth quantum. Of these, 12 dwelt on the reservation and another 12 in Klamath Falls, the remaining 62 residing at some distance from the seat of tribal government. Once enrolled, members have not been subject to review, save when their original qualifications were called into question.

[602] [621] In a membership that was not conditional upon performance, the Tribe had a great deal in common with such ascriptive entities as the family and ramified kin, the traditional tribe, and the broad regional communities into which the latter had tended to cluster.

[602] Family loyalties have been at once strong and selective. At times, they have provided continuities of interest within a single line. Here, for example, were the Rev. Jesse Kirk, himself the son of a treaty signatory, and his sons, Clayton, Seldon, and Jesse Lee; here old chief Monchnkasgitk, and his sons, Harrison and Henry Brown; here Judge William Crawford, his wife, Eliza, and their son, Wade; here Henry Jackson, his half-brother, Ike, and the latter's son, Boyd Jackson.

000 For the recency of separation of the Modoc, see Gatschet (1890), Pt. 1, pp. 13, 14, n.13, 1.

5. See Sapir, reprinted in Mandelbaum (1951), pp. 169-78.

K M [114] [161] 6. Mooney (1928), p. 18, gives a value for the Klamath of 800 and for the Modoc, 400 persons. Kroeber (1925), p. 320, sets the combined figure at 2,000 and estimates that the Klamath have always numbered more than twice the Modoc population. Spier (1930), p. 5, reaches total figures in agreement with Kroeber. Kroeber (1939), pp. 136-38, reverts to Mooney's values in estimating tribal densities.

7. For the latter, chiefly Barrett (1910), Coville (1897, 1904), Curtin (1912), Curtis (1924), Dorsey (1901), Gatschet (1890), Kroeber (1925), Powers (1877), Ray (1963), and Spier (1930), the last two being the most important sources, respectively, for Modoc and Klamath.

8. Anastasio (1955). The changing societal constellations each directed toward a common task also resemble the "structural poses" described by Gearing (1962), for the eighteenth-century Cherokee, with the difference that the social groups entering into the constellations among the Klamath and Modoc are, by comparison, far more diffuse and less well defined.

9. Spier (1930), p. 13, site 6.

10. See Spier (1930), p. 15, site 23. The settlement size follows Spier.

11. As the Klamath pungently express it, "They even divide up a flea." Barker (1963), pp. 162-63.

K [648] [625] 12. An Agent once requested waiver of the stipulation that Indian police must stand five feet eight inches in height, since few Klamath men could qualify.

13. Dorsey (1901), p. 21.

14. Quoted in Pearsall (1950), pp. 348 ff. For details of wokas preparation, see Coville (1904).

15. Spencer (1956), pp. 77 ff. From time to time, I heard much the same speech directed by this woman to the boy, aged twelve. As Spencer remarks, at no time did his immediate actions give occasion for her harangue. She was, however, much concerned over some of his associates.

K M [594] 16. The term "natal family" is employed as a more graceful alternative to the conventional "family of orientation," to denote the nuclear unit into which the individual is born and within which he is reared. For similar reasons, I have preferred the term "marital family" to denote the "family of procreation," a similar entity seen from the vantage of the married partners who stand at its head. See Murdock (1949), p. 13, for a discussion of the original terms.

THIRTEEN. MODERN KLAMATH: DEMOGRAPHY AND ECONOMY

1. Lange (1953), pp. 87 ff. In Pelican Rapids and Chickamon, respectively, may be seen the county seat and the reservation community. The author was manager of a woods camp on the reservation in the early thirties. Residents deny, however, that Chiloquin's Main Street was divided as Lange described, though they recognize it in Klamath Falls.

2. The data derive from an analysis of demographic data as-
*648 sembled by Jack Pierce for the Klamath Termination Project, under
*657 the direction of Dr. Vincent Ostrom and the writer. Utilizing the pro-
• 161 visional enrollment of the tribe as published in the *Federal Register*
162 (May 13, 1955), 2,118 members, Pierce drew a random sample comprising 719 individuals. From among them were abstracted two subsets, comprising those individuals resident on the reservation and those dwelling in such urban centers as Klamath Falls, Springfield, and Eugene. Since data were few on children below the age of sixteen, they were eliminated from the subsets, which then numbered, respectively, 228 and 43.

3. Tabulation of residence of 718 individuals in the random sample, n.2, expressed as per cent.

648*
657*

Beatty	15.6	
Total Upper End		23.8
Klamath Falls	7.4	
Other Klamath County	2.0	
Klamath County		9.4
Willamette Valley		7.5
Other Oregon		7.1
California		9.3
Washington–Idaho		3.1
Other		5.1
		100.0

4. See n.3 for tabulation.

5. Henry (1958).

6. The figures come from a demographic review of a sample of tribal members above the age of sixteen, made as part of the Klamath Termination Study. For this restricted sample, the proportion of reservation population one-half or less in Indian heritage is 33 per cent. When calculated separately, the Lower End segment stands at 41 per cent, almost double the figure for the Upper End, with 24 per cent.

648*
657*
162
144

Available figures have made it necessary to compare the reservation and absentee memberships over the full age range, rather than to restrict consideration to those above sixteen. Upon this base, the over-all value for the reservation increases from the figure given above to 46 per cent, while that for the absentee membership, 72 per cent, is almost double. Thus the Lower End stands biologically intermediate between Upper End, with the highest Indian heritage, and the absentee segment, with the lowest.

7. Hadley (1957), p. 29. The figures for the United States are for 1957. 000

8. Du Toit (1959).

9. Stern and Swanson (1960).

Most Klamath live in one or another of the several
648 towns and settlements on the reservation, or else they have settled elsewhere,
361 in Portland, Salem, Eugene, in California, in Alaska, in the Midwest, or along
[167] the Atlantic seaboard. In 1955 the Tribe had 2118 members, and of these 40
percent lived away from the reservation (Stern & Swanson 1960). Partly because
[619] of the recent progress of the termination of federal supervision of the reservation, by this date the percentage of members residing off the reservation has
[161] probably increased. In fact, for years there have been numerous "tribal members"
[619] with no experience whatsoever of reservation life.

648 Throughout the years of White contact inter-marriage and inter-breeding have
144 been frequent. Today, more than 70 percent of the Tribe's members are, genetically, less than one-half "Indian," and less than one sixth are "full-bloods."
[171] Many are indistinguishable in appearance from their White neighbors, as most are
not easily distinguished in dress and language.

175 The isolation of the early reservation period was soon removed by the influx
177 of White settlers, who at first took up farms and started towns near the fringes
of the reservation. Through inter-marriage and through the consequences of
[361] allotment of land to individual Klamath, many Whites were soon residing within
the reservation's boundaries, either on the lands of a spouse, or on land bought
[423] or leased from tribal members. Another source of change were the ever present
[657] efforts of Agency officials to make over aboriginal ways, and later, the rapid
growth of the lumber industry and the development of full fledged frontier communities were also important sources of acculturative influences. In quick
[726] succession the Klamath experienced a period of armed conflict (the Modoc War of
[786] 1872-73), a religious revivalistic movement such as that which swept the plains
area, extensive governmental planning and intervention, the allotment of land
[181] in severalty, and a growing participation in the cash economy. Because aboriginal
Klamath values had stressed achieved status for those who worked to accumulate
[556] wealth and property, for some Klamath the early period of contact provided increased opportunities, and there was a group of men who for a time were effective
[436] entrepreneurs. It was through such personal efforts and through the "easy money"
had from private sales or the leasing of agricultural lands, from pro rata shares
of boundary settlements, and from per capita payments for sales of tribal timber
that the Klamath made the transition to a money economy.

648 The participation in and contribution of the Klamath to the economy of the region
is a significant point of interchange between Klamath and White, and one with
[313] many ramifications. In considerable measure, the local timber industry prospers
[423] or slumps, depending on the allotted cut in the tribal forest. Similarly,
local merchants are somewhat dependent upon the assured income of tribal mem-
[434] bers, as they are upon the purchases of mill workers, fallers, and cat-skinners.
The major town on the reservation, Chiloquin, obtains the largest share of its
[632] revenue from sales at a municipally owned beer-hall and from the fines and for-
[651] feited bails paid by visitors to the city jail, both of which establishments are
patronized largely by Klamath.

648 In other aspects of community life the participation of Klamath is perhaps best
621 characterized as that of passive spectators. Many Klamath have come to have a
sense of being aliens in the heterogeneous local culture, although there is a
563 small assimilated minority.

[571] Thus Klamath may interact as equals in card rooms and pool hall, and are met
with a stereotyped "friendliness" in interactions in stores and on the street.
However, the great majority live in intimate interdependence separate from the
main currents of White social life. White ethnic exclusiveness is reflected

132 over," so that the running waters never swell, but show the same water level
throughout the year. Nights are chilly and really cold, for the soil reflects
against the clear sky all the heat received from the sun during the day, and
the dry night air pervading the highlands absorbs all the moisture it can.
[342] Winters are severe; snow begins to fall early in November, and in the later
months it often covers the ground four feet high, so that the willow lodges
(not the winter houses) completely disappear, and the inmates are thus sheltered
from the cold outside. The lakes never freeze over entirely, but ice
[241] forms to a great thickness. The cold nights produce frosts which are very
destructive to crops in the vicinity of the Cascade Range, but are less harmful
to gardening or cereals at places more distant; and in Lost River Valley,
at Yáneks—even at Linkville—melons, turnips, potatoes, and other vegetables
rarely fail. The mean annual temperature as observed some years ago
at Fort Klamath was 40.47° Fahr.

000 There are several instances in America where highlands have become
centers of an aboriginal culture. Such instances are the plateaus of Anahuac,
Guatemala, Bogotá, and of Titicaca Lake. They contained a dense
population, more cultured than their barbaric neighbors, whom they succeeded
in subjugating one after the other through a greater centralization
161 and unity of power. The Klamath highlands can be compared to the plateaus
above named in regard to their configuration, but they never nourished
a population so dense that it could exercise any power analogous to
that above mentioned. Moreover, there was no intellectual and centralizing
element among these Indians that could render them superior to their neighbors,
all of whom maintained about the same level of culture and intelligence

TOPOGRAPHIC LIST OF CAMPING PLACES.

361 To form a correct idea of the dissemination of Indians in this sparsely
inhabited country, the following lists of camping places will furnish serviceable
data. The grounds selected by the Máklaks for camping places are
of two kinds: either localities adapted for establishing a fishing or hunting
camp of a few days' or weeks' duration or for a whole summer season, or
[342] they are places selected for permanent settlement. Winter lodges (luldamaláksh)
or slab houses are often built at the latter places; whereas the

000 one in a series of similar butcheries. Apparently it occurred in 1852, and the particulars are all given in Texts, pages 13 and 14.

175 101 131 One of the earliest reports upon these tribes made to the Bureau of Indian Affairs at Washington is that of Joel Palmer, Superintendent of Indian Affairs for Oregon, dated Dayton, Oregon, September 11, 1854. Palmer states that the lands of the Klamath Indians extend upon the eastern base of the Cascade range for about thirty miles east, and that east of them live the "Mo-docks," who speak the same language as the Klamaths; and east of these again, extending farther south, are the "Mo-e-twas" (Pit 175 649 River Indians). These two last-named tribes have always evinced a deadly hostility to the whites, and the Modocs boasted of having within the last four years murdered thirty-six whites. Palmer entered into an agreement with the Klamath Indians to keep the peace with the white people, and also sent messengers to the Modocs and Pit Rivers, believing that henceforth [161] the immigrants would be spared from their attacks. The Klamath Lakes were then enfeebled by wars with the surrounding tribes and by conflicts among themselves, and were said to number but four hundred and fifteen souls. He counted seven villages on Upper Klamath Lake, two on Pliock Creek (P'laíkni or Sprague River), three on Toqua Lake (Túkua), and one 175 411 231 on Coasto (Kohâshti) Lake.* The Indians had some guns, horses, camp equipage, and the aboriginal war-club and "elk-skin shield" (kaknō'lsh). Little Klamath Lake he calls An-coose, a corruption of Agáwesh.

714 Neither Klamath Lake nor Modoc Indians have taken any part in the great Oregon war of 1854–'56, although their sympathies were of course strongly in favor of the aboriginal cause.

000 For the year 1854 Powers records a battle fought by Captain Judy against Modoc and Shasti Indians on the Klamath River, north of Yreka, in which some women of the Shasti were killed.

The Report of 1859 speaks of continued hostilities on the side of the Modocs against passing immigrants and of the murdering of a party of five white men in Jackson County, Oregon. Two of the murderers belonged to the tribe of Chief Lelékash, and three of the perpetrators were seized and killed by the Klamath Indians (page 392).

---

* This would make only six, not seven, villages.

175 changed their settlements, as hunting nations are in the habit of doing.
648 Thus Pauline Marsh, near Silver Lake, and Pauline Lake, on one of the head springs of Des Chutes River, were both named after the Snake chief Panaína of our Texts. The bands established upon the Reservation since the treaty was concluded are called Walpapi and Yahushkin. At first they ran off and committed depredations in the vicinity, whereupon the Government was compelled to force them back. General Crook made several expeditions in the execution of the task. These campaigns were short and decisive, and the Klamath Lake scouts engaged in them did good service, as evidenced by General Crook's reports[*] and Dave Hill's Text, pages 28–33. Upon the defeat and killing of Panaína, the Walpapi chief, the tribe finally quieted down and remained neutral in the commotion caused by the Modoc war of 1872–'73.

175 161 164 No indications are at hand of the number of Indians formerly inhabiting the headwaters of the Klamath River. Before the first census was taken estimates deserving no credence were made, varying from one thousand to two thousand Indians. In those times the scourges of small-pox, syphilis, and whisky did not inflict such terrible ravages as they do now among the Indians; but instead of these the continual tribal quarrels, family vengeance, the ordeals of witchcraft, dearth of food, and the inhuman treatment of the females must have claimed many more victims than at
[523] present. Emigration and intermarriages with other tribes were rather the
[167] exception than the rule, and are so even now.

THE TREATY OF 1864.

175 648 During the ten years following Wright's massacre the country began to assume a somewhat different aspect through the agricultural and stock-raising settlements of white people that sprung up in Lost River Valley, around Little Klamath Lake and in other places. The cession of lands to the "Oregon Central Military Road Company" from Eugene City, in Willámet Valley, through the Cascade range, across the Klamath Marsh, to

---

[113] [*] Contained in the Report of the Secretary of War, 1868–'69, Part I, pp 69, 70, dated September 2, 1867, and March 19, 1868. The troops killed twenty-four Snake Indians in the expedition of 1867. See also Texts, Note to 28, 14.

648 1888 and 500 broken by them; 10,000 acres were inclosed by fences.
657 The crops of 1888 amounted to 8,000 bushels of wheat, 4,000 of oats and
241 barley, 1,000 bushels of vegetables, 3,000 tons of hay; and 500 pounds of
231 butter were manufactured. Of lumber 100,000 feet were sawed. The
313 Indians transported with their own teams 500 tons of freight, and thereby
434 earned $1,500. The two boarding-schools, one at the Klamath Agency
and the other at Yáneks, in the same year boarded 215 pupils at a cost to
the Government of $18,764—about $10.40 a month per capita.

311 The number of acres contained within the Klamath Reservation is 1,056,000, and of these only about 20,000 acres are considered to be tillable land. The rest is occupied by woods, marshes, rocks, and other hindrances to cultivation.

797 The school and church interests are in the hands of the Methodist Episcopal Church, which also has a vote in the appointment of the United States agent.

657 The statistics of population have furnished reliable data only from the
161 time when annuities were first distributed among these Indians. This ne-
162 cessitated an annual count of each family, giving the number of the individuals belonging to each. One of these was made during my presence on the reserve on October 30, 1877, before the winter supplies were dealt out to the tribe. The summary is as follows:

David Hill, chief, at Agency and on Williamson River	225
P'lú, head chief, at the bridge, Williamson River	122
Long John, chief	103
Jack, chief	92
Lílo, chief	23
Total	565

The census taken in the Sprague River Valley, Yáneks subagency, furnished the following figures, Klamath Lake Indians and Modocs being indiscriminately included:

Littlejohn, chief	14
Skóntchish, chief	18
Modoc Johnson, head chief	71
Ben, chief	61
Brown, chief	30
Total	194

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

161 The Snake Indians were not counted at that time, but were assumed
657 to have the same population as in 1876: 137. This gives a total of Indians
162 for the Reservation of 896. This count included about eight mixed bloods and seven Warm Spring Indians from the Des Chutes River. The boarding-school at the Klamath Agency then had eighteen pupils of both sexes.

The reports of the Indian Commissioner for 1880, 1881, 1882, 1883, and 1884 can not be fully relied on, since they give the same figures for *each* of these years with an unvarying total of 1,023 Indians—Klamaths, 707; Modocs, 151; Snake Indians, 165.

The report of 1888, Joseph Emery agent, gives 788 Klamath Lake and Modoc Indians and 145 Snake Indians, a total of 933 individuals.

Probably the most reliable data were furnished by the Indian census made in 1881 for the United States Census Bureau, from March to August:

	Klamaths.	Modocs.	Molale.	Snakes.	Totals.
Total of tribes on Reservation	676	122	55	165	1,018
Number of males	286	58	30	80	454
Number of females	390	64	25	85	564
Unmarried at fourteen years and upwards	109	6	9	11	135
Number married	286	55	14	65	420
Number of full bloods	664	122	53	165	1,004
Number of mixed bloods	12	....	2	....	14
Number below twenty-one years	291	58	35	89	473
Number above twenty-one years	385	64	20	76	545
Supported one half or more by civilized industries	36	6	7	....	49
Supported one-half or more by Government	38	3	....	2	43
Number wearing citizens' dress	630	112	55	165	962
Acres under cultivation	2,249	140	36	....	2,425
Number attending school	36	1	....	3	40

This enumeration is remarkable on account of the large number of Molale Indians mentioned in it, an element of the population which is nowhere else designated as such in the periodical reports made by the agents.

a warrior he became.

The subdivisions or tribelets are:

I. ă'ukekni, the people of Klamath marsh and middle Williamson 101
river, the Klamath proper. Evidently the Sprague river people are 131
included here; there is some doubt, but I am even more doubtful 619
whether there were settlements as far away on Sprague river as
Yainax in pre-reservation times.

II. kowa'edikni, those of a village of that name on Agency lake. They may be ă'ukekni.

III. du'kwakni, on the delta of Williamson river. These are more closely affiliated with the Pelican bay people than with ă'ukekni.

IV. gu'mbŏtkni, those of Pelican bay and the marsh to the north.

V. iu"laloŋkni, the people of Klamath falls (Link river) and the eastern shore of Klamath lake.

The names are those of the districts they occupy with the suffix -kni, those of, people of: ă'ukei, Klamath marsh; du'kwa, the district about the mouth of Williamson river; gu'mbŏt, Pelican bay, possibly taking its name from Rocky point; iu"laloŋᴇ, on the end, the village at the outlet of the lake into Link river.

It is now difficult to get a true estimate of the size of these groups. 361
The ă'ukekni count twenty-nine or more settlements, half of the total; 162 •
of the others iu"laloŋkni have thirteen, gu'mbŏtkni seven or more,
du'kwakni five, and kowa'edikni, one. The towns vary considerably
in size, yet this mere count agrees closely with the populational pro-
portions as my several informants phrased them. The ă'ukekni are
by far the largest group, perhaps as large as all the others together.
Nancy Phillips recalls the large number of children who played [115]
together at gu'mbŏt, Pelican bay. At this place the settlements do
form a large compact group. Next in order she places the du'kwa
group, then those clustering about iu"laloŋᴇ at Klamath falls, and
goyᴇmske'ᴇgls on Williamson river. The settlements on Williamson
river are small and scattered, but she places their joint population
above the gu'mbŏtkni. The iu"laloŋkni were comparatively few
despite their large territory. Of the ă'ukekni more lived at Klamath
marsh even in winter than on Williamson river. The huge size of a
single site, du"llkūt, bears this out.

Consonant with their unequal size is it that the principal chief, at 619
least in early reservation days, was the principal chief of the ă'ukekni; 622
all others were distinctly subordinate in prestige. According to one
informant, himself a du'kwa man, the ă'ukekni are the highest people. [829]
Kᴇmū'kŭmps, the culture hero, made them first, best, and strongest;
later he made the others.

K *657 *648 726 M 657 648 726 were mustered out of service. Subsequently, when Jack and his followers slew the Peace Commissioners, Oliver Applegate reported that the reservation Indians were ready to take the warpath against them in revenge, but they were not called upon.[40]

K *657 *648 728 M 657 648 728 In the end, the Modoc were defeated and the leaders tried at Fort Klamath. During the hearing, they attempted to implicate the Klamath, with claims that Link River Jack had cached ammunition for them and that Schonchin—"the noblest Roman of them all!" exploded Oliver Applegate indignantly—had brought them a message from Allen David promising aid if they would hold out a little longer. The countercharges proved misdirected as defense; and in the presence of the reservation Indians and other spectators the leaders of the hostiles were hanged or committed to Alcatraz; and the remainder, 153 in number, were shipped off to Fort Quapaw, Indian Territory.[41]

K *657 *648 M 657 648 With the end of the war, the reservation became in effect a closed political system. The only exception was Ocheho's band of Paiute, which alternated between the reservation and their Warner Valley homeland until 1876, when the major part of them remained off the reservation for good. K [643] Meanwhile, with no salary forthcoming to offset the heavy financial burdens of his office, Allen David resigned, and Henry Blow was elected in his stead.[42]

K *657 *648 622 643 The statement made in 1877 by Dave Hill gives a fair idea of the chiefs of the time and contrasts the hierarchy at the Agency with the comparatively open order at Yainax.

> M 657 648 622 643 We Lake People live here thus: Blow is chief of all, and I, Dave Hill, am chief second to Blow, Long John after Dave, then too Link River Jack after Long John, and Lilu. Pit River Charley is chief of the Pit River people at the Lake. Ben and Littlejohn are the chiefs, and Schonchin is chief of the Yainax people. Johnson is chief of the Modoc at Yainax. George Kuatilak also is Modoc chief after Johnson. Chocktoot is chief of the Paiute.[43]

K • [162] M [162] Gatschet's list for the same year, which includes the adherents for each leader, differs somewhat from that of Hill. At the Lower End, the chiefs, all Klamath, and the number of their followers were: Blow, head chief (122), Hill (225), Long John (103), Link River Jack (92), and Lilu (23). At Yainax, the Modoc bands

K
comprised those of Modoc Johnson, head chief (71), and Schon- 657*
chin (18). The Upland Klamath leaders were Brown [i.e. Monchn- 648*
kasgitk] (30), Ben (61), and Littlejohn (14). 622
643

Gatschet thus omits Pit River Charley at the Lower End and 162 •
the adherents of George Kuatilak and Chocktoot at Yainax, but M
includes that of Monschnkasgitk. If the Klamath and Modoc 657
followings are separately totaled, the figures agree closely with 648 622
those of the statistical summary for that year,[44] suggesting that 643
the Pit River chief was subsumed under one of the Klamath 162
leaders and George Kuatilak under Modoc Johnson. Note that
the Paiute, who seem to be predominantly Walpapi, account for
137, almost half the Yainax total of 331, while the Lower End,
with 565, then contained almost twice as many people.

The replacement of leaders had already gone far: Of the chiefs K
listed above, only five, Blow, Jack, Lilu, Schonchin, and Monchn- 657* 648*
kasgitk, had been prominent enough in 1864 to sign the treaty; 622
and only Lilu, Monchnkasgitk, and Schonchin were then noted 643
chiefs.[45] By 1877, their followings had dwindled, amounting to M
only a fraction of their previous numbers. Most of the losses had 657
been to Agency men advancing in favor. Among them Dave Hill 648 622
far outstripped even Henry Blow, the head chief, in adherents. 643

Beneath this system, we know from the accounts of elderly
Indians, a system of informal local headmen continued. Some K
of these individuals were, indeed, also favored with a measure 657*
of government support. Among them were some of the older 648*
chiefs, now out of official power. Lileks was put in charge of a 622
ferry across the river—probably the Williamson—where he kept
track of passengers by drawing pictures of a man, mules, and so
on.[46] Allen David, still a chief, figured among the progressive
Indians for some years. In 1883, however, his quiet opposition to
Agency inroads upon the remaining chiefly authority drew re-
marks from Nickerson:

> There is but one man, Allen David, 3rd chief, who in any way proves a hinderance [sic] to the discharge of duties of the police. He does not do this openly, but covertly and slily, and is ready with a denial when charged with it. I have been seriously thinking of depriving him of his position and power as one of the cheifs [sic]. Indeed, I think the time is not far distant when this tribe will be better off without any chiefs whatever.[47]

*657
*648 tunities of the reservation. As they moved away, they extended
563 Indian experience into the midst of frontier society. During the
167 allotment period they in turn enlarged reservation perspectives.

*657 The majority of the interbreed children that appeared upon
*648 the early reservation, then, were the product of temporary or
563 unstable unions and appeared as fatherless children. The annual
• 162 reports are unrealistic as to their number. In 1885, for example,
it was claimed that there were only 12 interbreeds in the total
population of 919,[9] although to judge from later censuses, the
number must have been several times as great.

*657 One of the long-range results of this intercourse was to reduce
*648 somewhat the difference in physical appearance that separated
563 the Indians from the surrounding population. Another—and more
[144] immediate—consequence, however, was to raise the divisive issue
[848] of illegitimacy among the Indians themselves and to introduce
[602] into the tribal body individuals who could claim only maternal
kinsmen. Thus, one Klamath recalls his father, a stage driver in
Klamath Falls, as a drunkard whom his mother finally left. The
family returned to his maternal grandparents, in whose care the
boy grew up. His mother subsequently married a man who ran
a logging camp at Pelican Bay, a hard worker and good hunter
who treated the boy well. Nonetheless, throughout his life he
bore an animus against his father and in part against the heritage
he represented.[10]

*657 Interracial unions were encouraged, not only by a dearth of
*648 white women but by an early preponderance of women among
563 the Klamath and by regulations which put an end to polygamy.
162 The early imbalance between the sexes was striking. The figures
[595] supplied by Captain Kelly for the adult Klamath in 1864 give a
sex ratio of no more than 0.47.[11] Those for the Link River band
two years later areonly a little higher for the adults, 0.52, although
the overall figure is 0.64, since boys and girls are in
approximate balance.[12]

[164] Neither sex-linked disease nor the practice of selective infanticide
[847] is known to have occurred among the Klamath, and the most
probable explanation must be sought among such factors as
differential exposure to rigorous training, warfare, and vicissitudes
of the food quest, as well as to possible emigration of single
men. O. C. Applegate, the only Agent to comment upon the im-

balance, ascribed it to war and stated that in 1864, "the females 657*
were largely in the majority . . . a condition which continues . . . 648*
to this day."[13] 563
162

That the sources were indeed to be found in the conditions of native life is suggested by the circumstance that subsequently the imbalance was reduced: about 1875, the overall ratio was 0.72; while by the latter part of the period, from 1885 to 1906, it had reached an average of 0.87. It has since continued upward, to attain the approximate equality that characterizes the white neighbors of the Klamath.

Freed slaves constituted a second novel element in the popula- 657*
tion. Marriage to a slave had once been scorned, though Chief 648*
Chiloquin himself had married a Shasta slave; and even today 567
some stigma is attached to slave descent, albeit it is likely to be 178
brought up only as damaging gossip. Both sentimental family 177
attachments—a traditional attitude transcending acknowledged differences[14]—and recognition of the achievement of former slaves went far to ameliorate their position. One slave, Charlie Pitt, had been raised with his captor's son, Drummer David, in fraternal amity. The bond remained strong through life, and Charlie willed David his property when he died.[15] Another, one of three captured Pit River brothers, escaped to friendly whites who raised him in Ashland and gave him the distinguished name of Stonewall Jackson. In 1878 he returned to the Agency and the following year became a sawyer's apprentice. In recommending an increase in salary for him, Nickerson remarked that he "speaks the English language fluently, & is what may be called a civilized Indian." With several offers at better wages off the reservation, he wished to remain until he could qualify as a competent sawyer.[16] The best known of the slaves was Henry Jackson, whose rise has already been sketched. It is worth noting that he married the daughter of a Modoc chief, and that tribal members from over the reservation were not too proud to accept his bounty.

The altered social order was characterized by greatly in- 657*
creased mobility. An entire new range of opportunities was open 648*
to those who possessed or could develop new skills. Opportunity, 555
however, fell unequally, for the major new enterprises and posi- 177
tion in nineteenth-century America were masculine. As they were 178
incorporated into the regular activities of the Agency and within [562]

[Klamath Reservation]

K

circumscribed. Because the step involved a wholesale commitment, 657*
those bold enough to marry whites, as already noted, 648*
tended to pass out of reservation society. One or two women in 562
the early days sought to demonstrate they they could support 177
themselves as well as men were capable of doing, but they were 178
clearly exceptional.[18] K

Confronted by shifting social values, tribesmen on the reserva- 657*
tion still could take assurance from a value acknowledged both 648*
by the whites and by their traditional culture. The high prestige 556
assigned to industry and to its material manifestation, wealth, 181
proved a common denominator upon which to rank the ability of 178
men engaged in new activities. In the new day, Plains garments, K
horses, and slaves were outmoded, and were replaced by a house [177]
and outbuildings, a fenced farm or ranch, wagons and buggies,
and plenty of livestock. K

Within this context, the family also changed as movements 657*
within the reservation, the construction of smaller frame dwellings, 648*
and the cultivation of individual farms reduced household 592
size to approximately that of a single conjugal family. Some idea 177
of the shift may be gained by comparing subsistence rolls from 178
the administration of Lindsay Applegate[19] with data from the K
end of the period. A summary of issues made in 1872-73 to heads 657*
of families of Klamath, Modoc, and Yahuskin Snakes lists 54 648*
families totaling 658 persons. The majority were from Klamath 592
Marsh, with some from Link River and Sprague River bands and 162 •
several Modoc. One is possibly Paiute. The other two pages N M
duplicate some of the individuals, listing Schonchin's band of 657
Modoc, some eight "houses" comprising 97 individuals; Ocheho's 648
band of Warner Valley Paiute, 17 "houses" and 161 persons; 592
Chocktoot's band of Paiute, 13 "houses" and 113 persons; and 162
the Sprague River band of Monchnkasgitk, 8 "houses" and 97
individuals. A tally made in 1866 by one Jackson Jones (Link
River Jack ?), "Chief of Ulalona," lists for the Link River band
22 men, 18 boys, 42 women, and 20 girls in five houses.[20]

An analysis of these three lists reveals interesting facts about K 657*
the contemporary social groupings. Where the two censuses overlap, 648*
there is overall agreement, although the figures for individual 592
households differ slightly. For the census of the Klamath at 162
large, the average household size is approximately 12 persons,

*657 and this corresponds fairly closely with averages from the listing
*648 of Upper End bands. Only the Link River tally is aberrant, with
592 an average of about 20, far above the figure to be obtained from
• 162 those Link River households included in the census of the tribe at
large. Since the tally was made in September, it may reflect the open living conditions of that season.[21]

*657 Household size ranges from 27 persons down to 2, the latter
*648 figure for the household of a widow. Households of known chiefs
—taking as criterion a signatory to the treaty of 1864—are well
592 above the average, ranging generally between 22 and 15, with
622 only those of the Modoc, Schonchin, and the Paiute, Ocheho,[22]
162 falling below. However, as will be seen, chiefly households were not the largest in absolute figures: those of some of their followers exceeded them. The large households indicated here
[178] point to the continued presence of the extended family as a
residential group.

*657 By contrast, the census of Slabtown, a small settlement near the
*648 Agency occupied primarily by Agency employees in 1901, shows
13 households comprising house head, wife, and from three
592 children down to none, with an average of 1.4. In one family a
162 girl past school age, and in another a grown son, were among
the children. In addition to those children at home, the families had others in school, in the same numerical range and with the same average. The total family size ranged from 2 to 8, with an average of 4.7. Because some of the family heads, perhaps all, were young at this time, family size may thus have been somewhat skewed.[23] Nonetheless, the contrast of these households comprising conjugal families with those occupied by extended families forty years earlier clearly demonstrates the residential fractionation of the larger units.

*657 A seasonal mobility still characterized the Klamath family.
*648 Nickerson mentioned in 1884 that the heads of reservation families—from one-half to two-thirds of the men—had been away for
166 the last four months, and added, "They generally take their
families with them on such occasions."[24] Similarly, in a predecessor of Slabtown, over fifty families engaged in hauling logs on sleds to the sawmill camped in tents in January to be near their work.[25]

000 Of all the societal relationships, the government sought directly

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

648*

allotments on the public domain, Applegate advocated that they 657*
relinquish them in favor of tracts upon the reservation.[28] 423

For tribal members, the enrollment of outsiders was often 619
objectionable; although opposition was less to their being [623]
granted allotments upon the reservation than to admitting them to equal shares in the tribal funds. By the terms of the McLaughlin Agreement of 1901 settling boundary claims, over a half-million dollars had been entered to tribal credit, part of which then became available to tribal members in per capita payments. As Applegate wrote to one off-reservation member, "there are a good many who would like to see people who do not live on the Reservation cut off from all benefits of the Treaty."[29]

In 1903, Applegate had estimated that there were "about 185 nonresidents, a number of them allottees though not residing on the reservation—with them are about 80 children of school age, many of whom are attending white schools."[30]

Analysis of the annuity payments from trust shares sent out 648*
between November, 1907, and January, 1908, reveals interesting 657*
characteristics of the nonresident membership. Omitting shares 619
to 13 students (8 girls, 5 boys) at off-reservation schools, payments went to 6 married couples, in which both parties were enrolled members, and to 39 women and 14 men either single or married to nonenrolled spouses. In addition, shares were sent to these adults for a total of 51 children. Children's shares were sent to 4 married, enrolled couples, to 14 enrolled mothers, and to only 2 enrolled fathers. While other explanations are plausible, the figures are highly suggestive of a preponderance of off-reservation marriages between Indian women and white men.

From the point of view of geographical distribution, the off- 648*
reservation population is also of interest. The table below, which 657*
excludes scholars sent away to government schools, presents the 162
salient features:

Of the off-reservation members, those at Fort Klamath and Klamath Falls were to be of most immediate importance,[31] for many of them continued in touch with some of the progressive leaders. Thus, as time went on, Fort Klamath became the headquarters for Jesse Kirk, whose allotment was nearby, for William Crawford, for William Ball, and for the returned Modoc, Charles S. Hood.

M 648 657 162 The band of absentee Modoc formed an important increment to the reservation population. At Quapaw, in what was then Indian Territory, they had won the praise of Commissioner E. A. Hayt, who had shown their farms to another former hostile, Chief Joseph of the Nez Percés, to encourage his people to make similar progress.[32] In 1884, Steamboat Frank, formerly a Hot Creek warrior under Captain Jack, later a member of A. B. Meacham's troupe, and now a minister of the denomination of Friends, returned to visit his relatives and, as it turned out, kindled religious fervor with his preaching.[33] M [797]

K *648 *657 162 M 648 657 162 Following 1886 several other Modoc were permitted to revisit their old homeland. Not until 1902, however, did the Klamath meet in council to hear the Modoc delegates, Rev. Samuel Clinton and Charles S. Hood, submit the proposal that the Modoc be permitted to return and take up homes on the reservation. They failed to carry their point,[34] but subsequently it was approved; and the following year Charles Hood led a party of his people to the Upper End. Applegate counted 21 and stated that 47 others also wished to come.[35]

K M [423] Early in 1909 an act of Congress finally authorized their allotment at Klamath. Within the month Superintendent Wilson was

423

visited by a large delegation of Klamath, headed by Henry Wilson, member of the tribal council, who wished to send the Superintendent to Washington on a number of issues, of which the first was that "we have heard that the Modoc Indians are to come back here and get lands and money the same as we do; we do not like that and want our side explained to you. . . ."[36] Later that year, the Superintendent certified 16 Modoc for allotment, observing however, "I do not believe that Congress intended to simply let the Modocs return and get allotments and then return to Oklahoma to live. This is, however, exactly what some of them intend to do."[37]

Allotment thus brought back to the reservation persons who had already made extensive adjustment to the larger society. Applegate, indeed, asserted that "nearly all of these people who have been allotted lands have become residents of the reservation,"[38] but the figures already reviewed show a sizable number remaining away. Despite the fact they did not in any other way identify their interests with the reservation community, they received equities in lands and in the undivided tribal fund.

Finally, the right of tribal members to allotment was affected by the closure of the rolls. The original allotments had been made in 1895 and were resumed in 1909. At that time, however, considerable discontent was generated by the exclusion of all children born after April 15, 1910. Those born later, although tribal members and as such retaining an equity in tribal property, did not receive a share of land. Their parents agitated for two years to have allotments issued to them. Although they were granted permission to select tracts on behalf of their children, it was with the understanding that their choice would have no legal status. Meanwhile, the Bureau opposed allotments for these new members. Not until the Yamsay Judgment of 1938, with the successful conclusion of the Military Road suit, were funds set aside by the Klamath Tribe for in-lieu payments of $1,500 to each unallotted member.

K

In this manner, then, allotments were made. To qualify, an individual had to be a tribal member, born before the terminal date in 1910. Membership was determined at times by the tribal council, at times by the Agent, employing a standard that wavered between the two criteria of proven kinship and habitual

648*
men. The major attractions, however, were the stores, the schools, 657*
the movies, the excitement, and the entertainment. These ad- 16
vantages seem likewise to have favored the shift to larger communities.

Thus, over an extended period of time, there has been a substantial and growing body of Klamath who, while retaining an equity in the tribal estate and membership in the tribal body, have come to dwell away from the reservation and who visit it infrequently, if at all. Their daily life is spent within a milieu, and in reliance upon a "personal community"—to use Jules Henry's expressive term[5]—made up largely of non-Klamath.

The heterogeneity of the Klamath is also reflected by their 648*
biological composition. While the characterization of the degree 657*
of Indian heritage, expressed as a "blood quantum," is open to 144
occasional error in individual instances, the figures taken in summation reveal significant differences. By 1955, only twenty-eight per cent of the absentee members could claim to be biologically of over one-half Indian ancestry, and even for those dwelling upon the reservation the corresponding figure was no more than fifty-four per cent. Within the reservation, in turn, Lower End Klamath were markedly less Indian by this measure, falling between the values for absentee and Upper End members.[6]

Like many other Indian groups, the Klamath population pos- 648*
sesses a large segment of younger members, marking an increase 657*
over the early decades of the present century. In the days of 162.
termination, those under twenty years of age comprised no fewer than forty-seven per cent of the total tribal membership, a figure exceeding that for the general population of the United States, of which only one-third fell within the corresponding
bracket.[7] Although these figures are often interpreted as re- [563]
flecting improved health conditions on the reservation, they also
reflect an increased rate of marriage with non-Indians.

The variety of Klamath life during the latter days of their 648*
tribal existence may be illustrated by data from the Upper End 657*
community of Beatty, the Lower End city of Chiloquin, and 184
from the off-reservation communities of Klamath Falls and 361
Eugene-Springfield in the Willamette Valley.

Beatty and Chiloquin represent special facets of reservation

*648 history. Beatty, in the upper valley of the Sprague, lies between
*657 the town of Sprague River, some fourteen miles below it, and
184 Bly, roughly the same distance away over the eastern boundary
361 of the reservation. It drew some of its population from Yainax,
when that subagency was closed, as well as from Paiute Camp
[797] to the east. Beatty's nucleus had been the Methodist mission and
store, to which other establishments presently were added, and
houses began to be built about them. White ranchers have
[563] moved in to work the allotted land they bought or rented, usually
bringing their families with them. Others, white, Indian—using
that term for non-Klamath—and Negro, have married tribal
members.

(871) By 1959, however, when the community was studied,[8] it was
in a sharp decline: for in the 1940's the local school had been
[797] closed in a consolidation with the one at Bly; the Methodist
[313] mission had been reduced to an adjunct of the principal mission
on Williamson River, at the Lower End; and the lumber mill
at Sprague River had ceased operations. The community had
• [162] survived, though on a greatly reduced scale, with a population
totaling 136 persons, 105 of them tribal members, prevailingly of
Modoc and Paiute derivation, 5 Indians from other reservations,
25 whites, and 1 Negro.

Chiloquin, located at the confluence of the Sprague and Williamson rivers, was the largest community on the reservation, with a population then almost seven times that of Beatty.[9] A mill and market town which burgeoned when tribal timber was opened by the advent of the railroad, Chiloquin was incorporated as a city in 1926 and soon afterward boasted a population, including adjacent woods camps, of approximately two thousand. In its heyday, when along with Modoc Point, Braymill, and Sprague River it pulsed with activity, Chiloquin was a lusty and sometimes rowdy city, enjoying the wicked sobriquet of "The Little Chicago of the West." Below the surface was a structure which provided an institutional extension of American civic life elsewhere. A bank, a newspaper, telephone company, hotels and rooming houses, schools and churches, a boxing association and occasional Chatauqua, moving picture house, taxi company, Ladies' Community Club, Commerce Club, Masons and V.F.W., lawyers, dentists, and doctors: all these shared space with dancehalls, card rooms, bootleggers, pimps, and prostitutes.

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

The depression and the subsequent loss of mills through fire 648*
and economic distress stripped Chiloquin temporarily of many 657*
of her specialized services. By the time she had emerged from 184
the slump a decade after World War II, improved communica- 361
tions had enabled Klamath Falls, twenty times as large and only thirty miles away, to supplant Chiloquin in many functions which had previously been discharged locally. Nonetheless, in the course of recovery some services were regained. With an institutional complexity that far transcended that of Beatty, Chiloquin, an enclave of the state of Oregon within the federal jurisdiction of the reservation, offered tribal residents a foretaste of the life that lay beyond reservation boundaries. In 1958 more than thirty per cent of the entire tribal membership had mailing addresses there.

In examining the households of Beatty and Chiloquin, re- 648*
spectively 31 and 297 in number, it is convenient to distinguish 657*
two categories among those including tribal members. That 621
designated Interethnic is headed by a tribal member married to 184
a partner of another ethnic group, white, Mexican, alien Indian, 563
or other. The second, in which both partners are tribal members, 592
will be designated Tribal. The term Klamath will subsume both. [162] •

Klamath households in the rural community of Beatty in 1959 comprised well over eighty per cent of the community, the remaining households being largely white. By contrast, in Chiloquin (1949-50) white households were twice the Beatty percentage; while Klamath households amounted only to little over half the population. The remaining ten per cent was made up of other minorities, Mexican, Negro, and Indian. Within the next decade continuing trends in Chiloquin increased the disparity, as white households gained at the expense of all other components.

The figures for Interethnic marriages harmonize with this picture of white preponderance in the larger community. When the total marital record is considered, including successive mates, it is seen that unions with whites comprise only slightly more than one-fifth of the total for reservation members, almost one-third for the Chiloquin segment, and well over three-quarters for a small sample of off-reservation Klamath.[10] Among the Interethnic households of Beatty, the non-Klamath partner was more frequently Indian than white, while in Chiloquin he was

*648 generally white. When it is considered that in American society
*657 the husband maintains significant external relationships,[11] it
184 seems significant that in both Chiloquin and Beatty in some three-
621 fourths of the Interethnic households the husband was an out-
563
592 sider and the wife a Klamath.

ECONOMIC LIFE

*648 From an economic standpoint, tribal members occupied a
*657 subsidiary position in reservation communities. Their participa-
621 tion in productive activities as a whole was small. In 1958, a
434 sample of the reservation population showed the following eco-
464 nomic profile: presently engaged in business or ranching, eigh-
• 162 teen per cent; previous record of such experience, eleven per cent; no such experience, forty-eight per cent; no data, twenty-three per cent. The figures for those resident in Chiloquin showed, if anything, a lesser degree of direct participation. Available records on a small absentee sample (but one with a higher proportion of women) do not reveal a higher degree of economic experience. The figures are: presently engaged in business or ranching, seven per cent; previous record of such experience, twenty-one per cent; no such experience, seventy per cent; no data, two per cent.

*648 The record of scanty business experience is in large measure
*657 a consequence of the steady flow of income from tribal timber.
434 In 1950, the $800 per capita payments enabled a Klamath family of four to exceed the median income for all families in the county.
454 Since they could also hunt and fish throughout the year, and many families did, their actual income was considerably higher. There was thus little incentive to work to supplement timber revenues. The Meriam committee, to be sure, had observed years before, in the course of their comprehensive study of Indian administration, that the Klamath per capitas were too small for investment and thus tended to be disbursed for current living expenses;[12] but it is also true that, lacking investment experience, tribal members who realized substantial sum from the sale of allotments too often treated them as windfalls to be squandered, rather than as capital capable of bringing further financial returns.

000 Comparison with the record of white performances places the

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

Comparison
with the record of white performances places the 648*
tribal picture in perspective. In Beatty, six out of seven white 657*
househeads were employed. A sample taken in 1950 including 464
almost every white household in Chiloquin showed that all the [illegible]72
men save those who were ill or retired were gainfully employed, 171
and that in thirty-seven per cent of the households wives or junior
members also held jobs.

By this token, the Klamath had come to occupy a marginal 648*
position as economic producers. That this had not always been 657*
true is shown by the record of those who in the early days of 464
Chiloquin had tried their hand at business; and several continued 433
to maintain themselves by ranching or business. The large majority of the men, however, were content to labor seasonally as unskilled farmhands. The undependability of some workers had generated an adverse reputation among potential employers for the Klamath as a whole. The industrious Klamath came to be viewed as exceptional.

Thus, even on their own reservation, the Klamath stood beneath the shadow of economic structures dominated by whites. This condition was, of course, true for the reservation as a unit; for distant interests dictated that it should be devoted to the production of lumber, beef, power, and to communications. Within the several communities the major enterprises were also controlled by whites. To be sure, there were checks upon the
ruthless exercise of economic power. Local awareness of interdependence, [623]
the intimate acquaintance developed in the daily life of a small community, and the knowledge that the tribal council controlled the fate of timber contracts upon which the community depended: all these served to temper purely economic
decisions. The exercise of a credit system by storekeepers [452]
in the face of lower prices in Klamath Falls, the good faith they expected of their customers, and the occasional need for hired hands by ranchers, were equally conducive to restraint.

Klamath families who chose to farm were often similar to their [241]
white counterparts in the concentration which they devoted to their farming; and they often exchanged labor or equipment with white neighbors. There were few successful farmers among
tribal members, perhaps no more than a dozen in all. By contrast, [233]
there were those in the countryside who chose to follow other
time-honored values than industry, giving precedence to per-

7

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 *657 619 641 Tribal membership was, as we have seen, only one of several political roles in which Klamath might participate, and in some measure it lay athwart the others. Citizenship in the United States, granted generally to American Indians in 1924, affiliation with state, county, and municipality: these political memberships are explicit in character, conditional upon the fulfillment of stated requirements and with the exercise of well-defined rights. Superficially, tribal membership appears to possess a similar character. In the admission of new members, both the establishment of qualifications and the decision upon individual candidates rested with the Tribe, though subject to review by the Bureau of Indian Affairs. Applicants had to be of Klamath parentage on at least one side, and those of one-quarter or more Klamath heritage were automatically admitted upon application. In 1945 a clause was added permitting adoption of members of one-sixteenth heritage, contingent upon assurances that they would reside upon the reservation and participate in tribal activities.

In practice, Indian heritage of any sort, and not merely that stemming from the Klamath Tribe, was reckoned in; and token assurances of participation and residence have conventionally [161] been accepted. Of the final enrollment of 2,133 tribal members, • [162] 86 fell within the category of one-sixteenth quantum. Of these, 12 dwelt on the reservation and another 12 in Klamath Falls, the remaining 62 residing at some distance from the seat of tribal government. Once enrolled, members have not been subject to review, save when their original qualifications were called into question.

In a membership that was not conditional upon performance, [602] the Tribe had a great deal in common with such ascriptive en- [621] tities as the family and ramified kin, the traditional tribe, and the broad regional communities into which the latter had tended to cluster.

Family loyalties have been at once strong and selective. At times, they have provided continuities of interest within a single [602] line. Here, for example, were the Rev. Jesse Kirk, himself the son of a treaty signatory, and his sons, Clayton, Seldon, and Jesse Lee; here old chief Monchnkasgitk, and his sons, Harrison and Henry Brown; here Judge William Crawford, his wife, Eliza, and their son, Wade; here Henry Jackson, his half-brother, Ike, and the latter's son, Boyd Jackson.

THIRTEEN. MODERN KLAMATH: DEMOGRAPHY AND ECONOMY

1. Lange (1953), pp. 87 ff. In Pelican Rapids and Chickamon, respectively, may be seen the county seat and the reservation community. The author was manager of a woods camp on the reservation in the early thirties. Residents deny, however, that Chiloquin's Main Street was divided as Lange described, though they recognize it in Klamath Falls.

2. The data derive from an analysis of demographic data as-
*648 sembled by Jack Pierce for the Klamath Termination Project, under
*657 the direction of Dr. Vincent Ostrom and the writer. Utilizing the pro-
161 visional enrollment of the tribe as published in the *Federal Register*
• 162 (May 13, 1955), 2,118 members, Pierce drew a random sample com-
prising 719 individuals. From among them were abstracted two subsets, comprising those individuals resident on the reservation and those dwelling in such urban centers as Klamath Falls, Springfield, and Eugene. Since data were few on children below the age of sixteen, they were eliminated from the subsets, which then numbered, respectively, 228 and 43.

3. Tabulation of residence of 718 individuals in the random sample, n.2, expressed as per cent.

Reservation:			648*
Chiloquin	30.5		657*
Modoc Point	0.3		161
Klamath Agency	3.9		162 •
Total Lower End		34.7	
Sprague River	8.2		
Beatty	15.6		
Total Upper End		23.8	
Klamath Falls	7.4		
Other Klamath County	2.0		
Klamath County		9.4	
Willamette Valley		7.5	
Other Oregon		7.1	
California		9.3	
Washington–Idaho		3.1	
Other		5.1	
		100.0	

4. See n.3 for tabulation.

5. Henry (1958).

6. The figures come from a demographic review of a sample of 648*
tribal members above the age of sixteen, made as part of the Klamath 657*
Termination Study. For this restricted sample, the proportion of reser- 162
vation population one-half or less in Indian heritage is 33 per cent. 144
When calculated separately, the Lower End segment stands at 41 per
cent, almost double the figure for the Upper End, with 24 per cent.

Available figures have made it necessary to compare the reservation and absentee memberships over the full age range, rather than to restrict consideration to those above sixteen. Upon this base, the over-all value for the reservation increases from the figure given above to 46 per cent, while that for the absentee membership, 72 per cent, is almost double. Thus the Lower End stands biologically intermediate between Upper End, with the highest Indian heritage, and the absentee segment, with the lowest.

7. Hadley (1957), p. 29. The figures for the United States are for 000
1957.

8. Du Toit (1959).

9. Stern and Swanson (1960).

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 175
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common 101
experience and status as Indian in contrast to White, the contemporary Klamath 177
may be considered as one people. This section consists of a sketch of today's
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the 162
reservation's population.

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 13
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological [184]
aspects of these water courses were essential to the aboriginal Klamath economy, [224]
as they are essential to the recreational hunting and fishing of the present
population, White or Klamath. [226]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly 648
White culture. For nearly a century they have maintained multiple loyalties:
to the Agency, which represents the Government, to the Tribe, which was an artificial [829]
construct and has seldom been a viable corporate group, to the local
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet
in the same years the Klamath have also acquired and learned much, and it would 178
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-residence
with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White [181]
men of the Klamath. Instead, there has developed a variant socio-cultural
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been transferred 648
to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not [241]
utilize these resources. These latter homesteads are little more than rural
slums, the scenes of perennial drinking parties. For decades the timber industry [511]
has been the mainstay of the local economy, but relatively few Klamath have
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

648 657 241 231 313 434 1888 and 500 broken by them; 10,000 acres were inclosed by fences. The crops of 1888 amounted to 8,000 bushels of wheat, 4,000 of oats and barley, 1,000 bushels of vegetables, 3,000 tons of hay; and 500 pounds of butter were manufactured. Of lumber 100,000 feet were sawed. The Indians transported with their own teams 500 tons of freight, and thereby earned $1,500. The two boarding-schools, one at the Klamath Agency and the other at Yáneks, in the same year boarded 215 pupils at a cost to the Government of $18,764—about $10.40 a month per capita.

311 The number of acres contained within the Klamath Reservation is 1,056,000, and of these only about 20,000 acres are considered to be tillable land. The rest is occupied by woods, marshes, rocks, and other hindrances to cultivation.

797 The school and church interests are in the hands of the Methodist Episcopal Church, which also has a vote in the appointment of the United States agent.

657 161 162 The statistics of population have furnished reliable data only from the time when annuities were first distributed among these Indians. This necessitated an annual count of each family, giving the number of the individuals belonging to each. One of these was made during my presence on the reserve on October 30, 1877, before the winter supplies were dealt out to the tribe. The summary is as follows:

David Hill, chief, at Agency and on Williamson River	225
P'lú, head chief, at the bridge, Williamson River	122
Long John, chief	103
Jack, chief	92
Lílo, chief	23
Total	565

The census taken in the Sprague River Valley, Yáneks subagency, furnished the following figures, Klamath Lake Indians and Modocs being indiscriminately included:

Littlejohn, chief	14
Skóntchish, chief	18
Modoc Johnson, head chief	71
Ben, chief	61
Brown, chief	30
Total	194

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

161 The Snake Indians were not counted at that time, but were assumed
657 to have the same population as in 1876: 137. This gives a total of Indians
162 for the Reservation of 896. This count included about eight mixed bloods and seven Warm Spring Indians from the Des Chutes River. The boarding-school at the Klamath Agency then had eighteen pupils of both sexes.

The reports of the Indian Commissioner for 1880, 1881, 1882, 1883, and 1884 can not be fully relied on, since they give the same figures for *each* of these years with an unvarying total of 1,023 Indians—Klamaths, 707; Modocs, 151; Snake Indians, 165.

The report of 1888, Joseph Emery agent, gives 788 Klamath Lake and Modoc Indians and 145 Snake Indians, a total of 933 individuals.

Probably the most reliable data were furnished by the Indian census made in 1881 for the United States Census Bureau, from March to August:

	Klamaths.	Modocs.	Molale.	Snakes.	Totals.
Total of tribes on Reservation	676	122	55	165	1,018
Number of males	286	58	30	80	454
Number of females	390	64	25	85	564
Unmarried at fourteen years and upwards	109	6	9	11	135
Number married	286	55	14	65	420
Number of full bloods	664	122	53	165	1,004
Number of mixed bloods	12	....	2	....	14
Number below twenty-one years	291	58	35	89	473
Number above twenty-one years	385	64	20	76	545
Supported one half or more by civilized industries	36	6	7	....	49
Supported one-half or more by Government	38	3	....	2	43
Number wearing citizens' dress	630	112	55	165	962
Acres under cultivation	2,249	140	36	....	2,425
Number attending school	36	1	....	3	40

This enumeration is remarkable on account of the large number of Molale Indians mentioned in it, an element of the population which is nowhere else designated as such in the periodical reports made by the agents.

*657 *648 563 167 tunities of the reservation. As they moved away, they extended Indian experience into the midst of frontier society. During the allotment period they in turn enlarged reservation perspectives.

*657 *648 563 162 The majority of the interbreed children that appeared upon the early reservation, then, were the product of temporary or unstable unions and appeared as fatherless children. The annual reports are unrealistic as to their number. In 1885, for example, it was claimed that there were only 12 interbreeds in the total population of 919,[9] although to judge from later censuses, the number must have been several times as great.

*657 *648 563 [144] [848] [602] One of the long-range results of this intercourse was to reduce somewhat the difference in physical appearance that separated the Indians from the surrounding population. Another—and more immediate—consequence, however, was to raise the divisive issue of illegitimacy among the Indians themselves and to introduce into the tribal body individuals who could claim only maternal kinsmen. Thus, one Klamath recalls his father, a stage driver in Klamath Falls, as a drunkard whom his mother finally left. The family returned to his maternal grandparents, in whose care the boy grew up. His mother subsequently married a man who ran a logging camp at Pelican Bay, a hard worker and good hunter who treated the boy well. Nonetheless, throughout his life he bore an animus against his father and in part against the heritage he represented.[10]

*657 *648 563 162 [595] Interracial unions were encouraged, not only by a dearth of white women but by an early preponderance of women among the Klamath and by regulations which put an end to polygamy. The early imbalance between the sexes was striking. The figures supplied by Captain Kelly for the adult Klamath in 1864 give a sex ratio of no more than 0.47.[11] Those for the Link River band two years later areonly a little higher for the adults, 0.52, although the overall figure is 0.64, since boys and girls are in approximate balance.[12]

• [164] [847] Neither sex-linked disease nor the practice of selective infanticide is known to have occurred among the Klamath, and the most probable explanation must be sought among such factors as differential exposure to rigorous training, warfare, and vicissitudes of the food quest, as well as to possible emigration of single men. O. C. Applegate, the only Agent to comment upon the im-

measure of official sanction. "I have recently induced their chiefs 657*
and people," he reported, "to dispense with one half or more of 648*
their native doctors, each chief and his people selecting one to 756
retain. They came into this plan more readily than I had appre- 622
hended."[8] On a visit to the Agency, Lindsay Applegate came 178
upon the new system and, in a letter bristling with indignation, 177
wrote "[Nickerson] turned to me and remarked that they ware
his indian docters that he had invited the indians to furnish to
practice with his docter at the same time [.]"[9]

Meanwhile, the growing success of the medical program upon 657*
the reservation sapped the authority of the shamans in what was 648*
their last legitimate field. The personality of Dr. Royal, who had 756
doubled as chief of police, apparently did much to win over 164 •
some of the chiefs, as did his treatment of syphilitic cases among 177
the Indians. (Since, as Roork had remarked, the disease had been 178
contracted by Indians in the course of their annual trading trips
to Oregon City and other points,[10] it may have had a higher
incidence in chiefly families.) They desired to retain him and,
wrote Nickerson in advocating this, "Should he remain permanently the chiefs have agreed to do all they can to do away with
their Indian doctors. These Indian doctors have heretofore had
almost unbounded sway over the people."[11]

In outlawing shamanistic activities, the Agency in effect drove 657*
a wedge between the shaman and his ritual assistants: the inter- 648*
preter, caller, and singers. Since a curing seance was a public 756
demonstration, it involved too many participants to be concealed 177
easily; and the shamans, formerly among the most respected and 178
feared members of the tribe, were not given to skulking. More- [778]
over, in native theory, supernatural power waxes with use; and
when performances were no longer given frequently, that power
declined.

Recalled H. N.:

> I always seen David Hill go among the people and interpret the agent's words. Sally [the shaman] said, "I didn't do it myself, but my medicine do it. It's up to my medicine. If I do it, it's the medicine's fault." But David Hill said, "It's better for you to quit than to have trouble for yourself, or your family. That's what the agent wants."
>
> . . .
>
> Nobody ever called her after the orders were given. They might help minor things. I watched Sally. I watched her doctor.

Sparrow: Male, Age 63

Background Data

*159
[156] Sparrow's case is cited because of his position on the lowest rung of the local
status hierarchy. He is known as a happy-go-lucky, worthless old drunk and is
[872] generally considered as "lacking a few of his marbles." However, Sparrow is
seldom publicly disparaged, for local citizens simply pay little attention to
[161] him. He has a sixth grade education, gained at the Agency school. He has
apparently never worked consistently at any job, and most of his work experience
[434] has been as a farm or ranch laborer. He is and has for years been totally depen-
dent upon per capita income and the income from ranch lands owned by his mother,
with whom he lives. Their affairs are managed by a local businessman who some
years ago was appointed their guardian. He is the second eldest of four siblings.
After his father's death forty years ago, his mother remarried and bore two other
[586] children. He was married once when a young man, and after four years divorced
his wife because of "her shiftless ways." He is a semi-invalid, the result of
[164] an accident years ago when a drunken brother drove over him with a truck, crushing
[191] his pelvis. He speaks fluent Klamath, the result of constant association with
his aged mother who represents a direct link with the aboriginal Klamath past,
as well as adequate English, learned in school.

[233] Much of Sparrow's time is spent in jail for drunkenness, in the local tavern, with one of the drinking cliques, or passed out in a doorway. When he is not totally drunk he spends much of his time with his mother, for whom he cares in his fashion. Occasionally he goes fishing in a nearby river. For at least twenty five years, this has been the pattern of his activities.

*159 Sparrow has many skills, among the most striking of which is the ability to
154 "fly from here to the Agency without once touching the ground." There are
several dimensions to this delusion, one of which is an association, in Sparrow's thinking, with the acquisition of power. When a young man he dreamed of acquiring the power to "rise up off the ground, like Jesus Christ." While such a belief may have aboriginal correlates, there are no Klamath today who would accept it as valid. Sparrow keeps this secret to himself, and relates it only to strangers and transients from whom he intends to borrow money. His other skills include the following: the ability to keep house and cook, harness making, leather working, painting, canning food (the notion involves laying in stores for the winter), tanning buckskin, wood carving, carpentry, poetry composition (in Klamath), arrowhead making, making traditional basketry, stock raising, restaurant management, and finally, the ability to bewitch rich old white ladies, who are captivated by him and who drive him about in their white Cadillacs. The latter may be associated with a recurrent dream of meeting with a white buffalo, also a symbol of power, but it is difficult to say, for there were never any buffalo near the Klamath, and it is more likely that he has got this idea from reading western stories. Needless to say, most of these skills are quite delusional also. There is no evidence for any of them being more than this. Relating one or more of these is Sparrow's single style of interacting with others, for in reaction to a question or another's anecdote he will sift about in his memory until he comes up with one of his capacities which seems relevant. Very frequently, the writer could not see where or how they were appropriate, but for Sparrow there seemed to be some connection. He relates these matter of factly, with only the most slight suggestion that they were self-enhancing, and no indication that he meant to justify himself, and will then coyly watch his listener to see if he is properly impressed. This behavior tends to merge with Sparrow's

142 tall, and wiry, while the women are short and often incline to embonpoint. Nevertheless obesity is not more frequent there than it is with us. No better illustration of their bodily characteristics can be had than a collection of their personal names. These sketch the Indian in a striking and often an unenviable light, because they generally depict the extremes observed on certain individuals. The sex can not, or in a few instances only, [551] be inferred from the name of a person. We frequently meet with designations like "Large Stomach," "Big Belly," "Round Belly," "Sharp Nose," "Grizzly's Nose," "Spare-Built," "Grease," "Crooked Neck," "Conical Head," "Wide-Mouth," "Small-Eyes," "Squinter," "Large Eyes," "Half-blind," or with names referring to gait, to the carriage of the body, to habitual acts performed with hands or feet, to dress, and other accidental matters.

165 145 With all these deformities, and many others more difficult to detect, these Indians have bodies as well formed as those of the Anglo-American race, and in spite of their privations and exposure they live about as long as we do, though no Indian knows his or her age with any degree of accuracy. 164 A very common defect is the blindness of one eye, produced by the smudge of the lodge-fire, around which they pass the long winter evenings. 304 301 With the majority of the Indians the septum of the nose hangs down at adult age, for the nose of every Indian is pierced in early years, whether they afterwards wear the dentalium-shell in it or not.

000 Stephen Powers, who had good opportunities for comparing the Modocs with the tribes of Northern California, says of them:

> They present a finer physique than the lowland tribes of the Sacramento, taller and less pudgy, partly, no doubt, because they engage in the chase more than the latter. There is more rugged and stolid strength of feature than in the Shastika now living; cheek bones prominent; lips generally thick and sensual; noses straight as the Grecian, but depressed at the root and thick-walled; a dullish, heavy cast of feature; eyes frequently yellow where they should be white. They are true Indians in their stern immobility of countenance.*

Passing over to the psychic and mental qualities of these Oregonian natives, only a few characteristics can be pointed out by which they differ from the other Indians of North America. The Indian is more dependent

---

* Contributions to North Amer. Ethnology, III, 252, 253. By Shastika he means the Shasti Indians of middle Klamath River, California.

175 648 changed their settlements, as hunting nations are in the habit of doing. Thus Pauline Marsh, near Silver Lake, and Pauline Lake, on one of the head springs of Des Chutes River, were both named after the Snake chief Panaína of our Texts. The bands established upon the Reservation since the treaty was concluded are called Walpapi and Yahushkin. At first they ran off and committed depredations in the vicinity, whereupon the Government was compelled to force them back. General Crook made several expeditions in the execution of the task. These campaigns were short and decisive, and the Klamath Lake scouts engaged in them did good service, as evidenced by General Crook's reports[*] and Dave Hill's Text, pages 28–33. Upon the defeat and killing of Panaína, the Walpapi chief, the tribe finally quieted down and remained neutral in the commotion caused by the Modoc war of 1872–'73.

175 161 164 No indications are at hand of the number of Indians formerly inhabiting the headwaters of the Klamath River. Before the first census was taken estimates deserving no credence were made, varying from one thousand to two thousand Indians. In those times the scourges of small-pox, syphilis, and whisky did not inflict such terrible ravages as they do now among the Indians; but instead of these the continual tribal quarrels, family vengeance, the ordeals of witchcraft, dearth of food, and the inhuman treatment of the females must have claimed many more victims than at present. Emigration and intermarriages with other tribes were rather the exception than the rule, and are so even now. [563] [167]

THE TREATY OF 1864.

175 648 During the ten years following Wright's massacre the country began to assume a somewhat different aspect through the agricultural and stock-raising settlements of white people that sprung up in Lost River Valley, around Little Klamath Lake and in other places. The cession of lands to the "Oregon Central Military Road Company" from Eugene City, in Willámet Valley, through the Cascade range, across the Klamath Marsh, to

*648

*657 first encountered Christianity at the school. There were studies,
872 though the most lasting impressions were made in references to
[797] Indian wars in the histories.[21] Above all there was the heavy
[829] labor, for the development of the industrial program coincided
[464] with the period when able-bodied men were leaving the reservation on passes to work for whites; and the support not only of the schools but in some measure of other Agency programs devolved upon the scholars. As E. L. Applegate admitted, "the truth is, the labor is very heavy upon those old enough or intelligent enough to render any assistance; 110 people [in the school] constitute a large family."[22] Work on the school farm required the pupils to return in two-week shifts over the summer. A contest for control over this work force developed between Applegate and the Superintendent of the Agency school, who presumed to take his orders directly from the Superintendent of Indian Schools in Washington.[23]

*648
There was competition from off-reservation schools over the
*657 older students. In 1881, Nickerson, perhaps prodded from above,
871 had attempted to send twelve superior students to the Indian school at Forest Grove—later removed to Chemawa, Oregon—but funds were not available to send them the 450 miles distant.[24] In a letter from Acting Commissioner E. L. Stevens, the role of those schools and their competition with Agency schools are clearly acknowledged. Declared Stevens:

> It is not the policy of this office to remove pupils from reservation to distant boarding schools without the consent of their parents.
>
> It is always the case that the removal from agency schools of the older and more intelligent pupils is, temporarily at least, a detriment to the schools; but it is believed that the superior advantages which can be had away from the Indian country, and the reflex influence on the families who thus commit themselves to civilization, more than compensate to the tribe for the loss occasioned to the schools.[25]

*648 In 1885, accordingly, nineteen students were sent away to
*657 school, and by spring, five had died. Eventually eight were dead,
871 and Emery wrote, "This great mortality has caused much dis-
• 165 satisfaction among my Indians; and any effort to remove any more children to this School will meet with serious opposition on

876

In the education for a new life which the schools essayed to impart—and this, against all diversions, was its chief task—the caliber of the teaching staff was crucial. It is difficult to evaluate the accomplishments of the teachers, for some were relatives or longtime friends of the Agent; and the adverse criticisms of such men as Emery sometimes cloak differences in educational outlook. Scattered through the records are remarks on the lack of prior school or Indian service experience. In one staff evaluation appears a notation on Thomas Davis, industrial teacher, "recommended by Governor Penoyer as his nephew. He is learning and is prepared to do better in the future."[27] Of another, J. W. Brandenberg, superintendent and principal teacher at the Yainax school, it was observed, "He has maintained good discipline in this School, though his methods of punishment may have been considered a little severely by the Department; he having resorted to the shackles in extreme cases. . . ."[28] These are commendatory remarks. Brandenberg was later removed by order of the Commissioner.

An extreme instance was detailed by E. L. Applegate in charges against Col. H. B. Compson, the Superintendent of the Agency School. After describing the squalor of his residence, Applegate proceeds:

> As an example of the civilized White men, he could and did knock down his wife in the presence of the school girls while, at the same time, their daughter, the assistant matron, belabored him over the head with a wagon whip. The matron herself was an invalid, but of sufficient spite and vim; as to inflict scars on different parts of the bodies of school girls, and even upon their faces and heads."[29]

In the light of conflicts over educational and disciplinary practices and the frequent partisanship, it is not surprising that there should have been a high turnover of staff. The Superintendent of the Agency boarding school noted in 1892 that over the previous seven years there had been on the average a change in Superintendent every six months, and that there was marked insubordination among the scholars.[30] Eight years later, the

time, few years have not seen at least one murder upon the 648*
reservation. 657*

Lesser crimes have also been frequent. Of the 1958 sample 674
of the reservation population above the age of sixteen, no fewer
than forty-three per cent had been arrested for misdemeanor,
seventeen per cent for felony. Liquor had led to arrest for thirty- 648*
seven per cent, and no fewer than forty-nine per cent were 657*
judged to have problems associated with drinking. The corre- 273
sponding figures were slightly higher for those members living in [674]
Chiloquin, where opportunity, observation, and arresting officers
were all more frequent.

In situations in which other peoples have sought redress in
religious movements or covert sorcery, Klamath have more [154]
commonly fallen back upon drink and violence. For them the
bottle has proven a maladaptive instrument, as shown by a [165]
recent survey of the causes of death of 139 members who expired during a period of four and one-half years: drinking was adjudged to be a contributory factor in no fewer than fifty-seven per cent of the deaths.[9] The violence which often caps drinking bouts is likewise self-destructive: for it often strikes close friends or family members.

From the viewpoint of the city fathers, then, the Klamath have been an unruly segment of the citizenry; and the figures on law and order pose the difficulty confronting the community in the maintenance of an orderly life. Alternatively, however, those same figures represent a sizable income to be realized through the administration of the law. In the latter days of the reservation, as the Indians themselves were clearly aware,[10] the city seemed on the one hand to be profiting from the sale of beer and wine to tribal members and on the other to collect large fines from them when, under the influence of alcohol, they had fallen into the toils of the law. The implications of this policy, by which almost two-thirds of the income of the town was supplied, made many white citizens uneasy. The city fathers, concerned with a parsimonious administration, were not eager to seek a substitute and, indeed, any change would have presented obstacles.

So long as the tribal government remained to articulate their 648*

Weasel: Male, Age 29

Background Data

In contrast to all other subjects Weasel's role in the reservation community 159*
is a totally negative, destructive one, largely that of a supposedly vicious [156]
criminal. He was born and raised on an economically un-productive ranch, which
for twenty years or more has been the location of continuous drinking parties. [593]
Weasel was raised within a circle of a pack of older brothers, half-brothers,
and step brothers, all of whom were bigger, stronger, and more capable than he. [733]
His father has been an alcoholic for thirty years and has rarely worked or con-
tributed much to the organization of the family, which as a co-residential [592]
household usually included more than a dozen persons. In all, Weasel had 17 [165]●
full and part siblings, half of whom are now deceased, three directly as a re-
sult of drinking, three from acts of violence or car accidents.

Weasel's formal education ceased when he was 15, in the ninth grade, at which [871]
time he was arrested on a burglary charge. Since then he has spent six years [674]
in reformatories or penal institutions. He was tested while in jail on an
assault charge. Shortly thereafter he was found not-guilty, then re-arrested [697]
and sentenced on a different assault with a deadly weapon charge to three years
in the state penitentiary.

Weasel has repeatedly moved out of the circle of the family group, only to
fail "outside" and return to its sheltering arms. For a time Weasel was a [542]
professional boxer, but one without much skill or stamina. He never won a fight
and his face shows the evidence of the capabilities of his opponents. His
membership in this profession did not last long, and Weasel states, rather
proudly, that the Boxing Commission expelled him "For conduct unbecoming a
professional boxer." Weasel was once married (a common-law marriage, which [588]
for Weasel's primary reference groups is well sanctioned) but this lasted just [581]
16 weeks. During this period Weasel stayed sober, the longest time he has spent
without a drink since the age of 12. Weasel was consciously trying to reform [733]
himself, but now feels that he was a fool to ever try. Additionally, Weasel
has repeatedly made a circuit of nearby towns and cities either singly or in [156]
the company of a brother or friend. These visitations have more of the charac- [579]
ter of raids than anything else, and Weasel is usually arrested in one or a-
nother place and either charged or shipped out of town. [697]

In addition to being a minor criminal Weasel is frequently also the scapegoat 159*
for the aggressions of stronger men than he. He constantly asks for trouble, 156
but has never given any evidence that he can back of his threats with appro-
priate force. His successful acts of aggression have always been sneak attacks, [186]
or attacks on feeble old men or young boys. He seldom attempts to avoid the
consequences of these actions, and, indeed, is frequently not able to do so,
because of his extreme drunken condition. He seems to obtain some gratifica-
tion from the minor prestige afforded his performances in these roles, but this
gratification is highly personalized and is not recognized as appropriate by
others. It may be that he has been attempting to build up his standing and re-
putation within his own circle by acting out the role of a "dangerous Indian,"
but it would seem that he has been singularly unsuccessful in this. One aspect
of this behavior is his reputed skill with a knife. On two occasions he wanted
to obtain vocational training, once as a barber, the other time as a butcher,
both times implying that this would be a simple extension of his native talent.

142 tall, and wiry, while the women are short and often incline to embonpoint. Nevertheless obesity is not more frequent there than it is with us. No better illustration of their bodily characteristics can be had than a collection of their personal names. These sketch the Indian in a striking and often an unenviable light, because they generally depict the extremes observed on certain individuals. The sex can not, or in a few instances only,
[551] be inferred from the name of a person. We frequently meet with designations like "Large Stomach," "Big Belly," "Round Belly," "Sharp Nose," "Grizzly's Nose," "Spare-Built," "Grease," "Crooked Neck," "Conical Head," "Wide-Mouth," "Small-Eyes," "Squinter," "Large Eyes," "Half-blind," or with names referring to gait, to the carriage of the body, to habitual acts performed with hands or feet, to dress, and other accidental matters.

165 With all these deformities, and many others more difficult to detect,
145 these Indians have bodies as well formed as those of the Anglo-American race, and in spite of their privations and exposure they live about as long as we do, though no Indian knows his or her age with any degree of accu-
164 racy. A very common defect is the blindness of one eye, produced by the smudge of the lodge-fire, around which they pass the long winter evenings.
304 With the majority of the Indians the septum of the nose hangs down at
301 adult age, for the nose of every Indian is pierced in early years, whether they afterwards wear the dentalium-shell in it or not.

000 Stephen Powers, who had good opportunities for comparing the Modocs with the tribes of Northern California, says of them:

> They present a finer physique than the lowland tribes of the Sacramento, taller and less pudgy, partly, no doubt, because they engage in the chase more than the latter. There is more rugged and stolid strength of feature than in the Shastika now living; cheek bones prominent; lips generally thick and sensual; noses straight as the Grecian, but depressed at the root and thick-walled; a dullish, heavy cast of feature; eyes frequently yellow where they should be white. They are true Indians in their stern immobility of countenance.[*]

Passing over to the psychic and mental qualities of these Oregonian natives, only a few characteristics can be pointed out by which they differ from the other Indians of North America. The Indian is more dependent

---

[*] Contributions to North Amer. Ethnology, III, 252, 253. By Shastika he means the Shasti Indians of middle Klamath River, California.

*648 *657 to be released from service. As the Agent of that period, Linus M. Nickerson, summarized matters, his carpenter, wagon- and plowmaker, blacksmith, superintendent of farming, farmer, and sawyer lapsed, while the treaty provided for a five-year continuance of physician, miller, two teachers, and the materials for shops mills, and agency buildings.[8] The Bureau at this point assumed responsibility for continuance of some of the staff and thus resolved the crisis.[9]

*648 *657 871 Later exigencies led to further modifications of staff, until the superintendent of the Yainax boarding school became responsible, in effect, to the Agent for the entire administration of the upper end of the reservation; and the interpreter, doubling as blacksmith, oversaw the issuing of rations to Indian employees and the destitute, and supervised the working prisoners. As more men • [166] [464] left the reservation in the eighties and nineties in search of employment, the labor force available for reservation maintenance dwindled, and the Agent had recourse to the older school boys as part of his work force. Since they were to spend half the day under the industrial teacher, a struggle for ascendancy over this functionary developed between Agent and school supervisor, a battle which more than once was marked by acerbity.

So complicated was the issue by the growing centralization of the management of reservation schools under a district superintendent of Indian schools in Washington, that Agent Joseph Emery had to be reassured: ". . . the Indian Agent is [the Office's] representative upon the Indian reservation . . . [and] it is my intention to properly support your authority in all legitimate cases."[10] Another circumstance was the location of the Klamath boarding school under the direct surveillance of the Agent. While his counterpart at Yainax controlled both school and subagency, the Superintendent of the Agency school chafed under the levies—and at times the direct interference—of the Agent. This was particularly true during the tenure of Emery, a former professor at the Agricultural College at Corvallis, who instituted a number of innovations in the school. That friction did not result solely from the play of exceptional personalities is shown by the circumstance that later Agents, E. L. Applegate and David W. Matthews, encountered similar trouble.[11]

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*657 *648 592 162 and this corresponds fairly closely with averages from the listing of Upper End bands. Only the Link River tally is aberrant, with an average of about 20, far above the figure to be obtained from those Link River households included in the census of the tribe at large. Since the tally was made in September, it may reflect the open living conditions of that season.[21]

*657 *648 592 622 162 Household size ranges from 27 persons down to 2, the latter figure for the household of a widow. Households of known chiefs —taking as criterion a signatory to the treaty of 1864—are well above the average, ranging generally between 22 and 15, with only those of the Modoc, Schonchin, and the Paiute, Ocheho,[22] falling below. However, as will be seen, chiefly households were not the largest in absolute figures: those of some of their followers exceeded them. The large households indicated here [178] point to the continued presence of the extended family as a residential group.

*657 *648 592 162 By contrast, the census of Slabtown, a small settlement near the Agency occupied primarily by Agency employees in 1901, shows 13 households comprising house head, wife, and from three children down to none, with an average of 1.4. In one family a girl past school age, and in another a grown son, were among the children. In addition to those children at home, the families had others in school, in the same numerical range and with the same average. The total family size ranged from 2 to 8, with an average of 4.7. Because some of the family heads, perhaps all, were young at this time, family size may thus have been somewhat skewed.[23] Nonetheless, the contrast of these households comprising conjugal families with those occupied by extended families forty years earlier clearly demonstrates the residential fractionation of the larger units.

*657 *648 166 A seasonal mobility still characterized the Klamath family. Nickerson mentioned in 1884 that the heads of reservation families—from one-half to two-thirds of the men—had been away for the last four months, and added, "They generally take their families with them on such occasions."[24] Similarly, in a predecessor of Slabtown, over fifty families engaged in hauling logs on sleds to the sawmill camped in tents in January to be near their work.[25]

000 Of all the societal relationships, the government sought directly

TEN

[P.125]

The Changing Environs

THE ISOLATION OF THE RESERVATION HAD NEVER BEEN MORE THAN A relative condition. From early days the soldiers at Fort Klamath, the settlers on Wood River and the Upper Sprague, together with the growing towns of Linkville and Lakeview, made its seclusion far less than absolute. A policy that permitted the freighting runs to Jacksonville and Ashland or the pass system by which perhaps three-fourths of the men and their families were permitted to leave the reservation for as long as four months to work for whites: these greatly diminished the policy controls exercised by the Agent. 657* 648* [361] [166] [464]

In the period ahead, however, boundaries were to be further dissolved. In 1882 Nickerson could declare, "This reservation contains as many inhabitants to the square mile as Lake County or Eastern Oregon."[1] Homesteaders were even then filling up the land, and the rate accelerated as Linkville—become Klamath Falls—and Lakeview responded to the market and communication needs of the region. When the Southern Pacific railroad reached Klamath Falls in 1909, the resource relationships in the Klamath Basin changed radically. Reservation timber, previously of little commercial value, suddenly possessed great worth and the mills in Klamath Falls and neighboring communities soon became reliant upon it. The Oregon, Central, and Eastern railroad ran up the Sprague River Valley, while by 1911 the Southern Pacific had pushed north across the western face of the reservation to Kirk. In 1923 work was resumed on the latter line to complete the Natron Cutoff from the Willamette Valley; three years later it was completed. Thereafter, the Lower End lay on a main line. [161] [313]

Thus, to the cattlemen and sheepmen operating on the reservation under grazing leases were added railway gangs, then [563]

7

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*657 logging camps and mill towns. In 1930, at a time when the total
*648 enrollment of the tribe was some 1,250 persons, the predomi-
[563] nantly non-Indian population of one such reservation town,
[161] Chiloquin, and its environs was roughly 1,850, a figure which
placed it second in size in the entire county. Indian-white re-
lationships in such communities could no longer be adequately
regulated by the Agent. Moreover, improved means of communi-
[484] cation made it possible for an Indian to travel off the reservation
at will and thus beyond the reach of Agency authority. Most
[434] important of all, income from grazing leases, claims against the
government, and land and timber sales gave him the equality
of the marketplace.

*648 The maintenance of boundaries was justified in official corre-
*657 spondence of the eighties by the fate of those Indians who went
• 166 off the reservation. "Quite a number of the Indians," wrote
423 Emery, "obtain passes and go out to seek a living among the
whites. They usually camp in the suburbs of our little towns.
With few exceptions these Indians become thriftless vaga-
bonds. . . ."[3]

In 1884, Nickerson felt it necessary to counter the proposal of Judge W. S. Moore, of Linkville, that Sammy Andy, an Indian who had been working for Moore on pass, be allowed to locate permanently at Linkville and be released from the control of the U.S. Indian Agent.

> As there is no land that this man can secure as a homestead [he concluded], . . . [and] as I have no assurance that he has means sufficient to purchase a home suitable for his support, I do not approve of nor advise that the request be granted at present. Judge Moore has been very kind to this Indian, but should he die or move away, the Indian would be in a poor position to live, and would be subject to many serious temptations.[4]

The need for a general policy became apparent when several Modoc families who had never been on the reservation preempted homesteads in the Tule Basin. A reservation Indian, upon the advice of an attorney, likewise renounced his tribal relations and took up a homestead. "He has become deficient under his supposed citizenship," reported Nickerson, "and says he will not allow the Police to arrest him. . . . There is a white man

among them who is their counselor, . . . and who tells the 648*
Indians on the reservation that they can leave the reservation 657*
when they please."[5] Despite the contrary views of the U.S. 166•
District Attorney, two years later the Commissioner held that 423
any adult Indian or the head of a family was free to take a homestead on the public domain, and was further exempted from paying entry fees or commission.[6] When the General Allotment Act came into force next year, provision was made that nonreservation Indians might be allotted on the public domain.[7]

As reservation control weakened, there was an increase in the 648*
incidence of crime. Dyar had had to contend with "professional" 657*
gamblers in his day, with the prostitution of Indian women, and 694
with a few instances of bootlegging. When two Agency employees were killed in separate incidents little more than a month apart, the events had "had a very disheartening effect upon these [Indians] and many of them [were] for the time inclined to let go all holds and go back to their old customs."[8] Significantly one of those deaths, a shooting by a white sheepherder, occurred along the public road through the reservation.

Soon, across the reservation line on Wood River beyond Fort Klamath, saloons began to spring up. Nickerson stopped one man, a discharged soldier from Fort Klamath, and seized the liquor he was transporting to that oasis. He thereupon found himself facing extensive litigation, for the man had influential associates in Linkville. Before he was done with this and other cases arising from enforcement of the liquor regulations, the Agent was out of pocket nearly $1,000 in his own defense.

Although bootlegging, quarrels, and some shootings continued 648*
to involve whites, frictions began to develop with alien "half- 657*
breeds." The death of one of the employees slain in Dyar's time 674
was at first attributed to a "half-breed"; another was involved in 563
shooting up a saloon in the Wood River settlement; it was at least an outside Indian, a Pit River, who shot an Indian policeman at the Lost River fishery in 1883, and an interbreed who slew police lieutenant David Hill at the same place nine years later. An interbreed served as contact man for a saloonkeeper of the Wood River settlement, and another was accused of bootlegging in the nearby woods and at the autumn camps on Huckleberry

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

1870, demanding that whites living with Indian women and 657*
fathering children upon them be required to marry them or that 648*
the women be sent back and punished by law.[6] 563

The previous year, the Agent responsible for Indians in the vicinity of Jacksonville had reported a total of 60 Indians, 28 of them Klamath or Modoc, comprising Indian women living in casual unions with whites, together with their children. "The head quarters of the persons keeping these women," he continued, "is at Kanaka Flat about two (2) miles from this town.
At that point there is an establishment called a 'Dance House' [547]
where whiskey is sold and where women are plied with liquor and debauched in the most shameless manner." He advocated removing the women to their reservations, and this was subsequently done.[7]

As time went on, however, a small but growing number of stable marriages appeared in the areas fringing the reservation; and others, contracted about the same period, later came to light in more distant regions in the course of allotting tribal members.
One such marriage was that of the Kentuckian, Frank Riddle, 648*
and Winema, the Modoc heroine of the war between her people 657*
and the whites. To judge from Meacham, who in turn quotes an 563
informant—perhaps O. C. Applegate, who knew the family well 177
—Winema was an early advocate for the acceptance of the new ways she herself had adopted.

> "In the evening you would see the women and men gather around Wi-ne-ma while she told them of the wonderful things she had seen among the white people, of their manners and social customs; of the laws and rules of life; of their way of making law; making machinery, its uses, &c. For hours they would listen while she talked, and to her, much of the advancement of the Indians at Klamath and Yai-nax may be attributed."[8]

Clearly, along with other features there were qualities of self-enhancement in her new role.

Few mixed couples even tried to remain on the reservation. 657*
The official and lay attitude was disdainful of "squaw men," and 648*
they in turn must have been reluctant to subject themselves to 563
the minute regulations of Agency life and the limited economic 167 •
opportunities there. Too, they may have found the kinsmen of their wives both abundant and demanding. For their part, the wives may have been eager to reach beyond the limited oppor-

*657 tunities of the reservation. As they moved away, they extended
*648 Indian experience into the midst of frontier society. During the
563
• 167 allotment period they in turn enlarged reservation perspectives.

*657 The majority of the interbreed children that appeared upon
*648 the early reservation, then, were the product of temporary or
563 unstable unions and appeared as fatherless children. The annual
162 reports are unrealistic as to their number. In 1885, for example,
it was claimed that there were only 12 interbreeds in the total population of 919,[9] although to judge from later censuses, the number must have been several times as great.

*657 One of the long-range results of this intercourse was to reduce
*648 somewhat the difference in physical appearance that separated
563 the Indians from the surrounding population. Another—and more
[144] immediate—consequence, however, was to raise the divisive issue
[848] of illegitimacy among the Indians themselves and to introduce
[602] into the tribal body individuals who could claim only maternal
kinsmen. Thus, one Klamath recalls his father, a stage driver in Klamath Falls, as a drunkard whom his mother finally left. The family returned to his maternal grandparents, in whose care the boy grew up. His mother subsequently married a man who ran a logging camp at Pelican Bay, a hard worker and good hunter who treated the boy well. Nonetheless, throughout his life he bore an animus against his father and in part against the heritage he represented.[10]

*657 Interracial unions were encouraged, not only by a dearth of
*648 white women but by an early preponderance of women among
563 the Klamath and by regulations which put an end to polygamy.
162 The early imbalance between the sexes was striking. The figures
[595] supplied by Captain Kelly for the adult Klamath in 1864 give a
sex ratio of no more than 0.47.[11] Those for the Link River band two years later areonly a little higher for the adults, 0.52, although the overall figure is 0.64, since boys and girls are in approximate balance.[12]

[164] Neither sex-linked disease nor the practice of selective infanti-
[847] cide is known to have occurred among the Klamath, and the most
probable explanation must be sought among such factors as differential exposure to rigorous training, warfare, and vicissitudes of the food quest, as well as to possible emigration of single men. O. C. Applegate, the only Agent to comment upon the im-

[Klamath Reservation]

Family and School

648* 657* 602 178

WHITES AND KLAMATH ON THE RESERVATION RECOGNIZED IN FAMILY ties a bond that might be useful as well in formal enterprises. Several leading businesses in Chiloquin relied in part upon consanguinity and upon marital ties to recruit members and ensure continuity of control. Similarly, among the Klamath, during the bidding for tracts of tribal property in the course of termination, members characteristically acted in kin groups to undertake purchases that were beyond the resources of a single individual. In primary relations among both groups, visiting patterns and the occasional appearance of extended family households betokened the continued strength of ties reaching beyond the nuclear family.

[167] [563]

For the whites who had come originally from outside the reservation, kinship ties stretched to distant places and there were comparatively few relatives close at hand. Of the whites in Chiloquin in 1950, although fifty-six per cent had moved from a previous residence in Oregon, fewer than forty per cent came from the reservation, from Klamath Falls, or from southwestern Oregon. Only a handful had raised children and in turn had seen grandchildren being reared in the town.[1]

[587] [596]

The Klamath, with many kinsmen still upon the reservation, saw the network of relationship close at hand, however tangled it might be by the intricacies of remarriage. To be sure, the extended family as a residential group was not prominent, for in Chiloquin there were but two such households and in Beatty one. The strength of the bonds manifested themselves in other ways. Tribal residents in the city of Springfield, in the Willamette Valley, several of whom asserted that they had originally moved away to escape the importunities of kinsmen, had made the move as nuclear families over a period of several decades. None-

*648 off Chocktoot Street: to the postoffice to get the government
*657 allowance [sic!] of $600 a year; to the bank to get the cash; to
563 the iceman around the corner; to parts unknown; and then to the
181 justice of the peace."[6]

There were several reasons why the views concerning the
*648 Klamath should become increasingly invidious with time. Al-
*657 though they had come to adopt most of the outward trappings
563 of American culture, those who remained on the reservation often
181 displayed a style of life at variance with that of white neighbors,
571 until some of the latter came to see the differences as innate. In
• [[167] Chiloquin, the influx of southern whites after World War II was
said to have sharpened the stereotype: it seemed in fact to be maintained in less-qualified fashion among them. Antagonistic bias was least in evidence in Beatty, more strongly evinced in Chiloquin, and most apparent in Klamath Falls. Away from the reservation, Klamath tended to be absorbed in the larger category of American Indian, and to lose their special tribal identity.

*648 The impact of a felt discrimination was heightened for the
*657 Klamath by a sensitivity to slights in situations which whites
563 regarded as devoid of bias. Tribal members have been keenly
571 aware of the pairing of public equality and private bias. As one
elderly and highly respected Klamath matron in Chiloquin saw it:

> The Four Hundred are those who live among the Indians but feel that they are better than the Indian. The [poorer] people are more fussy. . . . They will talk to the Indians on the street and are friendly when they want business, but otherwise they don't know them.[7]

Indeed, intimate social intercourse has been discouraged by both sides. Comparison of the names of whites mentioning tribal members in a sociometric test conducted in Chiloquin with those included in a census of Klamath drinking cliques ten years later revealed that only a handful of individuals crossed the social boundary. From a general standpoint, Klamath and whites were virtually exclusive in their intimate associations. Those few whites who drank with Klamath and named Klamath among their friends were low in the esteem of their peers. Among tribal members, individuals who consorted regularly with whites thereby

Most Klamath live in one or another of the several
648 towns and settlements on the reservation, or else they have settled elsewhere,
361 in Portland, Salem, Eugene, in California, in Alaska, in the Midwest, or along
(167) the Atlantic seaboard. In 1955 the Tribe had 2118 members, and of these 40
percent lived away from the reservation (Stern & Swanson 1960). Partly because
[619] of the recent progress of the termination of federal supervision of the reservation,
by this date the percentage of members residing off the reservation has
[161] probably increased. In fact, for years there have been numerous "tribal members"
[619] with no experience whatsoever of reservation life.

648 Throughout the years of White contact inter-marriage and inter-breeding have
144 been frequent. Today, more than 70 percent of the Tribe's members are, genetically,
less than one-half "Indian," and less than one sixth are "full-bloods."
[171] Many are indistinguishable in appearance from their White neighbors, as most are
not easily distinguished in dress and language.

175 The isolation of the early reservation period was soon removed by the influx
177 of White settlers, who at first took up farms and started towns near the fringes
of the reservation. Through inter-marriage and through the consequences of
[361] allotment of land to individual Klamath, many Whites were soon residing within
the reservation's boundaries, either on the lands of a spouse, or on land bought
[423] or leased from tribal members. Another source of change were the ever present
efforts of Agency officials to make over aboriginal ways, and later, the rapid
[657] growth of the lumber industry and the development of full fledged frontier communities
were also important sources of acculturative influences. In quick
[726] succession the Klamath experienced a period of armed conflict (the Modoc War of
1872-73), a religious revivalistic movement such as that which swept the plains
[786] area, extensive governmental planning and intervention, the allotment of land
in severalty, and a growing participation in the cash economy. Because aboriginal
[181] Klamath values had stressed achieved status for those who worked to accumulate
wealth and property, for some Klamath the early period of contact provided increased
[556] opportunities, and there was a group of men who for a time were effective
entrepreneurs. It was through such personal efforts and through the "easy money"
[436] had from private sales or the leasing of agricultural lands, from pro rata shares
of boundary settlements, and from per capita payments for sales of tribal timber
that the Klamath made the transition to a money economy.

648 The participation in and contribution of the Klamath to the economy of the region
is a significant point of interchange between Klamath and White, and one with
[313] many ramifications. In considerable measure, the local timber industry prospers
[423] or slumps, depending on the allotted cut in the tribal forest. Similarly,
local merchants are somewhat dependent upon the assured income of tribal members,
[434] as they are upon the purchases of mill workers, fallers, and cat-skinners.
The major town on the reservation, Chiloquin, obtains the largest share of its
[632] revenue from sales at a municipally owned beer-hall and from the fines and forfeited
[251] bails paid by visitors to the city jail, both of which establishments are
patronized largely by Klamath.

648 In other aspects of community life the participation of Klamath is perhaps best
621 characterized as that of passive spectators. Many Klamath have come to have a
sense of being aliens in the heterogeneous local culture, although there is a
563 small assimilated minority.

[571] Thus Klamath may interact as equals in card rooms and pool hall, and are met
with a stereotyped "friendliness" in interactions in stores and on the street.
However, the great majority live in intimate interdependence separate from the
main currents of White social life. White ethnic exclusiveness is reflected

175 changed their settlements, as hunting nations are in the habit of doing.
648 Thus Pauline Marsh, near Silver Lake, and Pauline Lake, on one of the head springs of Des Chutes River, were both named after the Snake chief Panaína of our Texts. The bands established upon the Reservation since the treaty was concluded are called Walpapi and Yahushkin. At first they ran off and committed depredations in the vicinity, whereupon the Government was compelled to force them back. General Crook made several expeditions in the execution of the task. These campaigns were short and decisive, and the Klamath Lake scouts engaged in them did good service, as evidenced by General Crook's reports[*] and Dave Hill's Text, pages 28–33. Upon the defeat and killing of Panaína, the Walpapi chief, the tribe finally quieted down and remained neutral in the commotion caused by the Modoc war of 1872–'73.

175 No indications are at hand of the number of Indians formerly inhabit-
161 ing the headwaters of the Klamath River. Before the first census was
164 taken estimates deserving no credence were made, varying from one thousand to two thousand Indians. In those times the scourges of small-pox, syphilis, and whisky did not inflict such terrible ravages as they do now among the Indians; but instead of these the continual tribal quarrels, family vengeance, the ordeals of witchcraft, dearth of food, and the inhuman treatment of the females must have claimed many more victims than at
[563] present. Emigration and intermarriages with other tribes were rather the
[167] exception than the rule, and are so even now.

THE TREATY OF 1864.

175 During the ten years following Wright's massacre the country began
648 to assume a somewhat different aspect through the agricultural and stock-raising settlements of white people that sprung up in Lost River Valley, around Little Klamath Lake and in other places. The cession of lands to the "Oregon Central Military Road Company" from Eugene City, in Willámet Valley, through the Cascade range, across the Klamath Marsh, to

101 619 occupy, the names of which they bear; this, despite the lack of any sharp geographic division, rivers or ranges, such as we should expect to figure in political separatism. There are only three or four miles of open, unoccupied country between the middle Williamson river group and that at the river mouth, for instance, or between the latter and the northernmost outposts of the Klamath falls people about Modoc point. The cases of doubtful divisions really stress this point. Kowa'cdi on the lake shore may belong with the middle Williamson division; though only three miles away over a low range of hills, it is somewhat isolated. Similarly the Sprague river settlements toward Yainax, usually included in the same group, are in quite a different district.

721 619 [171] The third feature pointing to their separatism is the frequent feuds between them. It is quite clear that these involve the tribelets; they never occur between the settlements of a single division. The point will be clearer if we contrast Yurok sentiments. There feuds are between the towns or with only a group of kinsmen within a town, and at most when several towns are involved in a joint cause, it appears rather that kinsmen and their friends have been drawn in.[34] [567] Further, feuds are carried on much as warfare with foreigners; property is destroyed, women and children enslaved. Such slaves can be retained indefinitely or sold again. We may wonder however if they are not restored when a settlement is bought, or at most retained only to even the score in lives.

The identity of these groups resolves itself solely into such aspects of group consciousness. There is no political mechanism within the group. When it comes to war with outsiders, each group can act for itself, others may join if they wish. [621] At the other extreme, the towns are not sharply separated. A town is probably in large part a body of relatives, although not so clearly so that towns are exogamous. In short, the tribelet is a body with a community of interest which hardly extends to the Klamath as a whole.

115 197 184 Only one informant, Pat Kane, suggested dialectic and cultural differentiation. The dialect groupings he gave are purely geographic. He also assigned shamanistic tricks, medical practices, and games to the several divisions, which all other informants emphatically denied. I could observe no linguistic differences and Gatschet recorded none.

000 The subdivisions or tribelets are:

[34] Kroeber, Handbook, 49.

WARFARE AND FEUDS

721 Klamath warfare is deserving of the name in contrast to the conflicts of the northern Californian tribes. Raids are carried into foreign parts for plunder, slaves, and revenge, and received in turn. No single town or tribelet is alone concerned: warriors are drawn [171] from the Klamath at large. This is in marked contrast to the Yurok and their neighbors, e.g., whose foreign wars seem but an extension of the private quarrels that set town against town, and in which the large body of Yurok may remain neutral. Warfare is here not mere retaliation, murder for murder, but is engendered by patriotic motive and tangible benefits.

There can be little doubt that the Klamath attitude is due to their contact with tribes of warlike habit to the north and east. Raids from that direction had to be met and countered. The interesting circumstance is that the Pit river people were under a similar compulsion but apparently made no effort to cope with the raids by reciprocating. So far as I can learn they never ventured against the Klamath despite their equivalence or even superiority of numbers. The cause for the difference seems to be that the Klamath had reason to raid; slaves and [437] plunder were important to them. There was a market for these [231] articles at the Dalles with much-coveted horses to be had in return. The Achomawi had no such outlet. I would not underestimate the [619] difference in tribal solidarity, which may have been entirely lacking among the Achomawi, but the suggestion is that such solidarity may in this instance be a function of a common cause against a common enemy. The Klamath had their share of internecine warfare.

648 Besides the close bond with the Modoc, normally friendly relations are maintained with the Molala across the Cascades, the Wătă'nkni (Warm Springs people) of the Deschutes, and the Wishram-Wasco 648 at the Dalles. Warfare is directed toward all other directions. Raids are exchanged with the Shasta several days' journey down the Kla- 721 math river, the Upland Takelma on the Rogue river, and the Northern [231] Paiute (Snake) of the desert to the east. The Klamath fight the Kalapuya and take horses from the Warm Springs Indians.[88] Since horses were obtained by them, raids may be expected of the Ya'mŏkni two hundred or more miles away; northerners generically, but in this

---

[88] Gatschet, 1:18.

Women also accompany a war party according to one informant, 726
but this is denied by another. They cook or paddle; that is easily 562
understood, but I am inclined to believe that they actually participate
in conflict. Perhaps the solution is that they accompany feudists, but
do not go on extended raids into enemy territory. Some are said to
fight with the men, shouting and jumping about to add to the terrifying
effect of the surprise. Armed with short spears by preference,
they help to catch women and children and to slay the aged as they
run to hide.

Leaders of the party are appointed by the chief, usually men of 701
affluence and commonly his relatives. There may be four or five
leaders of a single large party. The qualities expected of them are
bravery, ability to maintain their good sense in the excitement, and
to go without sleep. Chiefs became such largely by the prestige of
successful leadership in battle.

The war party proceed well-nigh naked and afoot no matter what 726
the weather. It is of some interest that even after the advent of the
horse they prefer to go afoot. This is reminiscent of the Blackfoot, [231]
but in our case at least may indicate how recent is the acquisition of
the horse. My information suggests the second quarter of the last [171]
century for the coming of the horse, and the wars were over by about
1865. The raid against the Upland Takelma mentioned above was
undertaken afoot. But this is not really a case in point because it is
doubtful that there were then horse trails across these timbered mountains.
The introduction of the horse facilitated long-range raiding.
Gatschet's informant describes its use against the Pit river tribes
about 1848–50; even then it was a ride of three days and a night.[46]
Canoe travel was of little importance in any but expeditions within
their own territory. [501]

A warrior's armament includes bow, club, and sometimes spear, 726
with shield and body armor. Fighting is wholly individual; there is
no sort of battle array. After the first rush of a surprise attack, they 411
fight by preference from cover. No line of bowmen ever fights in the
open, nor do lancers make a concerted charge. The sinew-backed war
bow is a powerful short-range weapon.[47] Arrow shafts are wooden,
the heads of stone loosely affixed so as to remain in the wound when

---

[46] *Op. cit.*, 1:19–27.

[47] Frémont observed that in 1846 he saw Indians behind the bushes with their arrows spread fan-wise so as to be ready at hand (Memoirs, 494).

411 the shaft is withdrawn. The tips are not poisoned.[48] However they
726 believe that those made of obsidian obtained on a mountain west of
Klamath lake are poisonous. A tale has it that an Upland Takelma
[539] shot a presumably mythical man, called Tcewis hu'lūms (alighting
flicker), there. Crow laughed and he turned into the pillar of rock
still standing. This is presumably the widely known tale of the shattered
701 rock-monster. A war leader, a rich man, carries several quivers;
one under each arm and a third across his back. The short stabbing
411 lance is stone headed; the club simply a straight stick or one bearing
714 a knot for a head. Armor is the familiar long skin tunic and wooden
slat armor of waistcoat shape. The round hand shield is used, but not
the curtain shield, i.e., a skin hung before the body. Sock-like skin
gloves sometimes protect the forearms.

It is planned to arrive in enemy territory at the end of the day.
726 Several good runners are sent forward as scouts (gau'ulū'kdja) to
[191] look for smoke from enemy fires. Scouts do not use animal cries like
those of the Northern Paiute. The camps are surprised at dawn, for,
(171) in addition to the confusion, there is the advantage of a long day in
which to make good an escape. Yet the fight may last several days, I
was told, but it is more likely that the raiders withdraw at once unless
beset by a rallied foe. One thing sets off the intensity of this conflict
from that of the Arizona Havasupai as I found it; there never occurs
here the gesture of bravado of drawing off for refreshment before
[554] returning to the attack. Yet there is something formal about these
fights too; the leaders make a point of engaging with men of like rank
in the forefront of battle, although they do not disdain lesser men.
Warriors do not pat the mouth as they charge (go'lgi); this is done
727 only in the scalp dance. The foray usually ends with the fleeing of the
ablebodied among the enemy, the killing of the infirm, and the capture
of women, children, and such property as beads and quivers.

(114) These are kept by their captors; perhaps some division of the spoil
is made. Disputes are inevitable; Gatschet's informant describes how
he wantonly shot down a girl whom he claimed as his due rather than
let another have her.[49] Pat Kane told me that all the booty is carried
to the principal chief who asks for an accounting of the dead and
slaves. The leader enumerates how each man took slaves or scalps and
how the opposing chiefs were killed. The trophies of these chiefs are
exhibited. I doubt his statement, unless he had in mind the prestige

---

[48] Gatschet's informant credits the Modoc with poisoned arrows (*op. cit.*, 1:90).

[49] *Op. cit.*, 1:23.

peculiar to the chief Lxle'ks, to whom they were accustomed to trade their slaves for transportation to the north. On the other hand this may be a reflection of the Plains custom of reciting coups. 727

Scalps are of liberal size, including the whole skin above the ears and brows, as is generally the case among western Indians. Bodies are dismembered for trophies; hands, feet, ears, heart, the lips cut away as one piece, genitals, and the whole head. (One informant denied that the head is taken entire.) Trophies are never taken from women nor from any men except leaders, the best fighters. There may then be some truth in the statement of Gatschet's informant that they disdained scalping Pit river people.[60] Kroeber has pointed out that the northwestern Californians as far east as the Shasta neither scalp nor hold a victory (scalp) dance.[61] Klamath practice is in accord with more general custom. [114] [171]

The scalp dance (sa'tca) is one of rejoicing over vengeance achieved. Hence the invitation issues from a relative of the avenged, not of necessity from a chief. Dancing begins immediately on the return of the war party and lasts two to five nights depending on the size of the group that collects. A minor raid is of course a matter of only local concern, but an affair of consequence brings everyone to a celebration for the full five days dictated by tribal pattern. Gatschet's informant recounted how on one occasion they made their captives dance before them at the first camp on their homeward journey.[62] 727 535

Older people of both sexes take part in the dance as well as the returned warriors. The young are barred and children especially must be kept at a distance. Quiet, decorous conduct is expected of those who do not dance, else they would be shot, for at this time the dancers are violent. Faces are painted white or red; hair is tied as for the war dance. They fast or at least eat no meat nor fish. This is the taboo that the Klamath impose during every crisis. There is no special purification for those who have slain an enemy.

The dance takes place in an open place, the very one on which the war dance was held, according to one informant. A huge fire is kept burning at the middle, where captured bows and quivers hang on a pole. The captives are huddled at its base, the older ones with their wrists tied before them.

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

Comparison with the record of white performances places the 648* tribal picture in perspective. In Beatty, six out of seven white 657* househeads were employed. A sample taken in 1950 including 464 almost every white household in Chiloquin showed that all the 162 men save those who were ill or retired were gainfully employed, 171 • and that in thirty-seven per cent of the households wives or junior members also held jobs.

By this token, the Klamath had come to occupy a marginal 648* position as economic producers. That this had not always been 657* true is shown by the record of those who in the early days of 464 Chiloquin had tried their hand at business; and several continued 437 to maintain themselves by ranching or business. The large majority of the men, however, were content to labor seasonally as unskilled farmhands. The undependability of some workers had generated an adverse reputation among potential employers for the Klamath as a whole. The industrious Klamath came to be viewed as exceptional.

Thus, even on their own reservation, the Klamath stood beneath the shadow of economic structures dominated by whites. This condition was, of course, true for the reservation as a unit; for distant interests dictated that it should be devoted to the production of lumber, beef, power, and to communications. Within the several communities the major enterprises were also controlled by whites. To be sure, there were checks upon the ruthless exercise of economic power. Local awareness of inter- [623] dependence, the intimate acquaintance developed in the daily life of a small community, and the knowledge that the tribal council controlled the fate of timber contracts upon which the community depended: all these served to temper purely economic decisions. The exercise of a credit system by storekeepers [452] in the face of lower prices in Klamath Falls, the good faith they expected of their customers, and the occasional need for hired hands by ranchers, were equally conducive to restraint.

Klamath families who chose to farm were often similar to their [241] white counterparts in the concentration which they devoted to their farming; and they often exchanged labor or equipment with white neighbors. There were few successful farmers among tribal members, perhaps no more than a dozen in all. By contrast, [233] there were those in the countryside who chose to follow other time-honored values than industry, giving precedence to per-

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 *657 563 where after attending public school or the Catholic academy, she took special training or found a job. About that time she met her future husband, a white employed as a laborer in logging, millwork, or construction. Evidently, he then stood below her in socioeconomic status, although in a superior ethnic bracket. The subsequent advance of the husband, after their marriage, may be regarded in no small degree as the result of her own drive and ambition as well as his. Such couples rarely returned to the reservation; and their life together was undoubtedly an extension of that first step, before they met, which had taken her away from the reservation.

ACCULTURATION

*648 *657 177 [171] [434] The suggestion has recently been made for the Ojibway that the sociocultural position they now maintain on their reservation in Wisconsin represents an accommodation to the standards of living of lower status whites.[11] At Klamath, the circumstances that might have reduced tribal members to a similar economic condition have been offset by income from leases and from tribal timber. The question may still be posed, however: to what degree does Klamath life on the reservation represent the direct acculturative influence of those whites, particularly of lower-class status, whom they most closely approximate?

The historical record, already reviewed, shows clearly that many early contacts of a persistent character were with whites whom Agents with some justification regarded as outcasts or renegades from their own society; but, their influence although it was undoubtedly felt, did not compare with the broader programs of the official staff, directed at the whole Klamath population and implemented through influential leaders. A few individuals such as Frank Riddle stand out; but their own ties tended to be with administrators like Oliver Applegate. The major individuals to offer opposing counsel were former Agency employees or individuals of substance in neighboring towns. Klamath recognized the tokens of success, and were unlikely to follow persons who showed every evidence of failure in their own lives.

There is some warrant for seeing in the Klamath situation a structural convergence. On the one hand, the skills and roles acquired by Klamath in the early days of the reservation during

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

EFFECT OF TERMINATION

After some ninety years of existence, the federal government 648*
brought to an end the Klamath Indian reservation. At Menom- 657*
inee, which was terminated at the same time, the reservation 619
became a county and the tribal body, converted into a corpora- [171] •
tion, was to continue the management of tribal timber and other assets.[25] The decision at Klamath was otherwise. With the closing of the tribal rolls, there was no longer succession to membership in the Klamath Tribe; and although the body of remaining members under trust was to be designated by the same title, it also had a closed membership and—if its members did not elect to end it sooner—would expire with the death of the last of the individuals who had entered it at termination.

The movement for termination of Indian tribes formed part 000
of a broad revolt against the philosophy of the New Deal, a movement which gained strength in the latter years of the Truman administration and reached full power in the first years of the Eisenhower presidency. In a campaign directed against what was conceived to be an encroaching statism, it was seen as repugnant for the Bureau of Indian Affairs to maintain an indefinite paternalistic supervision over the lives of a racial segment of the American citizenry. By some, the Indian Reorganization Act of 1934 was reckoned a misguided effort to maintain an existence for Indians separate from the main currents of American life. The view drew adherents from those who saw in reservations, as in national parks and forests, bureaucratic restraint of free enterprise. They hailed an administration pledged at once to give greater opportunity to the Indians and to a "businesslike" conduct of government that would prune unnecessary waste from the management of national affairs.

Clearly, the decision to alter the status of the Klamath was 648*
not an isolated one—witness House Concurrent Resolution 108 657*
of the 83rd Congress—and the solution that was proposed, the 619
devolution of responsibility to local agencies, formed part of a national shift in policy.[26] One must add that the Klamath had long been among the tribes considered particularly eligible for release from federal supervision. Yet it is clear, and the details have been related elsewhere,[27] that under legislative pressure

EIGHTEEN

[P.259]

Conclusion

THE ADMINISTRATION OF THE KLAMATH TRIBE UNDER THE PROVISIONS 648*
of the Treaty of 1864 comprised a program of directed change, 657*
paralleling in its general features the relationships of the United 171 •
States government with diverse other Indian peoples. Because a common policy lay behind the administration of Indian affairs, the history that unfolded at Klamath was similar at many points to developments on other reservations. Since, however, unique characteristics of Klamath culture entered into the equation, and common events were locally mediated, that policy had different effects in execution.

Within the spectrum of American Indian cultures, it was im- 648*
portant that the tribes brought upon the Klamath reservation 657*
were unacquainted with agriculture, but had some knowledge of, 241
and esteem for horse-herding; that while they lacked traditions 233
of large-scale political organization, they placed a premium upon 619
industry and the acquisition of material wealth. These attributes, 181
while by no means unique, were distinctive in their combination; 177
and they gain significance when seen from the perspective of 178
the policy objectives of the government. Similarly, the circumstance that many individuals had already undergone extensive acculturation beyond the Klamath country provided the early Agents with native allies already won over to the prospects of change.

Even the application of a common policy exhibited special 648*
features. Two instances should illustrate the point. The recogni- 657*
tion of the tribal claim to a large domain, together with the [423]
retention of surplus lands after allotment, laid the basis for a [619]
corporate wealth equaled by only a few other reservation peoples. [434]
Later, the rejection of the Indian Reorganization Act during the Collier administration placed the Klamath among a minority of

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10.

[Klamath Reservation]

the "dependent domestic nations" of Justice Marshall's famous 648*
decision. Many Klamath, now that they possessed funds to secure 657*
their material desires, lost incentive to strive. Lacking oppor- 177
tunities for training in competence except that offered in youth [434]
at school or—peripherally—in tribal government, many proceeded to demonstrate their unfitness to handle their own affairs. Spicer[5] [171] •
has noted how reservations in the Southwest suffered from being isolated economically from the surrounding regions. This was less the case at Klamath: in the timber exploitation, the reservation was all too closely identified with the dominant needs of the Klamath Basin and the West Coast, to say nothing of the nation at large. Instead, the ultimate needs of the Klamath had dropped out of the calculations.

In a recent analysis of the assimilation of minority groups in 000
American society,[6] Gordon identifies with the major society dimensions of integration which he designates as cultural, structural, marital, and identificational. In his view, cultural assimilation in visible externals is likely to take place first, probably in conjunction with entrance into formal, secondary relationships. Not, however, until members pass into those intimate social relationships termed primary with members of the host society have they achieved a crucial stage in assimilation. Thereafter, Gordon assumes that marital, then identificational, assimilation will follow with time.

Klamath may demur that they do not wish to submerge their 648*
identity through assimilation with Americans, but at least they 657*
have long sought parity. At first through their own efforts, then 177
later through their dividends from timber, they have acquired many of the attributes that are to be equated with Gordon's cultural category. Assimilated at this level, they have failed to be received at their own appraisal into the social system. Geertz[7] has postulated a model of change involving a cumulative imbalance between social and cultural dimensions which may have partial applicability here, for the Klamath have felt keenly the lag in admission to social relationships of which cultural properties already acquired form the symbols.

Caught in limbo, the Klamath have reacted in diverse ways, many of them characteristically individual and indirect. Some have evaded the situation by moving from under reservation

*648 surveillance; they have then had to make their peace in another
*657 community. In other instances, measures—for example, early
177 sawmills, drought cattle, loan funds—designed by the adminis-
tration to be instrumental in helping the Indians to attain distant goals of betterment, were diverted by tribal recipients to provide short-range benefits. Such action, present even in early times, became more pronounced as disillusionment set in; and organized forms of opposition were also added. In a formal character, there
[619] was an insistence upon the prerogatives that marked tribal
identity. Hence the highly emotional attachment to treaty rights, in however altered form hunting and fishing may be exploited; to the tribal government, however criticized its incumbents; and to the self-preserving myth of the past.

*648 There is, however, another side to the Klamath reaction which
*657 is to be seen in the anomic aspects of the life of Intermediate and
177 Inframodal segments of those dwelling in Chiloquin—although
182 this behavior was not limited to that city. Within Chiloquin,
184 those persons manifest many of the traits that Leighton terms
156 disintegrative: a high frequency of broken homes, of hostility,
crime, and delinquency; weak development of associations, recreation, communication, and leadership.[8] For the community as a whole, their effect is accurately characterized by his term. At the same time, their behavior had acquired such substantial predictability that the city fathers had come to rely upon it in the form of revenues from the municipal tavern and fines and trusty labor, for a considerable portion of the municipal budget. Under these circumstances, one might fairly say that a stabilized cultural pluralism existed.

*648 A situation like this cannot fail to leave psychological marks,
*657 and indeed Clifton,[9] observing that "there is very little evidence
177 to suggest, unequivocally, that guarded restraint was a dominant
156 component of aboriginal character structure," considers that
attribute to be largely a reaction to the complex unpredictabilities of the reservation. Indeed, the Klamath reaction has striking
[171] parallels in the "hostile dependence" of the Sioux[10] and the
"valuation group alienation" of the Aleut;[11] and it bears close resemblance to the situation described for the Ojibway by James,[12] who sees the personality traits he analyzes to have their source in the immediate context of white-Ojibway relations.

Those same traits others[13] had held to be conservatively Ojibway; 648*
and marking their counterparts among Menominee and other 657*
peoples the Spindlers[14] propose to see in them a common survival 177
of psychological characteristics shared widely by American Indians. 156
Underhill,[15] by contrast, accounts for the commonalty by 171 •
reference, like James, to experience in a shared situation, the reservation.

These differences of interpretation are by no means irreconcilable. The writer would agree with James[16] that "the genesis of [114]
the modern Indian self lies in the social processes that constitute reservation life," but he would include among those processes such relationships as may have survived in the peculiar cultural
environment furnished by the reservation.[17] Favored in persis- 648*
tence at Klamath have been generalized characteristics, rather 657*
than complex and specific traits. They have survived in part 156
because they are inculcated during childhood;[18] and the family, 177
within which child-rearing takes place, is one of the structures 178
that has retained distinctive qualities. They are sustained in the [571]
quality of primary relationships and are rooted in the individual, often at an unconscious level.[19] As Spencer observes, "The diffuseness of the social structure may be regarded as a survival from the heritage of the past, while individual activity continues to be couched in essentially aboriginal terms."[20] Reservation existence has provided, however, an ever changing context—albeit somewhat sheltered from the rapidly changing environs—in response to which enduring features have undergone modification.

To take the quality of guarded restraint, which Clifton regards 648*
as characteristic of the personality configuration of modern Kla- 657*
math, one can indeed trace continuities with the past. In the 156
myths there are present themes of watchful waiting and the use 177
of subterfuge in dealing with strangers and foes, and a wary 178
reserve in conflict with affinals.[21] In traditional relationships, as 571
Spencer has shown, sub-rosa patterns of aggression characterized [538]
"hostility . . . driven underground" by public disapproval.[22] That covert revenge has persisted is evidenced by historic records of several murders, of such acts as the firing of a haystack in 1897, attributed by the victim in part to the perpetrators' "envy of his prosperity . . .";[23] and to modern incidents of the same nature. Today jealousy is frequently attributed to unspecified others,

*648 usually Klamath by inference and to be identified only in part
*657 with feuding groups. It may well be that such a projection is an
156 indication in many modern Klamath of an alienation from their
177 own membership group. More central to the issue taken here,
178 however, is the probability that under the tensions of reservation
571 life guarded restraint, once restricted to a few role relationships,
has become generalized to a much broader range of contexts, while at the same time it has grown to be a pervasive characteristic of Klamath personality.

*648 The modern situation at Klamath, with its measure of human
*657 disengagement, apathy, and generated hostility, may be inter-
156 preted by some as justification for the abolition of the reservation
177 there and as an indictment of reservations everywhere. Such
178 conclusions are likely to be far too sweeping. The Klamath situation was a consequence of a reservation become a holding operation, with a program that had ground to a halt. Ironically, termination of the reservation was founded upon the premise that the Klamath had attained a successful level of integration with their white neighbors. It may not be concluded that problems have automatically been solved by the action taken; nor may it be maintained that other, less drastic steps, if taken in time, might not have proved more effective.

*648 For many Indian peoples reservations are a highly significant
*657 reality, constituting the only familiar homeland, the major con-
171 tinuity with the past, the sole real property, and the principal token of the government's resolution to honor pledges made long ago. At the same time, chosen with an eye to native exploitation or to the needs of the small farm of the nineteenth century, they are often unfitted to support a population by current standards. They thus pose the dilemma embodied in schemes on the one hand for local development and on the other for the relocation of Indian families. Sweeping measures are inappropriate; each reservation merits consideration in its own terms. Yet it would be shortsighted to seek only for material advancement, essential though this is; for, as the Klamath instance shows, unless the program give men hope, they languish even in prosperity.

M K 343 plunges into the lake or a pool in the river or whatever water there may be at hand. This practice seems to have been medicinal. It was used as a habitual means of warding off disease as well as of curing it.

The second form of sweathouse was of similar size and construction except that it had a saddle roof which was covered with several inches of earth instead of a dome-shaped roof covered with matting. The door of this structure was placed at one end and was usually quite small. It was closed by a blanket or tule mat during the sweating.

There was no large "sweathouse" used for ceremonial purposes as in the Coast Range and Sierra Nevada region to the south. All ceremonies were held out of doors, chiefly in the summer.

IMPLEMENTS OF WAR.[5]

M K 411 The influence of the unusual environment in which the Klamath and Modoc live is also very noticeable in the implements made and used by them, particularly in the various devices for the capture of fish and water birds.

The chief implements of war were the bow and arrow and a [171] rather short javelin. The war bow was of the general type of the northwestern part of California, having a sinew back and sharply upcurved ends. The arrow was made in the ordinary manner, with light wood or cane shaft, hard wood foreshaft, and a moderately large obsidian, or sometimes flint, point.

The javelin or spear was fairly short. Its shaft was made of heavy wood. Its point, usually of obsidian, varied from two to [178] six inches in length. These javelins, like war bows and arrows, [756] are no longer in existence, though the obsidian heads are quite plentiful about old village and camp sites. They are now used [525] by medicine-men in doctoring, and also by gamblers, who place them under the large mats used for gambling to insure good luck, especially in the game called sakalis.

HUNTING IMPLEMENTS.

M K 224 The implements used in hunting animals were usually the bow and arrow. Ensnaring animals was little practiced by the

---

[5] The Klamath names of the various implements, etc., here described are given by Gatschet in his dictionary, *op. cit.*

5: Barrett E-5 (1907) 1910
NR10 Klamath NR10
Modoc NS17

M place to place, a tule raft was sometimes used, particularly by
K war parties. Several large bundles of tule, sometimes two feet
501 in diameter and eight or ten, or even fifteen feet in length, were
[726] lashed together to form a raft. It is said to have been propelled
by lying down along the edges and really swimming the raft by
dipping the hands into the water with a motion similar to that
used in paddling.

M One of the most characteristic features of the culture of the
K region is the flat triangular platter made of tule and used for
serving food, particularly broiled or otherwise cooked fish and
285 roasted meat. Such trays are shown in pl. 13, figs. 1, 4, 6, and
415 vary greatly in size. Circular baskets of coarse tule, such as that
[262] in fig. 3 of the same plate, are more rarely found. Occasionally
they are bound about the rim with a hoop. More or less flat trays
of several other forms are also used. One such tray is shown in
fig. 5 of the same plate.

M Though not used at the present time, a tule sack was formerly
K made for the transportation and storage of wokas. This sack
was made of unsplit tule, but was of sufficiently close weave to
285 prevent the wokas from running through. These sacks were
415 sometimes made so large that when filled with the wokas seed,
222 which is comparatively light in weight, they were so heavy that
a man of ordinary strength, or a woman, would not attempt to
carry more than one at a time.

M There are several forms of rigid baskets made with willow or
other sticks, particularly the conical burden basket (pl. 16, fig. 3)
K which was used largely in gathering foods such as wild plums;
285 and the flat, more or less triangular, openwork basket with a
handle (pl. 16, figs. 1 and 2),[13] used as a sieve and as a grater as
[171] well as a general receptacle. In the loop handle this basket
differs from most of those of similar form found in various parts
of California. It is used for sifting the wokas after drying, the
seeds passing through the interstices of the basket, and separating
from the larger fragments of the pods. Also camass, ipos, and
other roots and tubers are rubbed on this basket in order to grate
off or scrape off the skin of the tuber. In addition to being made of
round willow stems, these baskets are also made of the split roots

---

5: Barrett E-5 (1907) 1910
NR10 Klamath NR10 ●
Modoc. NS17

M
fish basket, and one or two others. Twining is the only technique K
used, all coiled baskets coming from this region being extraneous
to the true native culture. The majority of the conical burden 285
baskets made of willow or hazel which are in use among the [139]
Klamath are made by themselves, though they do purchase from
the Shasta to the southwest a burden basket which is more nicely
finished than their own. M

K
Together with this very specialized tule culture, resulting 105
from the life of the people upon the immediate lake shore, go 22
water foods, particularly wokas and fish, and the special imple- 415
ments devoted to the gathering of the wokas and to the capture
of various animals, birds, and fish. Such for instance are the [133]
peculiar duck arrow, the large dip-net, the net used at night in [184]
connection with a light in the canoe for catching ducks and other [501]
water birds, the many-pointed fish spear, the two forms of bone
hooks, the dug-out canoe, and the forked pole for propelling it
in shallow water. The peculiar stone implements, such as the [276]
two-horned muller, L-shaped and discoidal pipes, and triangular
net-sinker, are also noteworthy.

The specialization of culture in this region is very striking M
indeed when it is compared with the culture of surrounding K
peoples, as for instance, the Paiute to the east, where coiled
basketry predominates and tule work is almost unknown, and 105
with that of the Indians of the Upper Columbia river region to 101
the north, whose culture was very largely influenced by the 171 ●
buffalo or plains Indian culture. A comparison with the Oregon Indians is difficult not only because the Oregon cultures are comparatively little known, but because the majority of Oregon Indians, owing to their habitat, showed either a coast or a desert culture, which is not readily comparable with the inland lake environment and culture of the Klamath and Modoc. The Indians in certain respects most similar to the Lutuami in culture lived down the Klamath river in the northwestern part of California. Here are found such things as the stone maul and the large triangular fish net. Here also the basketry is entirely twined and in a large measure of comparatively soft materials; and the willow or hazel burden baskets are very similar in their general appearance, form, and particularly in the border finish.

5: Barrett E-5 (1907) 1910

Modoc NS17

M
K
101
105
171

Dug-out canoes, though of a somewhat different form, are also made in northwestern California, and in general the art of working wood is well developed there. In fact, it is so well developed that the most characteristic wooden implements of northwestern California are not paralleled among the Klamath and Modoc or any of the California Indians. The Klamath and Modoc also have the earth house and the tule mat house, the tule raft, and the tule moccasin, and they also burn the dead, in all which respects they differ from the Indians of northwestern California. In these respects they agree with the Indians of a large part of the great Central California culture area, sometimes more closely with peoples that are near-by, such as the adjacent Achomawi, sometimes, especially in single characteristics, with those more distant. On the whole, however, the Lutuami must be placed in a class by themselves, at least as regards their material culture, with their specialized tule and stone objects, and implements for use on the water, and their characteristic foods. In large part this specialization is the outcome of habitat in a restricted and unusual environment of large, shallow, inland lakes.

[p.261 is blank]

Because it is for several reasons considered important, the fact that each 125
Klamath subject was, in general terms, made aware of the intentions of the 123
examiner and the logic of the test procedure should be emphasized. Recently,
Hauck has described a different approach used for research among the Unitah- 125
Ouray Ute, where he modified the usual Rorschach procedure by concealing the 114
purposes of the test beneath a supposedly innocuous "cover story" (Hauck 1955: 10).

This approach to field testing is subject to criticism on several grounds. In 125
the first place, it is somewhat less than ethical to conceal the purposes of a 123
test so as to facilitate cooperation, and then to publish results in line with (114)
original intentions. Occasionally, this approach has been used in culture and personality research. It entails the assumption of a kind of mechanical meaningfulness of any responses to projective tests, however administered, and whatever the test taking attitude of the subject. At a minimum, the subject has the right of knowing what he is involved in and the privilege of refusing. Secondly, where clinical methods of interpretation are to be employed, it is essential that field research using projective tests as closely as possible approximate the clinical situation. This assumes that the cooperating research subject is more apt to reveal important aspects of himself if he clearly understands the
intentions of the examiner. Indeed, one purpose of projective testing is to 12
facilitate communication about difficult topics, not to unduly impede it with artificial barriers.

Another aspect of this issue is that most American Indian populations include 12
some members with higher education, or, like the Klamath, others with some 177
awareness of the "ink-blot" or the "picture" test via spectatorship in the mass (171)
media. Because of this awareness, any subterfuge or concealment of test objectives may be publically revealed and further distorted. The consequence of this can only be a confused or negative appraisal of field research and field researchers. Given the existing wariness and suspicion of many American Indian populations and their concern with their status as "Guinea Pigs," such an outcome is not very desirable. Finally, it is quite conceivable that another field worker might want to pursue similar research in a situation where the purposes of a test have been concealed. If so, he will have to support the original lie, either by accepting it or by expanding upon it.

Quite frequently, the success of field research in the area of culture and 12
personality studies turns upon obtaining an adequate sampling of a population in a very limited period of time. Perhaps, as is suggested by the extensive sampling of Hallewell and the Spindlers in repeated field sessions, it is the time factor which is crucial. In terms of the ethics of research, the validity of results, the richness of materials collected, the possible consequences of distorting objectives so as to obtain cooperation, and the implications for future field work, the alternative approach of using a "cover story" to obtain quick results is not desirable.

The Klamath personality research grew out of Clifton's participation in a larger 114
study of Klamath reservation culture. The initial, unpublished, evaluation of the test and life history data was intended to improve understanding of the psychological consequences of acculturation in the Klamath case and to give additional depth to other studies of styles of Klamath behavior. This first approximation, although suggestive, did not prove entirely satisfactory, largely because of too mechanical a utilization of what are, in the trade, called "standard interpretative hypotheses." In short, the initial report was too cookbookish. At the same time the possibility of bias had to be considered,

648 Most Klamath live in one or another of the several
towns and settlements on the reservation, or else they have settled elsewhere,
364 in Portland, Salem, Eugene, in California, in Alaska, in the Midwest, or along
[167] the Atlantic seaboard. In 1955 the Tribe had 2118 members, and of these 40
percent lived away from the reservation (Stern & Swanson 1960). Partly because
[619] of the recent progress of the termination of federal supervision of the reserva-
tion, by this date the percentage of members residing off the reservation has
[161] probably increased. In fact, for years there have been numerous "tribal mem-
[619] bers" with no experience whatsoever of reservation life.

648 Throughout the years of White contact inter-marriage and inter-breeding have
144 been frequent. Today, more than 70 percent of the Tribe's members are, gene-
tically, less than one-half "Indian," and less than one sixth are "full-bloods."
[171] Many are indistinguishable in appearance from their White neighbors, as most are
not easily distinguished in dress and language.

175 The isolation of the early reservation period was soon removed by the influx
177 of White settlers, who at first took up farms and started towns near the fringes
of the reservation. Through inter-marriage and through the consequences of
[361] allotment of land to individual Klamath, many Whites were soon residing within
the reservation's boundaries, either on the lands of a spouse, or on land bought
[423] or leased from tribal members. Another source of change were the ever present
efforts of Agency officials to make over aboriginal ways, and later, the rapid
[657] growth of the lumber industry and the development of full fledged frontier com-
munities were also important sources of acculturative influences. In quick
[726] succession the Klamath experienced a period of armed conflict (the Modoc War of
[784] 1872-73), a religious revivalistic movement such as that which swept the plains
area, extensive governmental planning and intervention, the allotment of land
in severalty, and a growing participation in the cash economy. Because aboriginal
[181] Klamath values had stressed achieved status for those who worked to accumulate
[556] wealth and property, for some Klamath the early period of contact provided in-
creased opportunities, and there was a group of men who for a time were effective
[436] entrepreneurs. It was through such personal efforts and through the "easy money"
had from private sales or the leasing of agricultural lands, from pro rata shares
of boundary settlements, and from per capita payments for sales of tribal timber
that the Klamath made the transition to a money economy.

648 The participation in and contribution of the Klamath to the economy of the region
is a significant point of interchange between Klamath and White, and one with
[313] many ramifications. In considerable measure, the local timber industry prospers
[423] or slumps, depending on the allotted cut in the tribal forest. Similarly,
local merchants are somewhat dependent upon the assured income of tribal mem-
[434] bers, as they are upon the purchases of mill workers, fallers, and cat-skinners.
The major town on the reservation, Chiloquin, obtains the largest share of its
[632] revenue from sales at a municipally owned beer-hall and from the fines and for-
[551] feited bails paid by visitors to the city jail, both of which establishments are
patronized largely by Klamath.

648 In other aspects of community life the participation of Klamath is perhaps best
621 characterized as that of passive spectators. Many Klamath have come to have a
sense of being aliens in the heterogeneous local culture, although there is a
563 small assimilated minority.

[571] Thus Klamath may interact as equals in card rooms and pool hall, and are met
with a stereotyped "friendliness" in interactions in stores and on the street.
However, the great majority live in intimate interdependence separate from the
main currents of White social life. White ethnic exclusiveness is reflected

882
155 drop out rate of Klamath adolescents, a slacking of attention, and a decline
156 in test performance and grades.

871 Something of the character of adult Klamath concerns and behaviors has already
156 been suggested. Many work in only a desultory, disinterested fashion, and it
is unusual for a Klamath woman to have a full-time job. Thus self-concepts are
[461] not so closely bound to job or profession as are those of local Whites. In
1953, for example, it was found that 65% of adult Klamath were wholly or partly
434 dependent upon per capita payments for their livelihood. Whereas the reluctance
[462] of Klamath women to take outside work reflects the pressures on them to remain
in the home and the extent of their responsibilities there, it also reflects
the fairly secure economic position resulting from the special benefits of
tribal membership. Aside from the twice-yearly per capita payments, these benefits include the privilege of year round hunting and fishing, medical care, loan
services, tax exemptions on land and privileged employment rights at the Agency.
[464] On the other side of the coin, outside of the Agency, the principal local employers are Whites, and for one reason or another they are very reluctant to hire
tribal members. In historical perspective, the development of tribal income paid
out in the form of per capita payments has paralleled the decline of Klamath
participation in the labor market. The contemporary Klamath do not work so often
nor do they work so steadily as did their parents and grandparents. There are
fewer Klamath loggers now than there were in the past, almost no business men now,
and fewer active ranchers and farmers.

434 In spite of shifting policies and personnel, the influence of the Klamath Agency
657 officials has been one of constant supervision over and intervention into the
affairs of Klamath individuals and groups. The controls over the expenditures
of children's funds was noted, and the same controls are exercised with respect
[241] to those tribal members who have been deemed incompetent. Yet the activities
of stable ranchers and farmers have also been supervised by extension workers,
[654] and efficient, prospering Klamath farmers complain that, with a good price decided
on and a buyer waiting, they have to await the approval of an extension worker.
Thus the adequacy of Klamath individuals is frequently in doubt, whether by experience with a particular tribal member's high style of living, or by policy.
657 At the same time in many ways the Klamath have been protected from responsibility
426 for their own actions. Payment for debts incurred with local merchants is an
example, for the reservation being under federal jurisdiction, goods unpaid for
could not be repossessed, nor could income be garnisheed. As Stern and Swanson
phrase this situation, the Klamath have attained economic security "attended
by supervision."

657 Of course, through constant experience with Agency personnel and policy the
829 Klamath have learned that bureaucratic restrictions may be evaded or circumvented, and they have long since acquired knowledge of the appropriate manner
of phrasing a request for funds or services. The Klamath complain of this that
forced contact with the Agency has made liars out of them.

648 In summary, little more than a century of contact has merged the originally
177 distinct Klamath, Modoc, and Paiute, and has altered them physically, culturally,
171 and personally. In spite of a small assimilated minority and a large off-reservation population, the reservation Klamath exhibit a distinct way of life
657 which is novel if heterogeneous. This Klamath Reservation Culture is the
familiar context of everyday experience for contemporary tribal members. Thus
181 it is the source of what stability and security they know. No matter how variant,
or how disorganized this pattern of life may be, it is one whose outlines are
the consequence of the thousands of daily decisions, the many lines of action,

and the modes of behaving through which the Klamath interact with their be- 181
havioral milieu. For this reason it is not to be supposed that White exclusion- 657
ism or Agency policy alone are the significant antecedents of the stable
pluralism of reservation life. For a Klamath to leave the amorphous atmosphere
of his home or the circle of his drinking pals to enter into the unfamiliar and
unprepared-for activities of White life is a source of fear and anxiety.

Thus, however it may seem to the outsider, the existing way of life on the
Klamath reservation offers substantial predictability to tribal members, a place
to live, a corporate body with which to identify, and multiple stable human
relationships. As a cultural system it may be stable in form although changing
in detail, and therefore this novel set of human relationships is not likely
to quickly disappear. The Klamath today may not be the same persons who were [177]
settled on the reservation a century ago, and aboriginal Klamath, Modoc, and
Paiute cultural attributes may have disappeared, yet they are still self-con- [171]
sciously Indian. In studies of acculturation, it is frequently argued that groups
like the Klamath are marginal, that is, hung suspended between two cultural 181
worlds. We feel that such a metaphor is both confusing and misleading. It 657
assumes the presence of a reasonably intact cultural alter of aboriginal design
and a unilineal path of acculturation process. As indicated above, the former 121
is not present on the contemporary Klamath reservation. As to the latter, we
argue that the structural consequences of acculturation are many, and a lineal
assimilation process is only one of them. The Klamath situation, we feel, is
that of an unassimilated minority group which is itself very actively engaged in
maintaining its special position and which is subject to multiple external
pressures for maintaining its present boundaries. The Klamath are, therefore,
in a position analogous to religious and racial enclaves. They are a group
distinct from and in some ways opposed to American culture who fit, as it were,
into a special niche in the larger structure of American society. If the term
marginality is to be used with reference to any Klamath individual it can only
refer to his orientation towards conflicting reference groups in the heterogeneous
contemporary community.

Section III. Approach to the Rorschach Protocols

The interpretive approach to the Rorschach protocols was dictated to a large 121
extent by the overall purpose of the investigation. An avowedly inductive 125
and idiographic study requires a broadly clinical, not a narrowly statistical,
analysis of the obtained Rorschach responses. The conclusions reached on the
basis of this kind of research may be considered hypotheses to be tested in
controlled deductive research.

The validity of the Rorschach method for personality exploration is not at issue in the present study; there are obviously more clear-cut and efficient research methods available for that purpose. Rather, the test is being utilized as one means of gaining insights about the adaptive mechanisms of individuals in a particular sub-group that is undergoing an acculturation process — a case-study approach. These insights may lead hopefully to theoretical advances in that area of study called Culture and Personality.

From this statement of the general purpose of the research, several specific 121
methodological decisions follow. It becomes clear immediately that there will
be no comparisons of groups by statistical methods and few statistical tabula-
tions of group means and standard deviations. There will be no description of
that artificial construct — the modal Klamath personality. On the contrary,

121 (Levine, 1960) has indicated that this may be an extremely important measure
125 of ego strength. Whether this is supported in cross-cultural work remains to
[114] be determined.

121 The emphasis throughout this phase of the research has been on the functioning
15 individual — how he adapts to his environment in general and, whenever possible, how he behaves in interpersonal situations. In this regard Piotrowski's hypothesis that the movement responses reflect prototypal roles has been exploited extensively. By prototypal roles, Piotrowski means, "definite tendencies, deeply embedded in the subject and not easily modified, to assume repeatedly the same attitude or attitudes in dealing with others when matters felt to be important and personal are involved." (Piotrowski, 1957, p. 141). He makes it clear that he is referring to "psychological tendencies" only; in order to predict whether these tendencies will be expressed in overt behavior it is necessary to take into account many other variables (Principle of Interdependence of Components).

Piotrowski has written further that the FM (animal movement responses) reflect the subject's prototypal roles as they were prominent in the subject's past or as they influence his behavior in "states of lowered integration and in states of diminished consciousness and defective self-control," and, finally, that the m (inanimate movement responses) "indicate prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable."

Thus, for example, if a subject gives only very active or aggressive human movement responses (e.g., "two boxers slugging it out") it is hypothesized that his prototypal role is of this nature. If his FM are passive and his M are aggressive, we conclude that his present prototypal role is aggressive, but that when drunk, for example, he is more likely to become docile.

In actual Rorschach interpretation the complexities of multiple roles, the influence of other Rorschach variables, the inconsistency of role patterns, and so on, must all be evaluated very carefully in order to arrive at a meaningful
121 and valid personality description. Although considerable care must be taken to
181 avoid oversimplifying these interpretive principles, their judicious application
is often very helpful and may have led to the most important conclusion of the
156 present investigation: that the Klamath are characterized by a guarded and
[171] restrained approach to life and interpersonal relations. This guarded restraint is different from the Trukese blocking and from the dull apathy of the Alorese. The Klamath initial reaction times are not nearly as long as the Trukese, nor are their dark shading responses as primitive and poorly organized. On the contrary, their initial reaction times are only slightly longer than would be expected from a U.S. White group and their dark shading responses are almost as well organized. The guarded restraint of the Klamath seemed to be neither the result of marked blocking nor apathy. A more detailed discussion of this hypothesis will be appropriate, however, after the case studies have been presented.

159 157 psychotic symptoms, despite serious emotional disturbance, "because they control, or have reduced, the intensity of their emotional and intellectual processes to such a degree as to produce hardly any specific and easily recognizable schizophrenic symptoms." Their "capacity for energy control (shading) exceeds their capacity for energy output (color)" (Piotrowski & Levine 1959: 223). Thus, having expended all their energy on controlling their behavior and feelings, they are left with little energy for constructive effort and planning (low W).

[171] [154] This pattern may reflect a pathological adjustment in a white American whose culture demands long range planning and constructive effort. In the Klamath group, however, this emphasis on day-to-day pleasures and consideration for others may be more acceptable than the long range planning and self-aggrandizing behavior which is reportedly becoming the acceptable pattern in American suburbia. If this is true, this subject's adjustment may be perfectly fitted to his environment.

There is, however, additional, independent support for this description of this subject's personality. His preoccupation with the inner details (R2, R4, R24) indicate an approach to life characterized by over-cautiousness —almost suspiciousness — a peering into the situation, rather than an acceptance of it at face value. At the start of the test, he apparently requests clarification of the instructions. The analysis of the movement responses also will support this interpretation.

Despite the verbosity there is actually very little of this man's inner life reflected in this protocol. Rather than reveal himself, the S analyzes the subtle nuances of what is going on around him. He is like the "cat" on Card VIII, "he's watching something...I've no idea (what he's watching)...just watching...". The number of faces and the emphasis on "eyes" (especially the "dark beady eye" on Card IX) are also consistent with the interpretation that we are dealing with a suspicious person — he doesn't trust anyone very far. So all his energy (the little he has) is concentrated on analyzing the possible dangers in any situation, not viewing the situation for all the positive possibilities it offers.

[154] His pace is generally even except for delays to Card IV and VI, the darkest, most ominous of the blots. Is he disorganized by the depressive implications of these stimuli? If so, we would conclude that he tries to deny the gloomy aspects of life. The sun on Card II is "coming up," not going down and there is a kind of exuberance in his response to Card X. One wonders if he isn't trying to act the part of an optimist, despite occasional qualms about this position.

[156] The only human movement response in the record is R6: "a caricature of two people" and on the inquiry, in response to a question, "I guess they're dancing - jitterbugging I guess you'd call it." The movement was very slow in being verbalized, it was dehumanized (they are caricatures, not real) and it is stereotyped. As such, it probably does not reveal much of this man's conception of his role in life. Unless perhaps it means that he does not have a well-delineated prototypal role.

The FM, on the other hand, seem to reflect a more consistent image. R10 and R15 (the dog "looking straight at you" and the "watching bobcat") are both scorable as "guarded restraint" responses and indicate that this man's cautiousness, his "watchful waiting" have been past roles and are likely to appear in states of diminished control. He is not guilty or anxious about behaving in this manner.

125
128 response provided some of the first clues as regards this important personality
attribute (Clifton 1960). But other test evidence, as well as life history and
[157] observational data, leads to the same conclusion, regardless of the presence or
absence of a restrained movement response.
[124]

One facet of Klamath guardedness and restraint is the general reluctance of
157 Klamath individuals to reveal or communicate to others their needs, wishes, in-
156 terests, or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another character-
istic of Klamath persons may be associated with this reserve. The reference here
is to a general, overt, and conscious devaluation of the self. The Klamath sel-
[125] dom have much good and often much that is bad to say of themselves. Although
this characteristic is not directly manifested in the Rorschach records, these
records do indicate the presence of multiple and conflicting, or unacceptable
prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
155 culture we consider that this characteristic is probably adaptive, although it
might not seem so if measured against an ideal model of mental health based upon
65 the functioning of west European, urban, middle-class persons. Considering the
[171] realities of the Klamath situation, guarded restraint in itself may hardly be
considered as pathological. Yet so great a reserve and so extensive an insula-
[158] tion of the self from important human transactions may be a major source of stress
and may predispose Klamath individuals to variant forms of mental illnesses.

157 Several of the cases contained in this report provide evidence for this hypothesis.
158 In the instance of Slim, for example, we find that a superficially adequate ad-
justment may simply be the manifestation of an obsessive control over and reduc-
[121] tion of emotional and intellectual processes to the point of a tentative diag-
nosis of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are
examples of extremely loose, unrealistic and disorganized thinking with over-
tones, in some instances, of an almost paranoid suspiciousness, or a reliance
upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic
role or personna which is very poorly integrated with the rest of the personality
is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's
superficial warmth. We suggest that these more disordered aspects of adjustment
may profitably be seen, in part, as a function of a generally poor contact with
others, reduced insight into the self and others, and extensive social isolation.
The mediating difficulty may well be a relative absence of opportunities to vali-
date beliefs and convictions. Thus in many respects adaptive, Klamath guarded
restraint probably serves as a precipitating factor in thinking disorders, socio-
pathic adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

121

156 vague identification and, since it is largely through identification that the
562 super-ego is established, weak super-egos.

593 It has been suggested that what we have called guarded restraint may be a "front"
121 maintained only when Klamath are interacting with whites. The point is that
guarded restraint may be another name for the extreme suspicion and reserve of
156 many enclaved or colonized minority groups vis-a-vis representatives of the
177 dominant culture (Underhill 1960). It cannot be denied that, in fact, reserve
171 and suspicion do characterize much of the relationship between Klamath and Whites,
but the reserve and restraint which so characterize Klamath persons is not solely
a function of such situations. We agree that guarded restraint is one important
consequence of acculturative contacts, but the evidence of observation and life
histories clearly indicate that this is a personality attribute manifest in many
829 situations exclusive of the presence of outsiders. Life history subjects, for
example, speak of the "Indianness" of their parents, meaning precisely an aloof,
reserved style of interaction. Many other informants verbalize reactions to the
endemic if latent suspiciousness of Klamath life. Thus guarded restraint is not
purely an observer construct with a referent limited to the test situation. Certainly,
a measure of reserve and suspicion may serve utilitarian functions when
interacting with strangers, but the same characteristic makes strangers out of
neighbors.

121 Underhill's suggestion does raise the issue of a broader connection between
156 guarded restraint and the impact of acculturation. If there is such an association
then we should expect to find these attributes widely distributed among
177 other acculturated populations, especially those which have been exposed to the
171 imposition of external political and administrative controls, and deculturation
or detribalization. That there may be some validity to this hypothesis is sugges-
157 ted by the fact that attempts to communicate our findings to observers with experience
among other acculturated populations frequently evoke memories of similarity
in character. What we have called guarded restraint has been suggested
as characteristic of the contemporary Southern Ute (Stewart 1961) and especially
the Mountain or Towoac Ute (Canan 1961), and of the Cree, Northern Athabascan,
and Eskimo (Heinrich 1961). In each instance there are differences, but differences
which seem to play upon a common theme.

Personality attributes analogous to what we have called guarded restraint have repeatedly been discerned among other more or less acculturated North American Indian populations. Thus Barnouw describes the Wisconsin Chippewa as emotionally isolated, suspicious of outsiders, and fearful of expressing emotions overtly (Barnouw 1950: 22-23). Klopfer's analysis of Chippewa Rorschachs suggests that "...the individual is under pressure to become as emotionally independent of his environment as possible, and to expect very little from others." (Barnouw 1950: 27). The Ojibwa have been described as emotionally restrained, suspicious, and anxious (Hallowell 1955: 350). Hallowell's interpretation of these characteristics is that they constitute persistent aboriginal components of Ojibwa character structure. In a similar fashion, the Native-Oriented Menomini have been described by Spindler as a group characterized by a non-defensive reduction of emotional display, whose perception is narrowed to only a very selective portion of their environment, and who are further characterized by a non-manipulatory passivity. Outside of the presumed character structure of the Eastern Woodlands, the most widely distributed "aboriginal" characteristics of North American Indians, generally, are given by the Spindlers as non-demonstrative emotionality, great reserve, individual autonomy, and a generalized fear of the world as dangerous (Spindler and Spindler 1957: 148).

On the face of these parallel descriptions it would seem that the Klamath are 121
similar, as regards guarded restraint, to a variety of differently situated, 156
differentially acculturated North American Indian populations, populations with
diverse cultural heritages. These similarities are, of course, susceptible to 157
different explanations. It would be a simple matter, for example, to explain
away the similarities as false, that is, as being a function of unreliable tech- 171
niques of assessment and highly ambiguous descriptive constructs or constructs 177
lacking in validity. Aside from being no explanation at all, this approach would [114]
involve discarding most of the available cross-cultural psychological data as
well as existing assessments of the personality dynamics of North American Indians.
Although this is the course advocated by many methodological puritans in the area
of culture and personality research we choose to accept the similarities as valid.

A second way of explaining these similarities might invoke the assumption of an
underlying "North American Indian" character structure or basic personality ana-
logous to Devereux's delineation of a core personality type for the Plains
(Devereux 1951). Accepting this assumption the persistence of core traits must
then somehow be accounted for. In the instance of the Plains, Devereux presents
one possibility, namely that acculturation has resulted in a "stripped-down"
and impoverished personality type (Devereux 1951: 25). Somewhat differently,
Hallowell and his followers have argued that basic personality somehow manages
to weather the vicissitudes of history and acculturation (Hallowell 1955: 309;
Spindler 1955: 151). The common feature of both of these explanations is the [114]
assumption of an underlying, basic set of psychological characteristics linked
to aboriginal prototypes and common to the population occupying a given culture
area.

In the instance of the Klamath there is very little evidence to suggest, un- 121
equivocally, that guarded restraint was a dominant component of aboriginal char-
acter structure. The information is scanty and points to the definite presence 156
of great reserve and considerable suspicion, but only as one mode of interper-
sonal relations among others. Moreover, the Klamath reservation situation does 157
not allow a comparison of differentially acculturated groups after the model 177
used by Hallowell for the Ojibwa, and the effort to apply Spindler's technique [657]
of an internal comparison raised more problems than it resolved in this setting. [171]
Finally, the evidence from the Klamath psychological data indicates that, if
anything, older members of the tribe are less reserved and suspicious. In short,
we cannot assert from available evidence that guarded restraint was basic or
dominant in aboriginal Klamath character structure. We suggest that at minimum
this characteristic was present, but that it did not receive the emphasis it
now gets.

Aside from this difficulty, there are a great many conceptual problems associated 121
with the postulation of an underlying, basic trait of guarded restraint for the
North American Indians generally. We feel that it is stretching the point to 156
attempt to account for present similarities among unrelated cultures of such 157
different cultural heritages with a construct so broad. Due to the absence of 171
firm measures of aboriginal character structure this approach to explanation also
involves substantial methodological problems which are not easily resolved.

Instead of explaining contemporary similarities in either of these ways it is 121
possible to view modern Indian populations in the light of common acculturative
experiences and their status as dependent wards, as enclaved minority groups, 156
and as persons who have been promised much but who have attained little. Spindler 157
has suggested that when acculturation conditions permit both a ready identification 171
177

121 with the values of the dominant culture and provide access to the institutiona-
156 lized means of attaining desired goals there will be a successful psychological
157 adaptation to dominant standards, but that when these conditions do not exist
then there may be overt change in the content of culture unaccompanied by changes
171 in psychological characteristics (Spindler 1955: 199). In the same way, Hallo-
177 well suggests that constant association with powerful external agents, multiple
conflicting sources of reward and punishment and the ridicule and invidious comparisons which too frequently accompany acculturation situations may result in extreme feelings of insecurity, personality maladjustment, and what he calls the "frustration of maturity" (Hallowell 1955: 329).

Spindler's dual hypotheses are, of course, not the only alternative consequences of acculturation situations. We feel that between these polarities there are different modes of adaptation open, modes similar to those suggested by Hallo-
[178] well. We therefore assert, hypothetically, that the defensive, guarded, reserved style of interaction now characteristic of the Klamath is the product of the deterioration and decay of major patterns of aboriginal Klamath culture, a prolonged exposure to and considerable identification with the values and standards of the dominant White society, and the persistent denial of access to the means and instrumentalities necessary to achieve these goals and to live up to the standards. We argue, in this way, that there are a great many similarities between diverse American Indian populations as noted by many observers, that these similarities do not constitute the residue of generic Indian character traits, but that they are a function of a common depressed minority group status within contemporary American society. Our analysis of this is that these components, specifically, the guardedness, the reserve, the suspicion, and the lack of involvement in creative group activity, are very much analogous to what various sociologists speak of as alienation or anomie (Merton 1957: 121-194; Nettler 1957; Seeman 1961).

000 they are rather a cloddish, indolent, ordinarily good-natured race, but treacherous at bottom, sullen when angered, notorious for keeping Punic faith. But their bravery nobody can deny."[*]

THE PREHISTORIC PERIOD.

174 Before the middle of the nineteenth century the Máklaks people was unknown to mankind except to the nearest neighbors in Oregon and California. We are therefore justified in beginning its period of documentary history at that time, and in relegating to the domain of prehistorics all that is known of their previous condition. The information upon these points is furnished by three factors: tradition, archæologic remains, and language.

A. TRADITION BEARING UPON HISTORY.

121 Traditional folk-lore, when of the mythic order, generally dates from
773 an earlier epoch of fixation than historic traditions. The remote origin of *genuine* mythic folk-lore is sufficiently evidenced by the archaic terms embodied with it, by the repetition of the same phraseology for ages, and by the circumstance that all nations tend to preserve their religious ideas in an unchanged form. I am laying peculiar stress upon the term *genuine*, for Indians have often mixed recent ideas and fictions with archaic, original folk-lore and with ancient mythic ideas, the whole forming now one inextricable conglomerate which has the appearance of aboriginal poetic prose.

173 The Klamath people possess no historic traditions going further back
769 in time than a century, for the simple reason that there was a strict law
688 prohibiting the mention of the person or acts of a deceased individual by
171 *using his name*. This law was rigidly observed among the Californians no
784 less than among the Oregonians, and on its transgression the death penalty could be inflicted. This is certainly enough to suppress all historic knowledge within a people. How can history be written without names?

126 Many times I attempted to obtain a list of the former head chiefs of the two chieftaincies. I succeeded only in learning the names of two chiefs recently deceased, and no biographic details were obtainable.

174 This people belongs to the autochthonic nations of America, called so because they have lost all remembrances of earlier habitats or of migrations.

---

[*] Contributions to Amer. Ethnology, III, p. 253.

802 171 The numeration system of a people is a relic of a remote age, and therefore of importance for tracing the ancient connections of tribes. The quinary system is the most frequent counting method in America, and often combines with the vigesimal. The pure quinary system prevails in Ara, in the Chimaríko, Yuki, and in the Shasti-Pit River family, in Sahaptin and Wayíletpu, and it is also the system found in Klamath. Curiously enough, the Maidu Indians count by fifteens, and the decimal system forms the basis [801] of the Wintún, Mutsun, and Selish dialects. The mystic or "sacred" number occurring hundreds of times in mythologic stories is *five* among all the Oregonian tribes.

197 To sum up the result of the above linguistic inquiry, it may be stated that our present knowledge does not allow us to connect the Klamath language genealogically with any of the other languages compared, but *that it stands as a linguistic family for itself.* It has adopted elements from the tongues spoken in its neighborhood; and a common element, chiefly pronominal, underlies several of these and the American languages in general.

THE HISTORIC PERIOD.

Ἐκ δὲ τοῦ καὶ πιστὰ πάντα κάκιστα γίγνεται.

174 175 127 On account of the superstition previously alluded to, the traditional historic lore which forms so attractive a feature in the unwritten literature of the nations east of the Rocky Mountains and of Mexico is wanting entirely among the Máklaks, and we have to rely upon the meager reports of travelers and Government agents for accounts of the condition of the tribes in the earlier part of this century. Such notices of historic events are as follows:

000 According to a tradition recorded by Stephen Powers, an epidemic of small-pox broke out among the Modoc Indians in 1847, by which one hundred and fifty individuals perished.

The earliest historic conflict which can be ascertained with some chronological accuracy is the massacre of eighteen immigrants to Oregon by individuals of the Modoc tribe, and Ben Wright's massacre, consequent upon that bloody deed. The massacre of the immigrants occurred at a place on Tule or Rhett Lake, since called Bloody Point. Undoubtedly this was only

772 months brings on the seasons with the new life seen sprouting up every-
773 where during spring and summer. So the quadrupeds and birds which are
776 the first to appear after the long winter months are considered as the wives
821 of Aíshish, and the flowers of summer vegetation are the beads of his gar-
ments. He enjoys more popularity than his father, for the moon's light is
mild, not burning nor offensive, nor does it dry up vegetation and make
men and beasts drowsy like the rays of the midday sun. Many nations
also believe that the changes of weather are partly due to the phases of the
moon. Although the "Birth of Aíshish" myth obtained by me represents
Aíshish rather as the adopted than as the real son of K'múkamtch, other
myths state him to be his son resulting from the union of the sun-disk to
the red sky of the morning or evening, symbolized by the woman Le-tka-
[19] káwash. We must recall to mind that the term for *father*, p'tíshap, in
Modoc t'shíshap, is really the *nourisher, feeder*, and not the progenitor, for
it is a derivative from t'shín *to grow*.* Most other mythologies consider the
relation of sun to moon as that of man to wife, or of wife to man (cf. Deus
Lunus), but here the thing is different. There are no female characters of
importance in Klamath mythology, nor does the language distinguish
grammatically between the sexes.

821 The difficulty which we experience to distinguish solar and lunar dei-
171 ties from each other in some of the American religions is caused by the
197 circumstance that in many languages of this western hemisphere the term
for ***sun*** and for ***moon*** is the same. In such languages both orbs are distinguished from each other by being called day-luminary, or night-sun, night-luminary, and with some tribes the belief has been found, that both are actually the same celestial body, one being merely the image or shadow of the other. In the Maskoki languages hási answers for both, but the moon is commonly called ní'li hási or "night sun." In the Tonica language táχtchiksh, abbrev. táχtchi stands for sun, moon, and star, but the moon is usually named lá-u táχtchi "night luminary," the stars táχtchi tipulá, while the sun is either áχshukun táχtchi, "day luminary" or simply táχtchi. Of the Tinné languages many have tsā, sā, of the Algonkin languages kísis or parallel forms for both celestial bodies, separate distinctions being

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

821 added for "day" and "night." In the Tsimsián and in some of the Selish
171 dialects the terms for both also agree, but in the Shoshonian and Pueblo
197 languages they differ entirely. In Utah and other Shoshonian dialects the term for moon shows the archaic or reverential suffix -pits, -püts previously noticed (ma-atáwa-pits in Utah), which closely corresponds to *παλαίφατος* as used in the Homeric poems.

While the sun divides time into days, seasons, and years, our sections of time called weeks (quarters of the moon) and months (lunations, moons) are due to the revolutions of the moon. This is what caused the Klamath Indians to call both orbs by the same name: shápash *the one who tells*, which signifies: "which tells the time," or "time measurer." For the moon a parallel form exists in the Timucua, once spoken in Florida: acu-hiba *star which tells*, viz: "star measuring the time" and in the name of the Egyptian moon-god Tehuti, called Thoth by the Greeks,[*] also in our Germanic *mân*, English: *moon*, Germ. *Mond*, "the measurer."

Here as elsewhere the moon appears under different names, for in Klamath she is also called uk̲aúχōsh "the one broken to pieces." This term never applies to the sun, but only to the moon in the four phases, as a
[192] changeable body.[†] Originally this was only an epithet of the moon, but in course of time it gave origin to a separate deity, for Uk̲aúχōsh distinctly appears as moon-god in a myth, which relates his marriage to Wekétash, a frog-woman living with ten beautiful sisters on the west side of Upper Klamath Lake. Uk̲aúχōsh now carries her, the frog, in his heart, and this is what we are wont to call "the man in the moon." Should only a little bit be left of him when in the bear's mouth (referring to eclipse), she would be able to bring him to life again.

LEMÉ-ISH OR THUNDER.

776 All elementary deities in the Klamath religion, except K'múkamtch and Aíshish, are mysterious, shadowy beings, not sufficiently anthropomor-

---

[*] Various functions are assigned to Tehuti; his symbol is the *ibis-crane*, whose long, pacing steps evidently suggested to the myth-makers of Egypt the idea, that he was measuring the earth. The name Tehuti is derived from the Egyptian verb teχu *to be full*, for the measuring of liquids, grains, etc., is effected by *filling vases* possessed of certain cubic dimensions.

[†] Derived from uk̲á-uk̲na *to knock to pieces.*

773 times over them or by blowing at them, an act which is supposed to impart
776 life.

CONCLUDING WORDS.

128 The limited space allowed for this ethnographic sketch forces me to
suppress the larger part of the matter for the present and to relegate it to a
future volume. A few points characteristic of the two tribes may, however,
be added on the last page of this Report.

614 The Klamath Indians are absolutely ignorant of the gentile or clan
171 system as prevalent among the Haida, Tlingit, and the Eastern Indians of
582 North America. Matriarchate is also unknown among them; every one is
free to marry within or without the tribe, and the children inherit from the
595 father. Although polygamy is now abolished, the marriage tie is a rather
581 loose one. This tribe is the southernmost one of those that flatten their
304 infants' skulls, this practice continuing about one year only after birth.

764 Cremation of the dead has been abolished since 1868, though during
the Modoc war these Indians burned several of their dead. The custom of
suppressing the personal names of the dead is rigidly kept up at the present
178 time. Art never had any encouragement or votaries among the Klamaths,
769 and the only objects seen that could be regarded as art products were a
531 few rock paintings and a head-board on a grave near the Agency build-
532 ings, which was painted in the Haida style and represented a human face
flattened out to the right and left. Some baskets are artistically formed.
285 As there is no clay to be found on or near the reservation, pottery could
323 never become an art among these Indians. Their songs and poetry are also
artless, but nevertheless instructive, and several songs have beautiful tunes
533 that should be preserved. The musical and sonorous character of the lan-
538 guage fits it well for poetic composition; but a national poetry, to be of
success, would not have to adopt the rhyme as a metrical factor. Alliteration, assonance, or the prosody of the ancients would be more suitable to this upland language, with its arsis and thesis, than the artificial schemes which poets are devising for the modern European tongues. Who will be the first to teach the Muses the Klamath language?

NOTES.

* 539 764 Cremating the dead is a practice which was abolished by the chiefs on the territory of the reservation in or about 1868. At the Indian graveyard north of the Williamson River a hill of 12 feet altitude, where the corpses of Indians of the Klamath Lake (not Modoc) chieftaincy were burnt, is still visible and untouched since then. With the exception of the sentence from Skentanápkash to ítpa, the first paragraph refers to the present as well as to the former mode of funeral, while the second describes [171] the ancient mode of cremation. Cremation prevailed also among the Snake and Pai-Uta Indians, living in the vicinity of the Mák̲laks; cf. Dr. W. T. Hoffman, Pahute Cremation; Cremation among the Digger Indians, in Proceedings of the Am. Philosophical Soc., Philadelphia; vol. XIV, p. 297 sq., 414 sq., (1876). According to Stephen Powers, cremation prevailed among the Pomos of Northern California, west of the Sacramento River, and the Erio, a tribe living at the mouth of Russian River, believe that all deceased Indians will become grizzly bears if not disposed of in this manner. The Indians inhabiting the shores of Middle and Lower Columbia River placed their dead on platforms erected on hills, or into the canoes of which they had been the owners; the Kalapuyas on both sides of the Willamet River buried their dead by inhumation.

000 Our notice makes no mention of the mourning ceremony among the Modocs, by which widows had their long hair cut off at the funeral of their husbands, then dripped the resin from the pyre, liquefied by the heat, upon their bared heads, vowing not to marry again before this ghastly head-cover had worn off by length of time. The Modocs cremated their dead on any day *from the first* to the fifth day after decease, according to choice.

*539 764 [801] [171] **85, 1.** ţutenépni. Here we have again the sacred number five occurring so often in the traditions, myths and customs of the Oregonian tribes. Cf. 70, 1. 3. 82, 6. 88, 4.

85, 1. Instead of ídsha may be used Klamath Lake ílχa (*or* éna) lulukshåldshuk, to bring out for cremation. The northern dialect uses vumí only in the sense of putting dried provisions into the ground. A funeral is ílktcha in the Modoc dialect.

85, 2. shutédshna: they remove obstacles upon the road or trail, such as fallen trees or logs; they clear the passage. kăflatat means here the same as tchpinû'tat, 85, 4.

[192] **85, 2.** wawaſha. Another form of the verb waſha is said to exist in the Modoc dialect: wawaſha; its distributive form: wawawaſha.

85, 3. itpanŏ'pkasht is the synizesis of itpanuápkasht.

85, 6. Tánkni; the term mā'ntchni is often used instead.

85, 7. ánko for ánkuam kedshlákstat.

85, 10. pítchash for Klamath Lake pítchkash, "until it has gone out".

85, 11. Modoc hibéna or ipéna for the Klamath Lake yépa, yépona: to dig a hole.

85, 11. néwisht. Of this term the original meaning seems to be "thrown by hand into the air", a manipulation resorted to by some Indians, though not here, with the burnt ashes of the deceased.

85, 12. lk̲áppa. These piles of stones evidently were, as well as the piles erected on the spot of the burnt lodge, intended as monuments of the deceased. These cairns are of considerable size, and can be seen in the old Modoc country at the present time.

85, 16. pĕn húnkĕlam etc. Pĕn introduces the verb vûmi', and k̲'léka is a verb coordinate to vûmi': "his children die, right there again they bury them."

000 Nkā'kgiuga t'shi'shap p'kī'shap taúnäpni waíta k̲á-i tchû'leks pán,

NOTES.

*539 With the exception of the first, these ethnographic notices concern the people composing the southern chieftaincy as much as those of the northern.

189
171
115

I. The four items of section I are worded in the Klamath Lake dialect, and were obtained from Frank, a young Indian settled at Kuyamskä'-iksi, "the Crab's River-Trail," on the Williamson River.

90, 1 etc. The census figures given in the first paragraph refer to one of the latest counts made of the individuals in the tribe, probably to that of 1876.

90, 1. vunépni laláki gítko. Correctly worded, this phrase would read vunepä'nash lalák̲iash, or vunépnish, or at least vunépni lalák̲iash gítko.

90, 2. pé-ulatko ought to be used only when units are mentioned after the decads of figures. If the relator wanted to say, 180 men were counted, the verb shä'tui, shétui would be the proper term. Cf. *Note* to 70, 8. 9.

90, 3. Tumántka, "by the many", by the crowd: by the majority of the men in the tribe.

90, 7. hishuátchyash is a form for the word *man*, *male*, common to Klamath Lakes and Modocs, but more frequently used among the latter. The reverse is true of the form híshuaksh.

90, 10–13. Part first of the fourth notice refers to dances at the communal dance-lodge, organized and directed by chiefs. The chief starts the songs; sometimes the men, sometimes the women sing in chorus; or a song may be sung by all present. When the chief sees one, who does not sing, he cries out: "i tchuín; túla shuín 1!" All dances are accompanied by songs or other music.

90, 10 ul probably stands for ûn, û'n, û'na, a conjunction more frequently used in the Modoc than in the Klamath Lake dialect.

/000 Móatuash, k'le-ugtkinápkasht tchíalash Móatuashäm kóketat, ká-i mhû' lúela skó; Mō'dokni tchí'sh lóla shuátash kíäm tchûká shátma, humásht-gisht ká-i lúela.
The Pit River Indians, (lest) would cease to come the salmon up the Pit River, not grouses they kill in spring time; the Modocs also assume, sage-hens the fish to swim up stream invite, therefore not they kill (them).

NOTES.

*539 171 I. What is contained in these short items refers equally to the Klamath Lake and to the Modoc people, although those contained under I. were obtained from various informants belonging to the former chieftaincy.

[192] 133, 2. páka to howl, bark; pák'la to howl repeatedly, to howl for a while; pák-luipka to howl for a while in the distance towards somebody.

[177 231] 133, 4. 5. The cat and the chicken being but recently introduced among these tribes, this superstition must have been transferred to them from other animals. By inversion, the words tchíkiu gû'lu, *the hen*, appear here widely separated from each other.

[192] 133, 6. Kú-i tchämlûk has to be resolved into: kú-i tchē mál (for málash) hú'k: "bad then for you this is!" Cruel fights will follow.

133, 7-11. This story is not clearly worded, but we are taught by it how these Indians are conversing among each other with laconic breviloquence. An Indian living in the vicinity has heard the whining of the dog which means death to his owner. He goes there, shoots the man and takes to his heels. A relative of the murdered man comes up and is mistaken by others for the murderer. They deprive him of his wife, his property and his liberty; he becomes a madman on account of the injustice done to him.

[825] 134, 1. 2. The raven (kák) is supposed to be a bird of fatal augury, because he was seen devouring the flesh of dead Indians. Compare: General *Note* on page 130.

[202] 134, 4. kíukayunk. They adjust a rag or piece of skin to a pole and stick out that improvised *flag* on the top of the lodge to notify neighbors that they had a dream last night and desire an interpreter for it.

[525 825] 134, 5. One of the legs of a dead black tmélhak-squirrel is cut off and laid under the gaming-disk or the pá'hla to insure luck to the player.

134, 7-12. Tchásháš etc. This is a fragmentary extract of a scurrilous skunk-myth, which I have not been able to obtain in full from my informant, the Modoc chief Johnson, who speaks the Klamath dialect. This myth is well known through the whole of Oregon, for parts of it are embodied in a popular and melodious song of the Mólale tribe, whose ancient home is the country east and southeast of Oregon City and Portland.

134, 7. 8. máklaks nánuk is the direct object of hushtsóga; the skunk killed them by his stench.

[601] 134, 9. tû'paks stands for tû'pakshash; túpakship, abbreviated túpaksh, is properly the younger sister, as called by or with reference to an elder brother, while pa-ánip

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 171 is the elder sister, called so by or with reference to a younger brother. Two other terms exist for the relative age of sisters among themselves.

[601] **134, 11.** pátkalp'le. The myth adds, that the eagle got up again at dinner-time and that after washing the face he took a nap before taking his sister home.

[525] [777] **II.** These items were all obtained in the Modoc dialect from J. C. D. Riddle. Many of the articles mentioned as gamblers' amulets are supposed to bring good luck to the gambler on account of their *scarcity*, which must have made them more interesting to the aboriginal mind than other objects of a brighter exterior.

[192] **134, 13.** ntággal, ndákal: to find accidentally; shléa: to find, generally, after a search. vumí' is to hide away either on one's own person or in the ground.

134, 16. 18. tídsh tínχa is to succeed, to be lucky; without tídsh in: hútoks tínχantko gi, that man is lucky.

[411] **134, 17.** shtáp is a black arrow-head made of obsidian, a volcanic rock found in several places in these highlands.

135, 1. hä'-atoks is formed from hä toks with intercalation of the declarative particle a.

[192] [193] [825] **135, 3.** k̲'le-ugtki-uápkasht is a periphrastic conjugational form composed of giuápkasht, of the verb gi, and of k̲'lé-utka, the usitative of k̲'léwi, to cease, stop, terminate; -utka has turned into -ugt- by metathesis. Literally: "would habitually cease to be in the Pit River." mhû', the grouse, is called by the Klamath Lakes tmû'.

*539 171 [415]

REFLECTIONS OF EVERY-DAY LIFE

MONOLOGUES IN THE KLAMATH LAKE DIALECT BY JOHNSON, CHIEF OF THE MODOCS

K̲á-i	mish	nû	ó-it	nû	tidsä'wa	nté-ish,	shliútuk	mä'makla	pá-uk	shlínk
Not	you	I	to let have	I	like	(my) bow,	for shooting	ducks	to eat	killing (them)

with arrows.	I like	not	to you	to give (it),	over there	I will go	taking along	bow and arrows

gé-u,	hishlátsanuapka.	Yó-ishi!	tatála	k̲ä'gi,	k̲á-i	shláa	tatákni	yû'lχ;
my,	(and) will amuse myself by shooting.	Are lost!	right (ahead)	they are not,	not	I found (them)	where	they went down;

yó-ishin,	mā'ns	k̲á-ika.	Ūnds	mbúsant	pēn	k̲áyakuapk.
they are lost,	for a long time	I searched.	Some-time	to-morrow	again	I will look out (for them).

Shikútchipk	tchiká	kĕmutsátk;	undsē'ks	séwanuapk	páthi	giúga
Walks on stick	an old	decrepit (man);	some time	I will give (him)		to eat

méhiess;	yuyálks	tsi	pá-uk	hûn	tchē'k	tídsh	kí'-uapk.	Kí'shtchipk	huk
trout;	being poor	thus	through eating	of it	then	at once	he will feel.	Comes to me	this

snéwedsh;	onī'sh	kíäm	shéwant i;	tû'm	nû'sh	shewantamnuápka	sáwalktko
woman;	to her	fish	you may give;	plenty	to me	she will continue to give	having received presents.

Kámp'kuk	k̲éliak	pásh	tiä'ma.	Undsē't	kátchkal	pa-uápk	gé-utala steínash.
The indigent	without	food	is hungry.	By and by	tobacco	I will chew	to my heart's content.

*539
171

Sanáhole	kátchkal	titchéwank;	ū'nds	pēn	mbúsant	pá-uapk	kátchgal
I like	tobacco	well enough;	by and by	again	to-morrow	I will chew	tobacco

pátkēlank.	Kaní	shlé-uapka	ū'ns	stoyuápka;	tóla	pákuapka	ū'ntch;	pēn
while getting up.	Outdoor (anybody)	should I see,	then	I'll cut off (some for him);	with (me)	he will smoke (it)	then;	again

wutuápka	kinkáni	kátchgal;	kinkáni,	k̲á-i	túmi,	tchē'k	pēn	túmi	pákuapka, 8
I shall spend	a little	tobacco;	(but) little,	not	much,	afterwards	again	much	I will smoke,

pakólank	sχólakuapka.
(and) after smoking	go to bed.

NOTES.

Of the two paragraphs of "Reflections" submitted, the first refers to the loss of some hunter's arrows, which had been loaned to somebody together with the bow. The second speaks in a rather egotistical sense of the pleasure which is afforded by succoring helpless and indigent people.

*539
171
192
[193]

136, 3. k̲ä'gi. This refers to some arrows, which cannot be found at the spot, to which they seemed to fly.

136, 4. 5. Untchēk, abbreviated undsē, ū'ntch, únda, ūns, points to some undetermined epoch in the *future:* by and by, after a lapse of time, some time from now; undsē't, 136, 8., through apocope and synizesis, stands for untsē'k at; undsē'ks for untchēk tchish.

136, 5. Shikútchipk tchiká kēmutaátk, grammatically incomplete forms standing for skikutchípka t'shíka kēmutaátko. The word *stick* is not expressed in the text, but the suffix -ipka, united to shikútcha, expresses the idea of "walking while leaning oneself upon something or somebody". Cf. láyipka, to point the gun at the one speaking; tilō'dshipka, to see somebody coming towards oneself.

136, 6. kí'shtchipka, to step towards the one speaking; cf. *Note* to 136, 5.

136, 7. onī'sh for húnish, cf. ó'skank for hū'shkanka, 65, 1. Húnish is the objective case of hū'n; but this pronoun is not regularly used when speaking of animate beings; hū'nkiash would be grammatically correct.

136, 7. shéwant i. The words onī'sh kiā̆m shéwant i are supposed to be directed to one belonging to the speaker's household.

136, 8. The term kátchkal, tobacco, expresses the idea of an *intermixture* of several kinds of weeds or leaves for the purpose of smoking them.

136, 8. pa-uápk. A more appropriate term than this for masticating tobacco is: kátchkal kpū'yumna.

137, 1. titchéwank. This is in fact the participle of a verb: "I like tobacco, being fond of it."

137, 2. stoyuápka: I shall cut off a piece from a stick of pressed tobacco and give it to him. Cf. stuyákishka, to clip the hair.

137, 3. kinkáni kátchgal. If this and the following were not worded in the conversational slang, it would read: kinkánish kátchgal; kinkánish, k̲á-i túma, tchē'k pēn túma (or tū'm) etc.

[274]

137, 3. k̲á-i túmi. Indians are not often seen to smoke continuously as we do; those inhabiting the Klamath Reserve take a few whiffs from their small, often home-made pipe, then pass it to the neighbor and emit the smoke through the nose. Sometimes they swallow the smoke for the purpose of intoxication, and the elder women smoke just like the men. Cigars offered to them are cut small and serve to fill up their tobacco-pipe.

MISCELLANEOUS SONGS

OBTAINED IN THE KLAMATH LAKE AND MODOC DIALECTS.

1. K̲ó-i ak a nä′pka Yámatkni gatpam′nóka ⏑ ⏑ –́ | ⏑ –́ ⏑ | –́ ⏑ ⏑ | ⏑ ⏑ –́ | ⏑

Disastrous times we had when the Northern Indians arrived.

2. Nä′nu wíka-shítko múkash hä′ma –́ ⏑ – ⏑ | –́ ⏑ – ⏑ | –́ ⏑

I hear the owl's cry and very near it seems to be.

3. Mbû′shant käíla hämō′la, –́ ⏑ | –́ ⏑ | –́ ⏑ ⏑
shitchákta nä′ts käíla, ⏑ –́ – | –́ ⏑
shiukuapkúka nä′ts kä′la. – – –́ | ⏑ – –́ | ⏑

In the morning the Earth resounded,
Incensed at us was the Earth,
For to kill us wanted the Earth.

4. Wákaptch nen hí′tksh Ê-ukshi nē′pka,
nû′ kam hí′tksh telû′lit.

To see how Klamath Marsh appears from there,
I wish to look down on it from that height.

5. K̲ú-idshi nû kí′pash nû lulína

Dressed in poor garments I stray around.

6. Tutíχash nû lulína ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑

I am going astray while dreaming.

7. Kapkáblandaks! ō′kst a tkaléga ndéwa ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ –́ ⏑

Be silent! her body arises from the dead to scream!

8. Mû′ni nû lak̲í gí, k̲á-i kánam shlékish; –́ ⏑ | –́ ⏑ | –́ ⏑ ‖ –́ ⏑ | –́ ⏑ | –́ ⏑
k̲ó-idsha ne-ulχóga käíla tilangédsha. –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ ‖ –́ ⏑ | –́ ⏑ | –́ ⏑

I am a potent chief, nobody controls me;
The mischief-doing world I upset.

9. "Käíla nû shulēmokē′dsha", –́ ⏑ ⏑́ | –́ ⏑ ⏑ | –́ ⏑
kē′nta käílatat tgí′kēlan shuína. – ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑

"I take the Earth up in my arms and with it whirl around in a dance";
On this soil I am standing and singing [the above words].

hû' mish hû' shnekshituápka. –́ ⏑ ⏑ | – ⏑ ⏑ –́ | ⏑

Go to meet Aíshish; he will save you.

12. Tídsh hûn liulekán tchiálash shakatchóāla!

Halloo! let us form a circle and screen the salmon against sun-heat!

13. Kilidshi'ga shépolamna –́ ⏑ – ⏑ | –́ ⏑ – ⏑

They carry long-necked ducks on their backs.

14. Kaukátsi Yaína wō'n a shû-û'dshant î! –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

Follow up the elk and chase him upon Kaukátsi Mountain!

NOTES.

The first eight songs are worded in the Klamath Lake dialect, the third is of a mythic character. Songs 7–12 are worded in Modoc; 8 and 9 are K'mukámtchiksh songs. A few songs or fragments of such, which would come nearest to what we call nursery or Mother Goose's songs, will be found in the Myth of the Bear and the Antelope: 120, 11. 12. 13. 121, 9. 17. 122, 12. 13.

192; 1. This song is sung by women only, and seems to point to an ancient invasion of the country by tribes from the North or from Columbia River.

[825] [821] [192]

192; 2. The owl's cry is of fatal augury.

192; 3. Girls' song. When at sunrise a haze or fog extends over the country, this is supposed to be a sign of the Earth's wrath against men.

192; 5. ki'pash is no word at all, but seems to stand for gitko-ptchi.

192; 7. The Indians were reticent about the meaning of this song, and hence I presumed that ō'k was intended to mean some deceased person, since these are spoken of as hû'k, *he, she*. Then the sense would be: "Be silent! that dead squaw is arising to sing a loud song." One Indian informed me that ō'ksta meant a squaw, and pronounced it ō'ksht (húnkisht?). Cf. *Note* to 35, 8 and page 130, second *Note*.

[192] [193]

192; 8. These trochaic verses are called the K'mukámtchiksh-song, and a variant, tuálam, exists for kánam. The alliteration of the k's and n's is very conspicuous. The meaning was given as follows: "I the omnipotent and unseen ruler of the universe will chastise and turn it over for the manifold crimes committed in it by Indians and men of other races."

192; 9. This is another K'múkamtch-song, in which he menaces to destroy the world for its misdoings. I have put the first line in quotation marks, because it forms the words or text of the song. The first line is sung about a dozen times before the second is sung once.

193; 10. Christian song, referring to the day of last judgment. Aíshish, who is a deity representing the powers of nature with animal attributes, has been in the mind of some Modocs identified with Jesus.

13

*539
533

193; 11. Song of Christian origin, in which Aishish is also identified with Jesus for no other reason than a fancied similarity of names.

171

193; 12. When of a party of fishing girls one catches a salmon or other large fish, all the others quit their lines, arrive on the spot, roast the fish while singing these words and eat it up.

193; 13. This song is common to Modocs and Klamath Lakes and is descriptive of children amusing themselves with ducks. Pretty melody.

D. *Dancing tune heard from Warm Spring Indians.*

kaní luya . . . . . uya tasí wene nāsi

*539 generation, while others contain words of the language actually in use but ground down
533 or defaced in such a manner as to make them unintelligible. The variations in which these songs are sung are infinite in number, since they are fancifully produced at the will of the singer. I thought it sufficient to give a few of these variations only, and took care to mark the higher pitch of the voice, a sort of musical arsis, by the accentuation. The majority of them form an accompaniment to the motions made while gambling.

115 **194**; 9–17 were obtained from a young Indian, Frank, living on the Williamson River. Cf. page 91, second *Note*.

194; 16. kalena tená is rendered by: "ye are all dead at once"; which means: all of you have lost in the game.

171 **194**; 18–195; 4. Playing tunes sung by Modoc and Klamath Lake Indians when sitting at a spélshna or other game, also while musing, travelling or working; given by Jeff. C. D. Riddle. The person who deals the sticks in the spélshna-game is the one who sings the tune.

171 **194**; 18 and 19. 20 and 21. 22. Melodious tunes sung by Modocs and recently introduced among these Indians.

195; 2. 3. These are among the most frequent tunes hummed while playing the spélshna-game. Like 3 and 4, 1 and 2 are often sung alternately.

195; 3. 4. These words are made up from the terms by which butterflies are called: walwilégash, yapalpuléash.

A. These dance-tunes, **195**; 5–9, are in use among the Klamath Lake people and were obtained from Minnie Froben. The first of them sounds almost like **194**; 4. 5. Little bells are often rung while dances are performed and dance-tunes are sung. Women and girls of the Modoc tribe end their songs with a protracted i-ū, while the men habitually conclude them with a loud u-ó'hu.

B and D. Obtained from Dave Hill; sung among the Klamath Lake people.

C. Given by Long John's Ben. They begin with the sound h-, like the majority of the Shasti tunes.

E. All obtained from Jeff. C. D. Riddle.

196; 1. Repeated indefinitely, as soon as dancing assumes a *quicker* measure. Compare with it the song of the skunk **162**; 7, that of the quiver, **163**; 8, and *Notes*.

196; 3. stáni, *full*, seems to allude to the formation of a ring for dancing. Cf. stá hashámpka **23**, 12. and what is said of **196**; 7.

196; 4. 5. The last group in this tune, hoyó winnâ'-â', serves sometimes as a refrain, sometimes as a stop.

196; 7. Of foreign introduction, as shown by the sound r. Sung in alternation with stán, stán **196**; 3 and said to come from Warm Spring Indians. **196**; 2 sounds very much like: "how do you do, sir?"

196; 8. Probably contains the words: k̲'leká a hû, "he, she is dead"; kōlayá-a serves as a refrain, sometimes as a stop.

196; 9. The day before the funeral of Púkish, mentioned in Doctor John's trial, I heard his aged mother sing this tune. Other mourners in the funeral tent sang what is contained in **196**; 8. 10.

196; 10. Funeral tune heard from Snake Indians at Yáneks, on Klamath reservation. They join hands and sing this melancholy tune for hours; the higher the deceased stood in his tribe, the longer lasts the wailing.

771 To treat aboriginal Klamath religion under three headings of shamanism,
[791] power quest, and cosmology is patent oversimplification. In nature and
[551] content these features formed an integrated configuration reflecting a major
cultural preoccupation. It is true that the shaman in each community played
a dominant role and in his capacity as curer, magician, and entertainer com-
[787] manded the utmost in social prestige. On the other hand, as was common in
western North America, every individual, at puberty and thereafter, deliberately and repeatedly sought contact with a variably defined spirit world.
Thus Klamath culture had a variation of the American Indian guardian-
773 spirit theme. Less specifically formalized, and so perhaps, less well integrated,
776 were the elements of myth and tale, the rationalizations for the presence of
various natural phenomena, for eschatology, and for the general conception
of the universe. Like adjacent tribes, the Klamath interested themselves in
animal spirits. These were of particular importance in providing shamanistic
power. In the individual power quest, however, the sources from which spiritual
forces emanated were less specifically defined. A rather wide range of super-
natural powers was recognized, some being animals, some vaguely anthro-
pomorphic, others relating to such natural features as mountains, streams,
rocks, or even landmarks like Crater Lake. In respect to these forces an
involved folklore has arisen which allows some classification of the Klamath
[775] concepts of the supernatural. In this realm, for example, are views about
the abode of the dead and the nature of ghosts and souls, these being carefully
differentiated from nonhuman spirits.[3] Here too is a body of myth relating
to superhuman dwarf men and women, to the forces in specific places or
natural phenomena in the Klamath terrain, and finally, the most important
for this discussion, to the culture hero, the anthropomorphic Kemu'kemps.[4]

[171] Kemu'kemps, while not usually identified with an animal spirit, has many
characteristics suggesting the folklore regarding Coyote in the Plateau-
Basin. He is at once creator and trickster, angrily forbidding in some contexts,
indifferent in others, and in still others a ludicrous buffoon.

[825] Essentially human in conceptualization (a myth complex relating to a
[821] human hero also occurs in adjacent regions), Kemu'kemps is sometimes
identified with the marten, whose younger brother is weasel, and with the
winds.[5] In the myths assembled by Gatschet, he constantly rivals his magically
born son 'Ayšiš, whose destruction he repeatedly plans, often with the result
[821] of encompassing his own. Weather, such as rain or heat, was also attributed
to him. Kemu'kemps is also the creator, and there are numerous folktales
which tell how he brought various locations into being. At his instigation,

[113] 1939), cf. 145-149; Erminie Voegelin, *Culture Element Distributions: Northeastern California* (Anthropological Records, 7: 2, Berkeley, 1942).

[3] Spier, 1930, pp. 100 ff.

[113] [4] Cf. Albert Samuel Gatschet, *The Klamath Indians of Southwestern Oregon* (U. S. Geological Survey, Contributions to North American Ethnology, Washington, 1890), pt. 1, lxxix-lxxxv, and pt. 2, 138-140. A summary is also given by Spier, 1930, loc. cit.

[5] Gatschet, 1890, pt. 1, lxxxii-iii.

The towns listed below are mostly winter settlements. Each held one or more earth-lodges. There may be more than are listed on Sprague river, the only part of the region I did not visit. With this exception I think none have been overlooked.[29] The towns are grouped in the list according to tribal subdivisions. 361

I. *Klamath marsh—Williamson river group* (*ă'ukckni*).—Settlements are in two principal groups: along the southern margin of Klamath marsh and on the lower Williamson river. Although a few more were indicated in the latter region, I was told that the winter population at the marsh is the larger. They do not live on the western side of the marsh, as the snow-fed streams there are too cold for fish. The upper part of Williamson river, a rugged canyon, is unoccupied, but the towns are practically continuous from above the Sprague river junction down to the point where the river leaves the hills. Several others are on the lake front near-by. Evidently the middle Sprague river settlements should be included with this subdivision, but there is some doubt. Towns there are widely separated and extend a considerable distance up the river; the easternmost is somewhere west of Gearhart mountain. I am not certain that Sycan river is regularly occupied; roots are dug there. Sycan marsh is not occupied; it is a summering place for ă'ukckni, for those of Yainax in particular. 131 361

1, mŭ'tcuia'ksi, near the bridge toward the eastern end of Klamath marsh. 131 361 103

2, k'ɛtaiwa's, along the eastern side of the marsh. A cremation pile lies south of this town.

3, gūpgūa'ķsi, houses stretching for perhaps two miles here, with a cremation pile near-by.

4, i'wal, and 5, kla'djōķsi, houses for some distance along this tongue extending into the marsh. A third cremation pile is east of i'wal.

6, du"llķūt, a very large town, perhaps a hundred house pits in an area three hundred yards by one hundred. Others extend along the marsh to the east.[30] All the tribelets congregated at this spot in the summer to gather lily seeds.

---

[29] Gatschet lists sites (1:xxviii footnote, 142, *passim*). Many of his items are only place names; no permanent town is included that is not also in my list. In a *few* instances he has misinterpreted his information. [114]

[30] This would be an excellent site for archaeological exploitation. House pits here are more distinct than any others I have seen; elsewhere they have been leveled by the plow. [172]

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

side of Wood river in much the same locality. These may be the same site. 103 131

V. *Klamath Falls group (iu'' lalo'ŋkni).*—All the people of the lake from Modoc point southward are named for their principal locality, 361 iu'' laloŋɛ, Klamath falls. Despite the large area, they are relatively few in number. In summer they resort to the marshes west of the lake or fish on Lost river. The district along the eastern shore of the lake from Modoc point nearly to Algoma is called ne'' luḳsi (ne'' luḳs, a late sunrise), from the circumstance that a low mountain here cuts off the morning sunlight.

45, kɛt!ai'ksi, point of rock, a promontory two miles or so northwest of Modoc point, is their northernmost settlement.

46, suwiakă'ĕks, jump over, is a large village at Modoc point. It extended on both sides of the headland and for three-quarters of a mile south. The place takes its name from a large rock (about three and a half feet high) which stands a half-mile south of the point. It was a trial of skill to run uphill and jump over the rock. Bare island (au'emi) opposite is their camp site, and has no permanent settlements.

47, iulă'u, promontory, is a fishing village occupied in early spring. Pictographs are painted on the rock slide north of this.

48, diu'wiaks (named for its little spring, di'wik) is a winter settlement at the railroad point Ouxy. Little fish ran in the spring [226] early in the year.

49, ḳau'ŏmŏt, a half-mile south, is, like all these lake sites, crowded along the foot of the mountain on the lake shore. There are many earth-lodges about a large spring here. The lodge rings are so clear that this would be a good place for archaeological excavations. Its [172] name is from ḳau'ŏm, a place where fish run.

50, dI'tk!aḳs, boiling spring, is now known as Barclay spring. [133] There are many earth-lodges north and south of this. Two cremation piles are to the north on the highway, one distant a hundred yards on a rock slide, the second twice as far and directly on the southern boundary of the reservation. Unlike the cremation piles on Williamson river, no glass beads or iron was to be found at this second site. South of Barclay spring by three hundred yards is a deep nameless [231] spring into which pups are thrown to train them for hunting. A large [343] sweat-lodge used by mourners is situated at the foot of the slope near the angle of the marsh east of Algoma.

ONE

[P.3]

The Aboriginal Klamath-Modoc

EASTWARD FROM THE LOFTY CASCADES OF WASHINGTON AND OREGON 133
stretches the elevated and broken country of the central
Plateau. Across its face, rivers carry waters from northern watersheds and the slopes of the Rockies and, cleaving the mountain
barrier, flow to the sea. Upon the ladder of their waters, the homing salmon mount in seasonal surges to spawning grounds far to 136
the interior. It is a province once richly endowed in game, and,
early in the peopling of the New World, the Indian found it. In 172
the period toward the end of the Pleistocene period, while the 133
glaciers ebbed upon their centers, some eleven thousand years
ago,[2] some of his numbers camped along the Columbia, at the head of an estuary that in those days extended upriver to The Dalles, and left behind antler combs, stone bolas, blades, and the obscure and humble bric-a-brac of the camp. Further upriver, in the open lands of Lind Coulee, others hunted the bison. Below and east of the Plateau, unnamed tribesmen camped along the Pluvial lakes of the Great Basin, whose waters, now gradually drying up, attracted the waterfowl and animals that in turn drew the hunter. In the timeless dessication of its caves, at Fort Rock, Danger, Gypsum, and Lovelock their sandals, basketry, and spear-throwers have been found.

Along the southwestern flanks of the Cascades, a great fault had formed a crescentic trough some one hundred miles in length by twenty-five in breadth. Rivers and creeks fed marsh lands and broad lakes within this great highland and created an earthly paradise for the early hunter-fishermen. Their initial entry has been estimated at about ten thousand years ago, and by the time

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10
Modoc NS17

[Klamath Reservation]

K 172 133 the eruption of Mount Mazama created Crater Lake and strewed its pumice in thick beds over the countryside, some 6,500 years ago, they had long been in occupation.[3]

K M 101 172 Here, with the passage of time, the peoples later to receive the names of Klamath and Modoc began to take on their present way of life. Their cultural position was at once peripheral and strategic, for they lay at the boundaries of the emergent cultural provinces of the Great Basin, the Plateau, and California, and though they stemmed fundamentally from the Great Basin, they were also subject to influences flowing from California and the Plateau. Consistent with their relative geographical position and ecological resources, the Modoc diverged toward California and the Klamath toward the Plateau; and when in turn the influences of the North Pacific Coast—extending from southern Alaska to northern California—reached them, it was again the Klamath who were somewhat more receptive. Despite their differences, the K M 101 197 two peoples retained a substantial common base: they spoke dialects of the same language and felt their political separation to have been a recent event.[4]

Indeed, the linguistic evidence is consonant with a long autochthonous development within this region. Klamath-Modoc finds its closest linguistic congeners within the Plateau, in Cayuse, Molala, and the northern Sahaptin Tenino, Klickitat, Yakima, Umatilla, Walla Walla, and Nez Percé. Taken together, these languages are seen as more distantly related to others spoken in Western Oregon and in the Sacramento-San Joaquin drainage of California, and like them are assigned to the Penutian phylum.[5] (See Map of Tribal Distribution in Oregon.)

K 133 226 361 433 For the Klamath, the dominant features of their landscape were the marshes and streams, with their rich resources of fish, mussels, and waterfowl. Their winter settlements, fringing the shores in settled places, were located where fish could be caught most of the year, clustered densely upon Klamath Marsh and the eastern shore of Agency and Upper Klamath lakes, extending down to Link River. They lay as well upon the Williamson River which runs in a bow some sixty miles, passing through the Marsh to empty into Upper Klamath Lake, and upon its eastern tributary, M 133 226 224 433 the Sprague. In their more open country to the south, the Modoc were less favored and less open to influences from fishing peoples,

Notes

ONE. THE ABORIGINAL KLAMATH-MODOC

000

1. "Nolis Gaeni" (The Afterworld), narrated in Klamath by Lula Lang. Stern (1962), p. 112, original footnotes omitted.

2. There is now mounting evidence, even from the Northwest itself, suggesting that man may have been in western America for perhaps three times as great a period.

3. Cressman (1956), pp. 470, 463 ff. This work is the principal source for the archeological summary. It may be remarked that Clark (1953), pp. 53-55, records a Klamath legend of what purports to be this eruption.

4. The cultural position of the Klamath-Modoc has been variously assessed. Kroeber (1925), pp. 334-35, initially saw their position as essentially Californian; later (1939), p. 51, he removed the Northeastern Californian segment, including those tribes and the Achomawi-Atsugewi, to the Great Basin. Spier (1930), p. 233, saw Klamath material culture of Plateau type, with strong leanings toward northeastern California, their social system as of Northwest Coast, and their religious institutions of Northern California-Western Oregon, form. In his view, the Modoc inclined somewhat more toward California. Driver and Massey (1957), Map 2, place both peoples in the Plateau.

K
M
101
114
172

Ray alone has seen the differences between the two peoples as so great as to justify passing the California-Plateau boundary between them. Thus (1939), p. 148, he treats the Klamath as the southernmost of the tribes of the American Plateau, although one that exhibits variations stemming from California and the Basin; and again (1963), pp. v, xii, while conceding that the Modoc are highly divergent from the tribes of California, asserts that the Modoc "shared fewer culturally diagnostic traits with the Klamath than they did with the Achomawi." The latter statement seems at odds with the culture element survey of Wheeler-Voegelin (1942), p. 250, and remains to be sustained. Nonetheless, Ray has performed a useful service in correcting the view that Modoc culture was merely an offshoot of that of the already specialized Klamath.

Modoc NS17

Another stone implement is the single-grooved, flat-bottomed K 412
arrow straightener, such as is shown in pl. 21, fig. 9. A perforated wooden arrow straightener, of the form shown in fig. 5 of the same plate, is still used.

Implements of obsidian and of flint are common. Arrowheads K 411
and large spear points, as also knives which were formerly fitted
into wooden handles, are yet to be found. These points are found [172] •
by the Indians in various parts of the country where they have K
been used and left by former inhabitants. They are chiefly [755]
employed at present as charms in medicine and gambling. A [525]
gambler may take a large obsidian knife or spear point and, after
singing the proper song, place it under the large tule mat upon [304]
which the game is being played, to insure good luck. In addition to their use in medicine as charms they are also employed for purposes of scarification.

Stone pipes of several forms (pl. 22, figs. 8, 9, 10) are still K 276
used. The discoidal form shown in figure 10, which is quite unusual for the Pacific slope, appears to have been less used in aboriginal times than the obtuse-angled form shown in figure 8.

GAMES.

M
The Lutuami, like most aboriginal peoples, had many games K
for both adult and young. It will not be necessary to go into 524
details here, as the subject has been treated by Dr. George A. 114
Dorsey[a] and Mr. Stewart Culin.[b]

BASKETRY.

The basketry of the Klamath and Modoc, which is always M
twined, may be classified under two heads: soft or pliable basketry K
and stiff or rigid basketry. The former predominates very 285
largely and all the finer baskets are made in this manner. The materials used for this sort of basketry are as follows. The skin of the leaves of the cat-tail tule forms the white material which is used as the groundwork of almost all of the finer baskets. The M K [113]

[a] Certain Gambling Games of the Klamath Indians, Amer. Anthr., n. s. III, 14-27, 1901.

[b] Twenty-fourth Ann. Rep. Bur. Ethn., 136, 247, 291, 328, 479, 550, 659, 740, 1907.

773 As a result of their seclusion, all their geogonic and creation myths are
[776] acting around the headwaters of Klamath River and in Lost River Valley,
and the first man is said to have been created by their national deity,
K'mukámtchiksh, at the base of the lofty Cascade Range, upon the prairie
drained by Wood River. I have obtained no myth disclosing any knowledge
of the ocean, which is scarcely one hundred and fifty miles distant in
[192] an air line from their seats. They have no flood or inundation myths that
are not imported from abroad; and what is of special importance here, their
terms for *salt* (ā'dak, shõ'lt) are *not their own*, but are derived from foreign
languages.

173 There is an animal story embodied in the Texts, page 131, forming
773 No. II of the "Spell of the Laughing Raven," containing the sentence:
"Hereupon the Klamath Lake people began fighting the Northerners." I
believed at first that this contained a historic reminiscence of some intertribal
war, but now am rather doubtful about it. The song 192; 1 was
supposed by some Indians to be a very old reminiscence, while others
referred it to the presence of the Warm Spring scouts in the Modoc war.

I conclude from the foregoing facts that historic traditions do not exist
among these mountaineer Indians. If there are any, I was unable to obtain
000 them. The racial qualities of the Modocs, and still more those of the
É-ukshikni, indicate a closer resemblance with Oregonians and Columbia
River tribes than with Shoshonians and Californians.

B. ARCHÆOLOGIC REMAINS.

211 The Klamath people have not evinced any more propensity for erecting
monuments of any kind than they have for perpetuating the memory
[346] of their ancestors in song or tradition. In fact, structures the probable
[226] age of which exceeds one hundred years are very few. Among these may
be particularized the three ceremonial sweat-lodges and perhaps some of
the river-barrages, intended to facilitate the catch of fish, if they should
turn out to be of artificial and not of natural origin. In the Lost River
172 Valley is a well, claimed by Modocs to be Aishish's gift—probably one of
312 the large natural springs or wélwash which are seen bubbling up in so
many places upon the reservation Stephen Powers reports that near the

172 shores of Goose Lake, chiefly at Davis Creek, a number of stone mortars
3 12 are found, fashioned with a sharp point to be inserted into the ground, and that in former times Modoc, Payute, and Pit River Indians contended in many bloody battles for the possession of this thickly inhabited country, though none of them could obtain any permanent advantage.* Since the manufacture of this kind of mortars can not be ascribed with certainty to the Modocs, we are not entitled to consider them as antiquarian relics of this special people. The three sudatories and the river barrages are regarded as the gifts of Kmukámtch, a fact which testifies to their remote antiquity. Excavations (wásh) forming groups are found on many of the more level spots on the Reservation, near springs or brooks. They prove the existence of former dug-out lodges and camps.

C. LINGUISTIC AFFINITIES.

121 Anthropologic researches upon the origin of a people do not always
197 lead to decisive results as to the qualities of the primitive race of that people, for the majority of all known peoples are compounds from different races, and thus the characteristics of them must be those of a medley race. As to antiquity, language is second to race only, and much more ancient than anything we know of a people's religion, laws, customs, dress, implements, or style of art. Medley languages are not by any means so frequent as medley races, and less frequent still in America than in the eastern hemisphere; for in this western world the nations have remained longer in a state of isolation than in Asia and Europe, owing to the hunting and fishing pursuits to which the natives were addicted—pursuits which favor isolation and are antagonistic to the formation of large communities and states. This explains why we possess in America a relatively larger number of linguistic families than the Old World when compared to the areas of the respective continents. It also explains why races coincide here more closely with linguistic families than anywhere else on the surface of the globe. Instances when conquering races have prevailed upon other nations to abandon their

175

Frémont also remarked on the scarcity of their horses.[22]

Frémont reached Klamath lake again May 6, 1846. He commented on the outlet, Link river, "this is a great fishing station for the Indians." His statement on the distribution of their settlements coincides with my information. [231] [226]

> They have fixed habitations around the shores of the lake, particularly at the outlet and inlet [Williamson river], and along the inlet up to the swamp meadow [Klamath marsh], where I met the Tlamaths in the winter of '43–'44, and where we narrowly escaped disaster. . . . . The Indians made me understand that there was another large river [Williamson river] which came from the north and flowed into the lake at the northern end, and that the principal village was at its mouth, where also they caught many fish. [361] [131] [133]

Frémont's party made a circuit of the lake. It is curious that he does not mention the settlements about Pelican lake on the western side, which he could hardly have avoided. On the other hand it is not clear how closely his memoirs follow his diary. Attacked while on the western side, his party reciprocated by raiding a village on the opposite side, perhaps one of those on Williamson river just above the present highway bridge. [726]

> Behind the sage-bushes where they had taken their stand every Indian had spread his arrows on the ground in fan-like shape, so that they would be ready to his hand. . . . . Quantities of fish were drying, spread on scaffolds, or hung up on frames. The huts, which were made of tall rushes and willows, like those on the savannah above [Klamath marsh], were set on fire, and the fish and scaffolds were all destroyed.[23] [252] [342] [726]

The first invaders remembered by the Klamath came from the north about 1835. The stories about them have now a legendary flavor. The first group was mounted; the Klamath dubbed them mpĕ'tkoŋks (from mĕtc!a', to pack about) from their roving habits. An alternative name, pásai'ūks (French-Canadian in Chinook jargon), more surely identifies them. During their brief stay at the mouth of Williamson river they bought fat dogs of the Klamath, which to the latter's amazement, they ate. For these they gave buttons and metal disks with a central perforation (wika'lkal). 173 437 648

Almost as early was a white contingent moving northward on the west side of Klamath lake. The Indians watched them unseen. They were impressed with the horses, axes, and the food of the whites. 173 648 177

173 When the latter broke camp they left behind a little flour, which the
177 Indians carried home and divided. They rubbed it on their palms and
[302] smeared their faces.[24]

648 Other early whites came from the southeast on horseback. This
marked the beginning of the great migration by way of the Modoc
648 country to the Pacific slope. On the whole the Klamath came off
remarkably well in their relations with the whites. The full brunt of immigration was borne by Modoc and Pit River peoples. The Klamath were spared the Oregon wars of the fifties, which all but annihilated the tribes of western Oregon and northern California.[25] The earliest white settlements in the neighborhood were about the present Jacksonville, Medford, and Ashland. The first white settlement within Klamath territory was near the village of kowa'edi at the northern end of the lake. This was about 1860–65, hence may have reference to the first agency established there. Subsequent relations have been on the whole quite amicable. The Klamath took no part in the Modoc war of 1872–73.

Habitat

131 The territory of the Klamath is on the high plateau of eastern
133 Oregon, in the shallow basin wherein lies the group of lakes that give
rise to Klamath river. The southern half of this basin about lower Klamath and Tule lakes is Modoc territory, extending southward across the lava beds in the direction of Pit river. The northern half, which lies against the Cascade range, is the home of the Klamath.

The Klamath properly reside on Klamath lake (or as it was
formerly known, upper or middle Klamath lake), on Klamath marsh,
[361] and on Williamson river, which connects them. At least, most of the
permanent winter settlements are on these three waters, with a scattering on their tributaries. Summer camps are established over a much wider territory, as far, it would seem, as the natural limits of this drainage area.

---

[263] [24] Salt was equally unknown to them at this time.

[25] A somewhat obscure account was given me of the inclusion of Klamath in
[174] the great round-up of western Oregon Indians on Siletz (?) reservation in the
fifties. These had been wintering at the Dalles and were herded with the
[648] Indians there. The Upland Takelma and Molala were penned in together and fed by the soldiers. Some died every day; the Klamath suspected that they were poisoned. The Klamath were kept apart, and, thanks to the strenuous arguments of their chief Lalo'ka, were not only freed but supplied with beef and an escort of soldiery to conduct them back to their own country.

K 285
alternately tule and a small cat-tail (watcō'k), the wefts are cords made of the rolled outer layer of the tule (called ķ!o'sgi). These wefts are placed in pairs in simple tabby weave at intervals of one to three inches; they are not twined. The wefts are so thin and so tightly drawn that they barely show in the finished mat, but they produce a checkerboard effect (sölümtai') which gives this variety of mat its name. Possibly there is a fourth variety called ak!a'lōks, an open twined mat, but of this I am not certain. All these mats are provided with a border of twisted strands of the same material caught in the weft cords.

M 281
Blankets woven of strips of rabbit skin are made by Modoc, not by Klamath.

K 114 285 173
Coville states that "a long time ago the bark [of the cottonwood, kō-osh', *Populus balsamifera* L.], when peeled and split, was used in the manufacture of an Indian cloth."[313] What this fabric can be I do not know, unless bags are meant.

K 283
Ropes are made of three braided strands. The material is grass or the outer husk of the tule for such rough work as carrying wood. Strips of hide are sometimes used, but little elk hide is available for pack ropes. Finer cords, such as those for fish lines and nets, are made of nettle (sleta) bark fibers, of which there are three or four varieties (or perhaps phases). Other plant fibers, such as the Rocky Mountain flax (kōl'-ä-käms, *Linum lewisii* Pursh.)[314] make stronger cords. Brown and gray nettles are most commonly used because of their strength.[315] Swamp-grass cords are used for sewing mats. Barrett notes that string made of brown milkweed is but little used and that all string is formed of two strands twisted together.[316] The latter point is confirmed by my own observations. Cords are made by placing two strands, or a doubled strand, side by side on the bare thigh; rolling them separately under the palm by a movement up the thigh, and by a quick reverse movement down the thigh, without raising the palm, rolling one around the other. Cord-making is a woman's art. K [462]
A rope is called pěķ!os and cord gənū'ķs; braiding is k!əbō'k!a and rolling p'tc!Iŋ.

000 they are rather a cloddish, indolent, ordinarily good-natured race, but treacherous at bottom, sullen when angered, notorious for keeping Punic faith. But their bravery nobody can deny."*

THE PREHISTORIC PERIOD.

174 Before the middle of the nineteenth century the Mák̲laks people was unknown to mankind except to the nearest neighbors in Oregon and California. We are therefore justified in beginning its period of documentary history at that time, and in relegating to the domain of prehistorics all that is known of their previous condition. The information upon these points is furnished by three factors: tradition, archæologic remains, and language.

A. TRADITION BEARING UPON HISTORY.

121 Traditional folk-lore, when of the mythic order, generally dates from
773 an earlier epoch of fixation than historic traditions. The remote origin of *genuine* mythic folk-lore is sufficiently evidenced by the archaic terms embodied with it, by the repetition of the same phraseology for ages, and by the circumstance that all nations tend to preserve their religious ideas in an unchanged form. I am laying peculiar stress upon the term ***genuine***, for Indians have often mixed recent ideas and fictions with archaic, original folk-lore and with ancient mythic ideas, the whole forming now one inextricable conglomerate which has the appearance of aboriginal poetic prose.

173 The Klamath people possess no historic traditions going further back
769 in time than a century, for the simple reason that there was a strict law
688 prohibiting the mention of the person or acts of a deceased individual by
171 *using his name.* This law was rigidly observed among the Californians no
784 less than among the Oregonians, and on its transgression the death penalty could be inflicted. This is certainly enough to suppress all historic knowledge within a people. How can history be written without names?

[126] Many times I attempted to obtain a list of the former head chiefs of the two chieftaincies. I succeeded only in learning the names of two chiefs recently deceased, and no biographic details were obtainable.

174 This people belongs to the autochthonic nations of America, called so because they have lost all remembrances of earlier habitats or of migrations.

---

* Contributions to Amer. Ethnology, III, p. 253.

773 776 As a result of their seclusion, all their geogonic and creation myths are acting around the headwaters of Klamath River and in Lost River Valley, and the first man is said to have been created by their national deity, K'mukámtchiksh, at the base of the lofty Cascade Range, upon the prairie drained by Wood River. I have obtained no myth disclosing any knowledge of the ocean, which is scarcely one hundred and fifty miles distant in an air line from their seats. They have no flood or inundation myths that 192 are not imported from abroad; and what is of special importance here, their terms for *salt* (ā'dak, shō'lt) are *not their own*, but are derived from foreign languages.

173 773 There is an animal story embodied in the Texts, page 131, forming No. II of the "Spell of the Laughing Raven," containing the sentence: "Hereupon the Klamath Lake people began fighting the Northerners." I believed at first that this contained a historic reminiscence of some intertribal war, but now am rather doubtful about it. The song 192; 1 was supposed by some Indians to be a very old reminiscence, while others referred it to the presence of the Warm Spring scouts in the Modoc war.

I conclude from the foregoing facts that historic traditions do not exist among these mountaineer Indians. If there are any, I was unable to obtain 000 them. The racial qualities of the Modocs, and still more those of the É-ukshikni, indicate a closer resemblance with Oregonians and Columbia River tribes than with Shoshonians and Californians.

B. ARCHÆOLOGIC REMAINS.

211 The Klamath people have not evinced any more propensity for erecting monuments of any kind than they have for perpetuating the memory 346 226 of their ancestors in song or tradition. In fact, structures the probable age of which exceeds one hundred years are very few. Among these may be particularized the three ceremonial sweat-lodges and perhaps some of the river-barrages, intended to facilitate the catch of fish, if they should turn out to be of artificial and not of natural origin. In the Lost River 172 312 Valley is a well, claimed by Modocs to be Aishish's gift—probably one of the large natural springs or wélwash which are seen bubbling up in so many places upon the reservation Stephen Powers reports that near the

121 more useful dates and facts. Such results as these may be confidently looked for when several dialects of one linguistic family can be compared; and a careful comparison of one language with others spoken in the vicinity, belonging to the same or a different family, will always be attended with beneficial results for the increase of our scientific knowledge.

124 The aboriginal literary monuments printed below are authentic national
127 records of a brave and industrious mountain tribe of Indians. Ethnologic notices have at a comparatively early period been gathered concerning the Modocs and Klamath Lake Indians, but most of them were of doubtful scientific value, because the information was gathered from them in the English language, which they understood but very imperfectly. Even now, the dates and facts recounted by them, as well as by Indians of many other tribes, in English, are so extremely confused, that only texts written in their own language can give us a clear insight into their traditions, myths, and mode of thinking.

538 No Indian tribe possesses a history of itself reaching back further than two or three generations, unless it has been recorded by whites at an early date, and what goes beyond this limit is tradition, on which we must be careful not to place any implicit reliance. But mythology records in a certain sense the intellectual history as well as the metaphysical ideas of a people, and thus by the gathering of the numerous mythic tales and legends of the Máklaks a start at least is made for the investigation of their intellectual development. A very moderate estimate puts at several hundred the more generally circulated myths of the Klamath Lake or É-ukshikni alone, and the number of their popular song-lines, so interesting and unique in many respects, may be called infinite, for their number is increased every day by new ones. The bulk of their mythic folklore is of great poetic beauty, freshness, and originality, and, like that of other tribes, full of childlike "naïveté." This latter characteristic forms one of their greatest attractions, and the animal myths of every uncultured people will prove attractive, because they were invented for religious or poetic and not for
[173] didactic purposes. To some of the myths given below we may confidently ascribe an antiquity of over three centuries, for their archaic terms

538 and locutions, repeated from generation to generation, are not always understood
[173] at the present day by the young people, who most attentively listen to the aged rhapsodists, when they expound these miraculous stories in the lurid glare of the nocturnal campfire. Nothing in them indicates a migration of these upland tribes from any part of the country into their present homes, and hence the Mák̲laks must have had undisturbed possession of the headwaters of Klamath River for some centuries prior to the advent of the white population.

197 The various texts obtained clearly exhibit the character of the language
538 actually spoken and the difference existing between the two dialects,
124 but they do not all possess the same linguistic value. The texts of Dave Hill and others are worded in the conversational language of the tribe, which in many particulars differs from the more elaborate and circumstantial mode of speech which appears in the mythic tales given by
124 Minnie Froben. The "Modoc War" and some of the shorter pieces could be
126 obtained only by putting down the English first and then getting sentence for sentence in the dialect, whereas the best worded stories and specimens were written in continuous dictation. All texts obtained were carefully revised first with the informants, then with other natives, and all the necessary explanations added at the time.

533 From a purely linguistic view the popular songs or song-lines are the most valuable contributions. The melodies of some of their number deserve to be called pretty, according to our musical taste. To the natives all of them appear harmonious; but when the Western Indian calls some melody "pretty," guided by his musical principles, he very frequently does so in opposition to what our ear tells us to call by this predicate.

124 The Klamath Lake dialect was spoken by the majority of the contributors
191 to my linguistic anthology. I obtained these specimens, with the exclusion of the Modoc texts, in the autumn of 1877, at the Klamath Reservation, Lake County, Oregon. Though many of these natives speak the Chinook jargon more fluently than English, I never availed myself, for obtaining any information whatever, of that imperfect and hybrid medium, through which the Indians of the Northwest carry on so much of their intercourse.

NOTES.

[124] 16. Dave Hill took part himself in one of these skirmishes. His historical accounts are all given in the conversational style, which almost throughout substitutes the [175] simple *s* for *sh*. I have not been able to determine the exact dates of these Rogue River raids; but they must have occurred before the end of 1855, when the Oregon war broke out, for after its termination most of the Rogue River Indians were removed from their old homes to the coast reservations of Northwestern Oregon. The raids occurred in the early youth of Dave Hill, who was born about 1840; so they may be placed between the years 1848 and 1855.

173 *539 726 19

16, 2. tínatoks forms antithesis to tína of the preceding clause. The literal meaning of both is: "one time ..... the other time."

16, 3. Wálamsi. The suffix -i, -í, is the adverbial particle hí, and forms a *locative case*, mainly found in local and topographical terms, as in Yámsi, Kakágosi, Ktaíwashi; also in a few generic nouns designating localities, encampments, mountains, etc.

16, 5. shûshû'dshapĕlish. The suffixed -sh is the pronoun sha, *they*, and in this suffixed form also appears as -tch, -s. This verb stands in the distributive form; shúdshapĕll, to rebuild a fire, being the absolute form.

16, 7. nánχatch, for nánχa tchish, "others also".

16, 10. yákanuapkuk, verbal causative of the future of yákna. The forms yä'kna, yä'ka, yékna, yéka, are preferable to yákna, yáka.

[727] 16, 11. sá-atsa. It is a common custom among western, and some eastern, wild tribes to force their captives to dance in honor of the victory gained over their own tribe. This is done especially during the scalp-dances.

16, 14. Titná lû'ka, etc. Here begins the account of a raid made by the Rogue River Indians upon the Klamath Lake settlements. It may have occurred one year after the raid previously narrated.

16, 15. sapíya, etc. After escaping, he informed his own countrymen of all the local conditions of the Klamath Lake people and their country, and used all his topographical knowledge in guiding their warriors to the attack.

17, 1 and 2. Tsúi nĕ'lka. Indians and uncivilized races in all portions of the world begin their raids upon the enemy before dawn, or at the earliest appearance of daylight.

17, 9. gäkán and gekuánapka, inflectional metathesis for gäkná and gekánnapka.

17, 14. hushtchŏ'ktat for hushtchŏ'kat ät, ät (*ye*) being repeated twice.

17, 16. tsókapks tcha is a contraction from tsokápkash tchí'sh a.

17, 17. Tchíssa, for tchí sha: thus they.

17, 20. sellólok: synizesis of the longer form shéllualuk, shellualúga: through fighting.

17, 21. yuyálks=sítk, abbreviated from yuyálkish=shítko, looking like persons mourning over their lost companions, or made sorrowful by bondage to Indians of a foreign tribe.

few only there we enslaved. So I, when we quit (fighting), three times had been there.

NOTES.

197 19. The long and fertile valley of the Pit River, an eastern affluent of the Sacramento River, is inhabited by several tribes of Indians who speak dialects of the same language family. Of the peculiarities of these tribes, Stephen Powers has given the first comprehensive sketch in the Overland Monthly, 1874, pp. 412–416, and in Contributions to North American Ethnology, vol. III, pp. 267–274. The various tribes greatly differ in their physical and mental qualities. The Pacamallies, on Hat Creek, at the lower end of the valley, were much dreaded by peaceable travellers on account of their sudden attacks from an ambush. The Indians in Big Valley are a fleshy, stout, and physically well-made people, while the Hot Spring Valley people has become deteriorated through prolonged national misfortune. Against both of these the slaving raids of the Klamaths and Modocs were mainly directed.

721
567
727 19, 2. The raids were undertaken by the Klamaths and Modocs just before wókash-time; that is, in April and May. They had no other purpose than to make slaves of the females and children of the unwarlike, poor, and suffering Pit River Indians, and to keep them either at their homes or sell them for ponies, provisions, beads, etc., at the Dalles to the Columbia River tribes. Adult men were not enslaved, but killed outright if captured. Similar instances of suppression of weaker tribes of the West by warlike Indians who were their neighbors are those of the Kayuses on Middle Columbia River, of the Yuki between Sacramento River and the Pacific Ocean, of the Húpa on Trinity River, Cal., all of whom were, at the advent of the whites, the terror of the districts surrounding their homes.

648 19, 3. shläótak for shläóta ak; the Pit Rivers ran away at the *mere sight* of the Klamath men; k̲á-i tata siúkat, the Pit Rivers never killed any Klamath men. Both statements are exaggerations; Hill's own account and Toby Riddle's biographic notice tend to prove the contrary.

727 19, 3. nellínat, or nell'nat. When they had killed an enemy, they did not follow the custom of the Oregonians of taking the scalp. This custom is not found among any of the Central Californian tribes.

193 19, 4. hû'stchok̲-huya; by the suffix -huya, -uya, the action of the verb is shown to take place at intervals, or in a small degree. "They did only little damage by killing or massacring." Cf. sheuótank-huya, 20, 2, and -uya in the "List of Suffixes".

196 19, 4. tú'm tát sa. Change of the subjects introduced by the pronoun sha, sa, in consecutive sentences, is sometimes observed, as here and in 19, 16; 20, 3. Hill often uses sha when speaking of the Klamath Lake men, where nat, *we*, would be more appropriate.

193 19, 6. Kitchkanin nû for kitchkáni nû (or ni) nû. Pronouns and particles are repeated quite frequently.

19, 11. Wúksalks is a camping-place distant about six miles from Linkville. It was not possible for me to obtain definite information about the trail followed most generally in those raids, but Dave Hill said that from there they went due south. He

173 was born about the year 1840, and since he was a boy then, carrying only a pistol, this
*539 raid may have taken place about the year 1858. His second raid, which was under-
726 taken the year afterward, was made when he was nearly twenty years old. After this
he stayed five years in Oregon City, on the Lower Willámet River.

19, 16, and 20, 1. What is said here up to the word snawä'ds is evidently an anticipation of what follows in 20, 6. 7.

[192] 19, 16. sas tillindsa, or shash tiḷindsha: shash is apposition to wéwanuish, which stands here, as frequently, for wewanuíshash; 23, 5, we find: wewánishash.

20, 2. lápik for lápi gi: "two are, two were."

[487] 20, 9. Tiunō'leshtat. The distance between Klamath Marsh and the Pit River country was estimated at three days' Indian travel; but it often took four days to reach there on horseback.

[192] 20, 10 and 11. maklaksksáksi refers to the encampment and immediate surroundings of the Indian captors, the Klamath Lake men and the Modocs, who had gone with them.

[487] 20, 13. guhuáshktcha. They seem to have returned home over the same trail which they had followed in going south. They passed between Little Klamath and Rhett Lake, which latter is also called Tule and Modoc Lake.

[193] 20, 17. tsúi gé-u, etc. This sentence has to be construed as follows: tsúi gúikaka hú'k lû'gs spunísh gé-u: "hereupon that slave, transferred by me, ran away."

21, 2 and 3. Bóshtin tpä-ók. This man was an American settler on Lost River,
[648] who, with other settlers, had previously attacked one of the Pit River tribes, in punishment for depredations committed. In the fight which took place, some whites were killed by the Pit Rivers, and this prompted the abovementioned settler to slaughter an ox for the Lake men, in order to raise their spirits for deadly revenge on the common enemy. The beef was slaughtered and eaten at his farm.

21, 5. Tsúi nat, etc. This incident was explained to me by Dave Hill, as follows: The famous Captain George was at that time war-chief both of the Klamaths and the Modocs. He had ordered Kiukamtch, the head-man of the Nushaltkága-Modocs, to join the expedition against the Pit Rivers. His refusal to go prompted Dave Hill and others to deprive him of his elk-skin cuirasses; but finally, to secure success to the expedition, the parfleshes were returned to their owners.

[193] 21, 7. Húmasht nat. A verb like gi or shúta has to be supplied.

21, 12. séllaluish, translated here by "war-expedition", still retains its verbal nature; for it is connected with two temporal *adverbs:* lupi' and húnk. More circumstantially the sentence can be rendered: "we rode far beyond the terminal point of our previous raiding campaign."

[193] 21, 18. léwak, a verb composed of two particles. Gétak and kánktak, formed almost in the same manner, are also used as verbs. Below, léwak is separated into its two components by a pronoun: lä nät wák ka-á; lä' nät wák gatdsawiá-a.

21, 19. wéwansni. The terminal -ni turns the wéwanuish into a kind of adjectival phrase. See the peculiar use made of this ending in the Dictionary and in the Grammar.

22, 8. hátaktk. The final k is the verb gi, ki, "said"; tchin hátaktk is: tchí nû hátakt gi.

[302] 22, 21. shatchlχámia is one of the various modes of painting face and body in use among the western Indians. White paint was put on in this manner (see Dictionary) only when the Indians were on the war-path. From the same verbal base is derived

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

173 shatchō'lgi, to contract the half-opened hand or fingers. Compare also: shatχā'dsha, *539 shátuaχa, shátĕlakish.

726 **23, 6. gakayúluk** refers to the women, not to the Klamath men. These latter retired with the captured females to the top of a hill, to secure themselves better against further hostile attacks. shíshatχa, distributive form of shíatχa.

23, 11. tinkayúla. The Pit River men ran out of the timber to flee from further attacks, and some ran up the steep bank from the dry river-bed. While they did so, the Lake men surrounded them and completely closed the circle (shtá hashámpka). Nevertheless, some of them managed to break through the intervals; this frightened the Klamath men, and then the other Pit Rivers also escaped towards the hills.

23, 12–14. The three men and the boy who went up the hill belonged to the Pit Rivers. The Klamath Lake warriors were so surprised at their sudden return to their surrounded companions, that the Pit Rivers had an opportunity to escape during the confusion.

193 196 **24, 4. Nátak.** The sentence has to be construed: nátak híshlan hû'nk, Moatuáshash hû'nk ksápok. "None others but ourselves shot at him; though he was one of our men, we thought him to be a Pit River man".

24, 4. láki. He had been shot in the eye-bone.

24, 6. k̲lă'kat stands for k̲lii'ka at; cf. **28**, 12. gátpant for gátpna at.

24, 6. shewatχû'lal: for shewatχō'lash i, or shewatχō'lish i; the i appearing here not as a local, but as a temporal case-suffix. shewátχa, *noon*; lit.: the day divides itself in two; shewatχō'la, *afternoon*, the day has divided itself in two *a while ago*.

24, 8. luluksgī'-ish, uncommon form for lúluksgish, lóloksgish, *rifle, gun*, lit. "fire-maker".

24, 17. síukshtka stands for the full form síukshtka gi.

24, 18. tutī'la. By inadvertence the distributive form is used here instead of the absolute form tuíla, for the Pit River man spoken of had an abnormal fleshy excrescence on *one* foot only.

25, 1. shéllualshuk: he means fighting with the Pit River Indians.

25, 1. ndánnitaksni, incomplete grammatic form for ndannitánkshni.

25, 2. kinka-ak i, only a few; meaning females of the Pit River tribes.

É-UKSNI SÉLLUAL SÁTAS.

gave women to us those, of the Snake tribe horses also two. Then we returned here to Fort Klamath; but he Lieut. Small over there separated Goose Lake
guní'gstant gémpaluk Spá-ish Valleytála. Lā'p Sátas wéwanuish ä'na.
opposite for returning to Surprise Valley. Two Snake females he took with him.

NOTES.

28. The various bands of Snake Indians inhabiting Oregon east of the Cascade Mountains are gaining their sustenance chiefly by the chase. This accounts for their constant wanderings and ubiquitous presence sometimes at Camp Harney, or the Owyhee and Snake River, at other times near Warner Lake, or the Klamath Marsh.

The date of this raid could not be determined; it may have preceded the fight related below by ten or twenty years.

222
501
28, 1. É-uksi, "to Klamath Marsh"; on Williamson River (Kóke), which forms the outlet of the Marsh, the Snakes saw women of the Lake tribe crossing or passing down the river in their dug-out canoes, which they use for gathering wókash (the seed of the pond-lily) on the Marsh.

173 28, 2. gépkapsh, formed by syllabic elision from gepkápkash; cf. 29, 19.

*539 28, 2. sákatla, to come up, to arrive by the trail.

726 28, 3 and 4. wéwalüks pi'la, the old women only; the younger ones, on whom prin-
648 cipally devolves the work of wókash-gathering, found time to escape in their canoes
[193] from the raiders.

[192] 28, 4. k̲'lewidshápka. The men had gone fishing to distant places, leaving their
[222] females in the camp, not apprehensive of any hostile attack.

[192] 28, 8. kilō'́s, or k̲ilû's, is the epithet given to "Dry-Leg", the Snake chief; it means a bold fighter, leader of a fighting band; literally: "irate, wrathful", and may be here taken as an equivalent to "war-chief" (sessalólish lak̲í).

[193] 28, 13. Moádoki'sh, apocopated for Moadokíshash; also 28, 1: wéwannish (wé-
[192] wan'sh) for wewannishash (shläá gépkapsh). Nā'lsh tchi'sh, *us* also; that is, we of the
[657] Klamath Lake tribe, were gathered by Mr. Perit Huntington into one district, the newly
established Klamath Reservation. A large number of the Lake People were then scattered about Klamath Marsh, which is visited by them now in summer only for fishing, gathering wókash and berries, and for hunting.

[657] 28, 14. Dave Hill, now interpreter (lúldatkish) at the Klamath Lake Agency, took
[175] a part in this short but interesting expedition, in the capacity of an Indian scout. He
fixes himself the date of it by the words "tína illolólatko", or a *full* year after the Indians had been gathered on the Reservation by Mr. Perit Huntington. The treaty was concluded on October 14, 1864, and the campaign was undertaken in 1866 by a small body of American troops for the purpose of bringing back to the Reservation a band of Snake Indians who had run away from it. This unruly tribe, jealous of its former independence, has left the Reservation even since then, and could only after much exertion be induced to return. The fights took place west of Warner Lake, and north of the border-line between California and Nevada, within the former haunts of these western Shoshonis.

[175] The Report of the Acting Commissioner of Indian Affairs for 1867, page 99 sq., mentions this expedition in the following laconic terms: "October 27, 1866, troops consisting of 21 men, First Oregon infantry, and five Indian Klamath scouts, under Lieutenant Oatman, and 27 men, First Oregon cavalry, under Lieutenant Small, had a fight with a band of hostile Snake Indians near Lake Abbott [should read: Abert], in the Klamath country, Southern Oregon. The Indians had so chosen their position that the troops were obliged to dismount to attack them. The fight lasted one and a half hour, and 14 Indians were killed and many wounded."

On page 100 of the same Report, another fight against Snake Indians is spoken of: "Late in November, 1866, in a conflict between the troops and Snake Indians near Fort Klamath, 10 Snake Indians were killed by the troops, and three more by the friendly Klamath and Moadocs who accompanied them." This may have been the same fight as the one above, reported with much less accuracy of detail.

[103] 29, 3. Spá-ish Valley, name corrupted from Surprise Valley. This valley is situated in the northeastern angle of California, and on the shore of its two alkali lakes several American settlements have sprung up. A few Snake Indians live peaceably around Fort Bidwell, which is located at the northern extremity of the valley.

29, 10. tálaat t̲zalamti'tal, consonantic assimilation for tálaak t̲zalamti'tal, due west.

[192] 29, 17 and 19. nā'ts, natch, for nā'ls, nā'lsh, nā'lash, *us*; náts a gépksi, for nā'lash a gépkash f.

173
*539

726
248

29, 17 and 18. gayá-itsampk. The advance of the troops was ordered in consequence of Hill's report that Snake Indians had been seen by him and his fellow-scout.

[192] **29, 19. tû′=hak;** hak means: on this side of something or somebody, referring to an object located between the speaker and something more distant.

29, 19 and 20. shlä′pka (for shlä′apka) and tássuipk (for tássui-ápk) "they saw and attacked them in Hill's absence"; tínshampk "they scampered off unseen by Hill". If [193] [196] the simplex verbal forms shlä′a, tássui (or táshui), tínshna were used, they would imply that Hill then saw the Snake Indians himself, that he was among the troops charging them, and that he had seen them *in person* scampering off.

30, 3. lewé-ula really means: not to permit, not to allow, to forbid.

[192] **30, 3. tchín gi,** short for tchí ni gi: "so I said."

30, 5. Instead of **gatpánkshkshi** could also stand in the text: **gatpannápkshi**; the final -i being used in a temporal sense in both terms.

[193] **30, 8. kû′meta,** contr. from kû′mme tchish, or from kû′metat tchish.

30, 9. snashuála, etc. They piled up rocks to serve them as barricades to shoot from behind.

[192] **30, 11. u-l′tsna,** distributive form of ó-itchna; see Dictionary.

31, 7. Nä′wapksh, etc. Transcribed into the fuller and more explicit grammatic [193] [196] forms, this phrase would read: Nä′wapkash yamakíshtana kétcha tχálamna, "to the northwest of Goose Lake." For Nä′wapksh, Né-uapksh, see Dictionary.

31, 13. This campaign terminated in a decided victory over the runaway Snake warriors, but failed to accomplish its real purpose of bringing them back to the Reserve. Nevertheless, these Indians had been severely chastised by losing quite a number of men killed and wounded, and seven women of their tribe captured by the military.

NOTES.

823 I. This myth intends to explain the existence of the large number of rocks found at the locality called Shúyuχalkshi.

196 193 131, 2. K̲á-ak̲amtch. The adjectives -amtch, -ámtchiksh appended to animal names designate mythologic characters. Adjectives of an equal meaning occur in all the western languages, as far as these have been studied. Cf. *Note* to 126, 11. 12.

825 II. In this myth, as well as in other grizzly bear stories recorded in this volume, this bear is always killed, conquered or cheated by his quicker and more cunning adversaries. Nevertheless his clumsy form and narrow, ferocious intellect are very popular among the tribes, who have invented and still invent numerous stories to illustrate his habits and disposition.

103 131, 5. K̲íuti is the name of an Indian camping-place situated a short distance north of Modoc Point, on eastern shore of Upper Klamath Lake.

193 131, 6. hátkok qualifies shkû'lχa and yámnash is the indirect object of shûlû'tamantk. Shkû'lχa, nánuk yámnash shûlû'tamantko, wawakshnátko tchish: "he lay down to sleep, keeping all his neckwear on himself, and not taking off his moccasins." Shûlû'tamna can in other connections refer to the clothing, but here it has special reference to the beads.

131, 11. kti'ukuela. Tradition reports, that Old Grizzly was pushed over some of the high rocks at Modoc Point.

173 131, 13. Yámakishash etc. In these words may be recorded the reminiscence of an ancient fight between the Klamath people and some Northern tribe which had come South on a hunting expedition. A Klamath song-line given in this volume also recalls
*539 an ancient inroad made by the "Northerners". The grizzly bear represented the
773 Klamath tribe, the wolf the Northern Oregonians, perhaps as ancient totem signs; the
825 bear having been killed by an intruder, the Klamaths had to take revenge for the insult.

823 III. The object of this myth is to explain, among other things, the origin of the white spots on the head and back of the loon (táplal). But the myth as given in the

6

27. Some Historical Incidents

(Mrs. Aggie Butler)

539*
173•
648

(1) Now I will tell, something, a little to you [pl.]. (2) We Indians lived in the distant past, and we lived correctly [lit. "well"], not doing anything [bad]. (3) And there were many of us Klamath Indians living everywhere, all along the shores of the Lake.

(4) And once the white men attacked us old ladies gathering wokas. (5) And they almost killed there, shot some. (6) And he was among them—(Proper name)—he, [of] whom the white people are so very proud. (7) He was there with them. (8) And [he?] shot one of the women, in the face, and it showed.

(9) And some did not hide from them, and they left them alone in their winter-houses, living. (10) And the Indians, those Klamath men, were away hunting for some time, and on their returning [the women] told them. (11) And the women [told] them what the white people had done to them, and they almost tracked them, but they did not do anything again, to that white man.

(12) And then the Warmsprings people always used to quarrel with them, and having come, they made slaves, of the Klamaths. (13) And the Klamaths having tracked them, killed some, having taken the women back. (14) So thus the people of the old days always fought wars here. (15) And they [did] the very same way to the Pit River Indians, having gone, the Klamaths, and they enslaved their children too. (16) They raised them, however. (17) And some never went away from them, [for] they loved some of them. (18) They did the same thing to the Paiutes. (19) And they made slaves of the Paiutes also, and they grew up right there, so they live there today, those Paiutes who used to be slaves there.

[726]
[567]

(20) And the white people did evil to the Indians, and once that one called (Proper name), to the Rogue River Indians. (21) And that white man wanted all of them to dig, on his land. (22) And having dug something, then he killed some of them there, and threw them down into that ditch. (23) And he covered them [with] earth, the children too. (24) And one who escaped told of it. (25) And because of being thus at that time, when the Modocs made war [i.e., the Modoc War], then one of the chiefs spoke thus, "Let them not do it to us, as that (Proper name) [did] to the Pit River Indians awhile ago! (26) Perhaps they want to do the same to us. (27) They want to 'speak' to us Modocs in the same fashion,"

[TEXT CONTINUED ON PAGE 141]

that Modoc said once. (28) They never forgot it, [their] doing thus, 539*
[their] killing the Indians wrongfully [lit. "badly"]. 173●

(29) And I have only related little bits of it. (30) But I know a great 648
deal, but I am not telling all of it, however. (31)—How the Indians used
to fight amongst themselves, always they fought even among themselves. [721]
(32) Even among themselves they enslaved someone's child, and sold it. [567]
(33) That much is all I will tell. (34) I have nothing else to tell.

Introductory Note to Text 28

This text is a continuation of the foregoing by Mrs. Butler's sister. 124
Both are part of a recorded conversation about Klamath history in general, 128 and no particular attempt was made to formalize the texts into "stories." When Mrs. Butler had finished her historical narrative above, the topic turned to the Modoc War, and Miss Skellock began to discuss their father's role in that conflict. Rightfully, this text should include the remarks in English which led up to the Klamath portion, and also an explanation and continuation in English which follows it. Limitations of space require that these English parts be edited and abbreviated, however.

Introductory Remarks in English

"Our father was a scout in the Modoc War. He was with the white 539*
soldiers and went to those Lava Beds where the Modocs were." 726

648
173

28. Recollection of the Modoc War

(Miss Irene Skellock)

(1) My father went there, to the battleground. (2) And he was with the white men. (3) And he was a soldier—ah—a "scout." (4) And they were falling on both sides of him, soldiers. (5) And if they shot one, the soldier behind him marched up to the front. (6) However, they never shot him. (7) And he, however, was afraid of seeing (?) those Modoc Indians only. (8) So he lived in fear, thus they said, and some of those Klamath Indians who went with him, they also were afraid. (9) And that's all I'm going to tell [in Klamath].

[TEXT CONTINUED ON PAGE 143]

Concluding Remarks in English

"He said that whenever someone was killed in front of them they had to jump into their place. Oh, he said he sure was scared! He was with those white soldiers fighting the Modocs in the Lava Beds." 539* 726 648 173

Mrs. Butler adds: "He told how they had to go to the war, because they (the white people) told them that they'd take all the Klamath Indians away, if they didn't go. All those who went were related, since they didn't want them to take anybody away. Others, some of them, refused and took their canoes across to Pelican Bay. Some did not want to get into the war. One man, a good shot, said, 'I'm not going. I'm going to die! They can kill me right here. I don't want to go.' But they never took him."

29. Menstruation Practices

(Mrs. Pansy Ohles)

539* 841

(1) When a woman has her menstrual period, she does not come to eat because of menstruation. (2) [She] does not eat with us. (3) [She] does not bathe, does not get wet. (4) [She] will not get chilled. (5) [She] does not feel well, and does not put her hand in water.

30. The Second Coming

(Mrs. Pansy Ohles)

539* 776 787

(1) According to God's promise [lit. "rule"]. (2) All the earth will burn up. (3) And at that time God will return again.

[TEXT CONTINUED ON PAGE 145]

autobiographical incidents. The end of the tape arrived just as Mrs. Cowan was beginning to feel tired, and the conversation came to an abrupt end. 124

The tape has been considerably edited to remove false starts, English portions, fragmentary or unintelligible sections, and other such "noise." The author's questions were originally asked in broken Klamath, and this has been put into English in order not to give rise to mistaken statements about the language. As was done above, personal names have been omitted out of respect for the individuals involved. Utterances by different Klamath speakers are indicated by their initials, viz., AC, PO, and RC, and the author's utterances are marked by PB. 124 128

38. A Conversation (among several)

539*
124
[824]

(1) PO: Yes, little Coyote, on whom [Gmoḱaṁč] stuck those things—that we call cattails, which was the reason, his fur is bad.

PB: Do you know any myths?

(2) PO: Could you tell a myth to me? (3) I wonder if you would tell a myth?

(4) AC: I don't know how. I don't know how to tell myths.

(5) PO: Do you remember when the white men first came? (6) Do you remember that?

(7) AC: The girls [i.e., nurses] asked me there in the "hospital" thus, "How long have you lived, how long?" (8) So I said, "There were no white people here at all, when I travelled around here." [173]

(9) PO: How big were you, when the white men came? (10) How big were you, when the white men came—when you recall the white men coming for the first time. (11) How big?

(12) AC: Yes, I was big [i.e., "grown up"], big. (13) I know a lot. (14) I was big when they fought the war [i.e., the Modoc War], over there, across there. (15) I being big, I know a lot. (16) But there were no white people anywhere around here, there were none—thus I told those white people [i.e., the nurses]. (17) There were none. (18) Only we Indians were many around here, Klamath Falls people. (19) Many Indians' land this was, [I?] said. (20) "ʔo···," they said, "Yes..." (21) So I have lived so long, I said. (22) "You have lived a very long time," they said, "It was long ago, when there were no white people, long ago," they said to me, the girls there, from the "hospital."

[TEXT CONTINUED ON PAGE 159]

(23) PO: Would you tell something good, do thus (?) [at our] asking? 539*
(24) That's what he wants, this one, and he asked me thus, a little while 124
ago, "Why are there so many house-pits, on the Marsh? (25) Did they 173 •
live there at that time, even in the winter?" (26) And I said, "I do not
know." (27) Did they live there on the Marsh in the wintertime? [361]

(28) AC: Yes, all. (29) They lived everywhere. (30) Many there on the Marsh too, many lived all around it. (31) They lived [there] every day, even in winter. (32) And these Indians lived around here, many, the same way these [people lived] also up above, all the length of the river. (33) These living places were over there, those house-pits. [342]
(34) Thus (Proper name) said to me long ago, "What did this used to be?"
(35) So I said, "Our grandfathers used to live there, that—at that Ḉome·kai.
(36) The house-pit was on this side long ago, that of my Grandfather (father's father)." (37) Thus that (Proper name) told me. (38) It was there. (39) And they called [them] "ʔiwli·wakni·" that house-pit lies there, he told me. (40) And in that same way those (Proper name) are our grandfathers, as I told [her, i.e., the questioner mentioned above in Sentence (34)]. (41) So [she] said, "Yes, was it thus? (42) No one told me," [she] said. (43) "Yes, these were living places all around here, [103]
this, this was Q̇ačẃe·č, this mountain—the mountain was called Q̇ačwe·č."

(44) PO: What is that Q̇ačwe·č?

(45) It is something from the old times—some myth. (46) All of the mountains were named some way. (47) Thus said (Another proper name) long ago, "What is that ČniWi·ls? (48) ČniWi·ĺs, what is it?" (49) We do not know. (50) We did not name the mountains. (51) Thus mountains were named thus around. (52) Perhaps when God made this, He named the mountains, thus. (53) I asked many, old persons, and they did not know it. (54) Truly they did not know it, [and] I also do not know.

[TEXT CONTINUED ON PAGE 161]

(83) And did anybody tell this one the myth from over there, that is a good myth. (84) It is [about] Crater Lake. 539* 124

(85) PO: Probably no one. (86) I do not know it.

(87) AC: Yes, it is a very good myth [about] over there. (88) They told me something thus, that it was a very, very good myth. (89) However, [I] don't know it, because these [meaning her wits] are gone, being old. (Interruption.)

(90) AC: Thus he asked me, how they lived long ago.

(91) PO: Could you tell it?

(92) AC: Now he has stopped it [i.e., the machine].

(93) PO: Now he has done something—started it up again. (94) Now you can begin to tell, if you wish, anything at all. (95) Whatever you remember, tell that. (96) Now I have told it to you, and he will put it on there [i.e., on the tape]. (97) Now it is—something?—going—now it is revolving.

(98) AC: People were good, we Indians a long time ago. (99) We were good people. (100) And I have told my—we were good people long ago. (101) We took even a little bit of food [i.e., all we had] for [someone]. (102) And, even though there was no food here, then we took for [somebody], something. (103) And it was this. (104) And doing it thus it is called "They even divide up a flea." (105) Thus was the Indians' way. (106) Thus they used to call it. (108) To someone, even a little bit of food they took there. (109) Yes, for another, and they gave some food, even [though it was] from a small amount, even if there was no food, just being very sympathetic at that time. (110) Living with a great struggle [lit. "having become very tired"], they got food. (111) Yes, even old ladies like these went off to dig roots. (112) They slung [a basket] of this kind on their shoulders, and even the weak, now they knew that there would be nothing to eat in the winter. (113) And because of that, they buried some food. 539* 124 173* [431] [222] [251]

[TEXT CONTINUED ON PAGE 165]

539*
124

one] was ever angry?" (150) And he was never one who got angry. (151) He was good. (152) I told this one. (153) They were there at Q̓oWasdi, (Proper name¹), and (Proper name²), and—who—(Proper name³). (154) They were talking. (155) Someone else perhaps was talking too, whom they called "č̓opbaqs." (156) And they were laughing. (157) So I eavesdropped on them—I am an eavesdropper, as I told this one. (158) And he said to them, whether they had ever seen (Proper name³), being angry, or perhaps in a bad mood, or perhaps annoyed. (159) No, no [one] had ever seen [him thus]. (160) Then (Proper name¹) said, "But I have seen him angry once." (161) "ʔa···, when?" said that (Proper name³). (162) Then (Proper name¹) said, "When you were jerking at your horse's bridle!" (163) Then they roared with laughter. (164) Thus I told this one. (165) And I told June also, who always used to come and see you awhile back. (166) She is singing there, at Sheridan. (167) There where they call it thus, there where the Indians from all over are gathering. (168) She will sing there on Sunday, in the evening. (169) She must have arrived, there. (170) And she will sing dressed in a skin [dress], June. (171) She is my—my elder sister's daughter, who always comes to see you.

(172) AC: Yes, niece. (173) She is my [relation] on both sides. (174) I, her grandmother, to me—she considered me her little sister. (175) Yes, she called me her little sister, her grandmother. (176) So my picture of her which I was keeping, of the old lady, it is gone, someone has stolen it from me. (177) It is gone. (178) [I] thought to give it back [and] looked for it long ago. (179) I looked for it, but it was missing.

(The machine was temporarily turned off at this point.)

(180) AC: Moss [sp. *Evernia vulpina*].

(181) PO: (I never could think of that!) How was that black one called?

(182) AC: Moss [another species]. (183) They "ate" it, ate. (184) Having "roasted" it, having "roasted" it, they ate. (185) That black moss too, they ate it.

539*
124
262
173

[TEXT CONTINUED ON PAGE 169]

539*
124
262
173

(186) PO: I saw Little Fire [woman's name] eating it long ago—moss.

PB: What do they call a fern?

(187) PO: How is a "fern" called? (188) That which they mix in with flowers, it grows like flowers, but has no flowers. (189) "Fern," that which the white people call "fern." (190) I can't show you any.

(191) RC: That which they always used to get there on Smith River. (192) That which is something—only foliage.

(193) PO: Which are large, it grows very long.

(194) AC: "čya·wisam," perhaps?

(195) PO: How?

(196) AC: It is "čya·wisam." (197) Yes, [they] eat its leaves like wokas, which are red, those leaves.

(198) PO: No.

(199) RC: Which are long ones.

(200) PO: The like of which we put on top [of a grave]—mixed in with flowers. (201) They are only those long, long leaves. (202) Perhaps having gotten some somewhere, we can show you, sometime.

(203) RC: Before [going] there to the graveyard, people used to get flowers, and then they mixed in that sort, which are long, long leaves.

(204) AC: Those which you [pl.] call "sunflowers"?

(205) PO: No.

PB: Then what would you call sunflowers?

(206) PO: "Sunflowers," I don't know.

(207) AC: Yes, now I have forgotten it. (208) How was it called—but that was applied [lit. "long object put on"], it was medicine, sunflower roots. (209) To be applied, the ones underneath. (210) Having thus become sick, [one] rubs it on oneself, the roots.

PO: Those are the sunflower roots, but she can't remember the sunflowers.

PB: And did the Klamath eat the sunflower seeds?

(211) PO: Did we used to eat that sort?

(212) AC: Yes, they were eaten, good, those seeds. (213) And they were just like sifted [wokas], the seeds. (214) They were "lopi·li·nas." (215) Having roasted them, the pod pops up, little black ones. (216) And only the seeds being thus, like sifted [wokas]. (217) [They] tasted good. (218) Yes, the Indians ate everything, all. (219) "Popping" it all

[TEXT CONTINUED ON PAGE 171]

539*
124
173
262

well, that wokas, tule eyes [i.e., tule roots], as they called it, white like this. (220) It was popped. (221) Indians ate everything, everything, they lived thus long ago. (222) And they lived well, they dug [roots] like this also, the Indians' potato [Sagittaria latifolia]—the Indians' "sweet potatoes." (223) Good, sweet, looking thus inside. (?) (224) But it was round, good.

PB: And what is "qlańe"?

(225) AC: "qlańa," yes. (226) It was good, even as food. (227) "Parsnips"—this just like a peeling [skin? membrane?] it bloomed. (228) Yes, it blooms just like "parsnips," but it smelled bad, that. (229) Smelled bad —it was "poison." (230) But it had blooms thus, blooming just like qlańa, however that stink of parsnips was not there [i.e., she here is speaking about "poison parsnips"—"sḱawanksam"]. (231) That was poison parsnips [Cicutum douglasii], bad. (232) It bloomed just thus, thus, like "qlańa." (233) But that "qlańa" was good—tasted good, sweet. (234) Good to eat raw also, and [as well as] having boiled and "cooked" it. [252]

PB: What did the Klamath call "garlic" or "onion"?

(235) PO: Which the white people call "onion," or "wild onion."

(236) AC: That is "pni." (237) It is from over there, something good like that. (238) They were little, like little "turnips," bitter. (239) They were in bunches. (240) They grew over there, to the east, here. (241) At Ya·ńi there. (242) [I] wanted Ransom to go and get some, to plant them, on some dry earth like this in the ground—thus there are many, many bright flowers. (243) They are good flowers. (244) However they are just like those onions, smelling just so. (245) But they have called them "pni." (246) They ate it well, the Paiutes. (247) It tasted good, sweet, having put it in a roasting pit, they "roast" it. (248) With all its skin having done thus to it, they ate it.

PB: Could you tell me what a "wa·l" is?

(249) PO: What was that "wa·l"? (250) "wa·l"! (251) "He didn't give his Granny the big 'wa·l'!"

[TEXT CONTINUED ON PAGE 173]

9: Barker L-5 (1955-1957) 1963

NR10 Klamath NR10

(252) AC: "wa·l"—it is good also. (253) My mother always used to find it somewhere, I don't know how long it thus was. (254) They were this big, here. (255) However, [they] were long, tapering, that "wa·l." (256) It tasted good. (257) I do not know it, I never followed her around long ago, when she dug that kind. (258) But she dug [for roots] knowing everything. (259) I do not know it, that "wa·l" thus.

539*
124
[173]
[262]

(260) PO: Its name is all I know. (261) They told [about it] in myths for [us].

(262) AC: It tasted just thus. (263) It was very good thus. (Interruption, and the machine was turned off.)

(264) PO: . . . "ksegi·." (265) Why would they say that? (266) "He 'ksegi·' me," as [they said].

(267) AC: Here, close by, I am deaf now!

(268) PO: "ksegi·"—why would they say that, "He 'ksegi·' me," as [they said].

(269) AC: When he lived with me. (270) If I would live with you, there at your place, then you would say, "She always 'ksegi·' me." (271) Thus you would say.

(272) AC: Then there is one more even, just about like it. (273) "nčegi·."

(274) PO: Didn't I [tell] you so! (275) "nčegi·!"

(276) AC: "nčegi·," that is one even. (277) "Now I will take offence [i.e., "nčegiwapk"] at him." (278) "Now [I] will quarrel [with him]. (279) For a long time I ignored him, but now I take offence. (280) So now I will take offence."

(281) PO: How did you [say] it first? (282) How would I say it, if you lived with me?

(283) AC: "ksegi·."

(284) PO: (That last one means I never paid any attention for a long time, but I will now, take offence to what this other person says and quarrel with them or fight with them or whatever.) So I know it for the first time, having become so old. (Interruption.)

PB: What is a "pḱa·sip"?

(285) PO: Which is that something—Grandfather [mother's father] and Grandfather [father's father]? (286) On the father's side, or perhaps on the mother's side? [601]

(287) AC: Yes, he is on the mother's side, that "pḱa·sip." (288) And he is on the father's side however, the "bloksip." (289) The "pǫ́oli·p" is

[TEXT CONTINUED ON PAGE 175]

174 161 The Klamath numbered 3000 in the historic period, the Modoc not so many. This is the testimony of Tom Lang, yet the number is much too large. Palmer[18] put their number at 415 in thirteen villages in 1854, but his list of villages indicates that he counted only the ä'ukckni (Klamath marsh) division. This would be about eighty-three families, a reasonable average of six houses to a settlement. At the time, however, the Klamath were said to be considerably reduced, and I was told of twenty-nine or more ä'ukckni settlements dating from this period, and said to be all occupied at the time. Yet, as no great epidemic was reported, it is doubtful that the population had been diminished by half. Possibly the occupation of the sites was more seasonal than I was told: a movement to Klamath marsh in summer, returning to the warmer Williamson valley in winter. Assuming a partial reduction and some fluctuating occupation, we may arbitrarily set the ä'ukckni at half as many again, say 600. The ä'ukckni settlements numbered half of the total and my informants' impression was that in population they were as many as all the other divisions together. This would mean that the Klamath as a whole numbered only 1200. Palmer's figure would give a mere 800, and the evidence of the settlements, a possible 2000. Our twelve hundred is not far from that of Kroeber, who set the combined Klamath and Modoc population at 2000, two-thirds of them being Klamath.[19] Mooney's estimate of 800 seems low.[20]

Early Contacts with the Whites

175 Contacts with the whites date back to 1825 or somewhat earlier. In 1826–27 Peter Ogden spent two months among the Klamath.[21] His first meeting with them seems to have been on Klamath marsh.

> Wednesday, 30th Nov. [1826]. Course south to Clammitt River [Klamath marsh?] 25 miles from River of the Falls [Deschutes]. Mr. McKay proceeded ahead to an Indian village distant 3 miles. It was composed of 20 tents built on the water approachable only by canoes, the tents built of large logs shaped like block houses the foundation stone or gravel made solid by piles sunk 6 ft. deep. Their tents are constantly guarded. They regretted we had opened a communication from the mountains. They said "The Nez Percés have made different attempts to reach our village but could not succeed. Even last summer we discovered a war party of Cayuse and Nez Percés in search of us; but they did not find us. Now they will have yr. road to follow. We have no fire arms. Still we fear them not. [131] [361] [342] [721]

173 When the latter broke camp they left behind a little flour, which the
177 Indians carried home and divided. They rubbed it on their palms and
[302] smeared their faces.[24]

648 Other early whites came from the southeast on horseback. This marked the beginning of the great migration by way of the Modoc
648 country to the Pacific slope. On the whole the Klamath came off remarkably well in their relations with the whites. The full brunt of immigration was borne by Modoc and Pit River peoples. The Klamath were spared the Oregon wars of the fifties, which all but annihilated the tribes of western Oregon and northern California.[25] The earliest white settlements in the neighborhood were about the present Jacksonville, Medford, and Ashland. The first white settlement within Klamath territory was near the village of kowa'cdi at the northern end of the lake. This was about 1860–65, hence may have reference to the first agency established there. Subsequent relations have been on the whole quite amicable. The Klamath took no part in the Modoc war of 1872–73.

Habitat

131 The territory of the Klamath is on the high plateau of eastern
133 Oregon, in the shallow basin wherein lies the group of lakes that give rise to Klamath river. The southern half of this basin about lower Klamath and Tule lakes is Modoc territory, extending southward across the lava beds in the direction of Pit river. The northern half, which lies against the Cascade range, is the home of the Klamath.

The Klamath properly reside on Klamath lake (or as it was formerly known, upper or middle Klamath lake), on Klamath marsh,
[361] and on Williamson river, which connects them. At least, most of the permanent winter settlements are on these three waters, with a scattering on their tributaries. Summer camps are established over a much wider territory, as far, it would seem, as the natural limits of this drainage area.

---

[263] [24] Salt was equally unknown to them at this time.

[25] A somewhat obscure account was given me of the inclusion of Klamath in the great round-up of western Oregon Indians on Siletz (?) reservation in the
[174] fifties. These had been wintering at the Dalles and were herded with the Indians there. The Upland Takelma and Molala were penned in together and fed by the soldiers. Some died every day; the Klamath suspected that they
[648] were poisoned. The Klamath were kept apart, and, thanks to the strenuous arguments of their chief Lale'ks, were not only freed but supplied with beef and an escort of soldiery to conduct them back to their own country.

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

The western and southern limits of the range are easiest to define 101
because of the topography and the proximity of other tribes. To the 131
east and north the open deserts and broken country extend indefinitely. 133
The nearest of the shifting settlements of Northern Paiute on the east
at Goose and Summer lakes are sixty and more miles from Klamath
lake. Those of the Warm Springs tribes are one hundred and fifty
miles distant, more than halfway across Oregon. Teit's data show [175]
that more than a century ago the neighbors of the Klamath in this
direction were the Sahaptins at no great distance and beyond them
Molala and Cayuse.

The wide plain south of Klamath Falls seems to have been unoc- 101
cupied. The Modoc lived south of the Lost River hills about Tule lake 131
and on lower Klamath lake. My Klamath informant doubted that 174 •
they lived on Miller lake, or had permanent settlements on Lost river.
Both tribes congregated at one place only for the early spring fishing,
namely on Lost river, a mile or more below the buttes at Olene. The [226]
Klamath camp site is on the north bank, the Modoc on the south.

The southern boundary of Klamath territory skirts the Klamath 101
valley from this place as far downstream as Spencer creek, near the 131
California-Oregon line, below the canyon of the Klamath. Below this
on the river are the Shasta, whose northernmost outposts are on Shovel
creek and north of the river on Jennie creek. The Klamath have no [226]
settlements on the river, but fish, hunt, and gather roots at such points [224]
as Keno, Spencer creek (ma'lbuķ'is), and at laik'ĕlmi, five or six miles [222]
upstream from Dorris (?).

The western boundary is the Cascade watershed, including, however, territory on the northwest side of Mount Pitt (Mount McLoughlin) and again southwest of Crater lake. The Klamath hunt northwest of this conspicuous mountain in a region of many streams called la'ndjli (possibly an American name). Fifteen miles southwest of Crater lake is Huckleberry mountain (iwumkă'ni, huckleberry place) where the Klamath meet the Molala similarly engaged in berry picking. The latter regularly occupy the highlands of the upper Rogue river drainage above Trail creek or some point below Prospect. These Molala form a southern extension of that tribe from the upper Umpqua drainage.

The northern and eastern boundaries are somewhat indefinite. Palmer stated:

The topography directs Shasta attacks against southern settlements. Coming by the open country along the Klamath river, they attack iwau'wōnᴇ at Klamath Falls, sometimes swimming the river there. Or they cross by the little island to the south to surprise the settlement on the east bank. Many years ago a large body of Ya'mŏkkni, northerners, descended on the Klamath on Sycan marsh in the northeastern corner of their territory. These may have been marauding bands of Shoshoni and Bannock, fought by the soldiery of Fort Klamath in the summer of 1864.[43] Henry Renier, an old settler, told me of Indians coming south about 1876 or earlier by way of the Warm Springs country from the Snake river range east of Lewiston, Idaho.

Northern Paiute scouts use various calls in order to keep contact with one another, imitating the crow by day, coyote in the evening, and owls at night; unlike Klamath scouts. When these are heard, women and children take to canoes, staying on the water until morning. The screech owl is thought to call, kŏkᴇdĕ'l aḳiu'ki'u, who sent me? A thrush (sḳo''lĕ) names who is coming, wī'mpis ᴇge'pkwa, they are coming.

[727]

Klamath hunting in the Cascades might meet Upland Takelma from across the range. On one occasion (perhaps about 1850) a party of five or six was wiped out with the exception of a boy who made his way at night, arriving footsore at Klamath marsh. Those who fetched the bodies for cremation found that the Takelma had taken scalps, hands, and feet as trophies. Two of those killed were brothers to the maternal grandfather of my informant, Coley. A wife of this grandfather was an Upland Takelma woman, perhaps a slave, who was a sister to the Upland Takelma chief Tŏḳtŏ'ḳli 'red). They killed her in revenge. She had been living among them at the marsh for years but had no children. The reciprocal raid can be reconstructed from Gatschet's information[44] and my own. The expedition was undertaken at the call of Lᴇle'ks, the most prominent ā'ukekni chief and a distant relative of Coley's grandfather. Men of all the tribelets took part. Crossing the mountains on foot, they found the Takelma encamped in Molala territory at the head of Rogue river. They attacked as the Takelma rose at dawn, scalping many and carrying off women and children. Among those killed was Tŏḳtŏ'ḳli, whose hands and heart they took. After the man was shot, Lᴇle'ks lanced him through the throat. Lᴇle'ks invited all the Klamath to a huge scalp dance at Klamath marsh. During the dances a wife of Coley's grandfather danced about with the heart in her teeth. The captives were dragged by their arms and forced to dance close to the fire.

A preparatory performance, called nī'ḳĕba, is an indispensable preliminary to a raiding party. It can hardly be styled a war dance,

---

[43] Gatschet, 1:lxii.

[44] *Op. cit.*, 1:16.

strand as wefts.[384] Designs, at least, are formed with wefts of cane 285
(t'k!ōp) and dyed tule (mo'ḳwas). Only the outer layer of the cane 291
is used; this is yellowish-white. This strip is flat, and being stiff, cannot be twisted; the tule weft being fully flexible, wraps around both warp and cane weft. The effect is unique; at alternate warps the cane weft appears passing horizontally, at the others the tule weft makes a wrapped stitch over warp and cane weft (fig. 15). Due to the technique the tule weft lies flat like a ribbon. Women's hats bear designs. Men's hats have none, but when the hat is completed the part covered by nettle weft (the central portion of the top) is painted. The brim of a man's hat is entirely woven with wefts of dyed tule (and cane?).

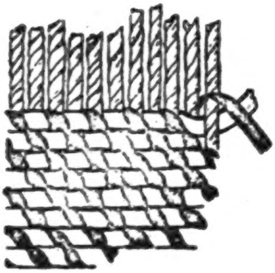

Fig. 15. Modified simple twine stitch of basket hats.

The several structural parts of such twined baskets are named. 285
The area of weaving at the center of the base, with which the basket is begun, is called dzle'lūḳs; the base of the basket, tse'lalwIs; the rounding margin of the base as it merges into the side, sto'li; and the turned-back warps of the rim, wo'lgōtk. Twining in general is lĕtca'; specifically this is simple twine. A twine stitch over two warps is la'pwiōmnōtk (lap, two); over three, ski'tgaltantk; over four, wuni'bäntka lĕtc!a (wuni'p, four). It is possible that ski'tgaltantk means three-strand twining rather than three-warp diagonal twine. There is no name for open twine construction, so far as I know. It may be called gIga'ŋka, many holes (from gI'nḳa, hole). Cat-tail cord for wefting is solō'tepas; such cord is wrapped around the hand to make a roll for storage. Warps (of the tule only?) are called twäch.[385]

---

[384] Coville (Notes, 94) states that in former times the bark of the aspen (vō'-lāl, *Populus tremuloides* Michx.) was used to make hats. [114]

[385] Coville (Notes, 92) also notes the use of the rush (tsin-ā-ō, *Juncus balticus* Willd.) in the weaving of light baskets. [174]

K
301 length is "a little too much." The unit, according to one informant,
is the length of the extended left arm to the upper end of the humerus,
or across the chest in addition to the point of the right shoulder. The
other gave the unit as a doubled string from the extended left hand
K
to the sternum; that is, a fathom. One thing is clear, that there is
[436] no great concern for dentalia as money, as among the lower Klamath
tribes. The strings are not standardized either as to length or size of
the individual shells. Long dentalia are more valuable than the short,
but my informants never knew anyone to argue over the precise length
of a shell. Both men agreed that the several kinds of beads, or at
least the best, are not worked by the Klamath, but come from the
K
south. They are either found in raided Achomawi-Atsugewi camps
[721] or are traded from these people or possibly the Shasta. Both were
[439] certain that the shells are not obtained from the north. This is something of a puzzle, because the Columbia river people have dentalia and
[177] use them extensively in trade. Furthermore, the ultimate point of
origin of the shells is the coast of Washington and British Columbia.
[174] The discrepancy in the statement is further accentuated by the Yurok
statement that the shells came to them both along the coast and down
the Klamath river.[309]

K
Finger rings are not made, nor bracelets, except for young children.
[189] The cast skin of a water snake is wrapped around their wrists
so that they will swim well.

K
Face painting is general, a daily usage, not confined to gala events,
302 but more obvious at that time. The shaman's body is painted red
during his winter performances. Red is the color in general use,
[756] white only at dances, and black alone in mourning. Those who go to
[822] war paint themselves red, not black, with their faces white. I have
pointed out elsewhere[310] that red paint is associated with warfare by
the Basin tribes and their Californian and Arizonan neighbors. Here
it may be added that black is used by Plains warriors. At dances
white pigment, found along the creek banks, is smeared on the palms
K
which are then pressed on the face or on a woman's smooth hair to
[317] form patterns. Red paint is difficult to get. It comes from a few
localities in the mountains near Crater lake. The Northern Paiute
NP
are said to have quantities of it, however.

[317] In winter women smear their faces, hands, and arms with a mixture of charcoal and pitch, or deer grease, or of pitch and grease

(ca. 1860-1900) NR10 Klamath NR10

177 At least one minor element, assigned by tradition to this period,
535 was derived from another direction; the notched rattle used in war
534 and scalp dances in imitation of the Upland Takelma.

Direct contact was opened with the Upper Chinook at the Dalles
only after 1800. By this time Snake raids had dispossessed the
• 174 Sahaptins of central eastern Oregon, driven them north of the
648 Columbia, and cleared the south bank of that stream by scattering
Cayuse-Molala east and west. Direct contact quite across Oregon
brought the Klamath in touch with the great trading center at the
Dalles and revealed to them the superior and stimulating cultures of
the Chinookan tribes and the semi-Plains groups from above on the
Columbia.

174 The whole rise of the chiefs, the growth of social stratification
177 based on wealth, the concern with slave-holding, all seem to date from
this time Wealth began to be considerable: its form was new: horses
[556] and slaves. Chiefs grew in wealth and prominence over shamans.
The basis of their selection changed in some degree from war to wealth.
[622] Slave-raiding to the south increased in frequency: the booty was
carried to Warm Springs and the Dalles.

[721] It is doubtful if the material differences in wealth and slave-
[567] holding existed prior to 1800. Shamans were dominant over chiefs
and were but slightly more wealthy than the majority. The historic
174 tribal subdivisions were in existence, the village groups and their dis-
tribution established, and the basic social relations, as reflected in kin-
177 ship terminology for example, much as we know them. Marriage may
[756] well have been by purchase, but possibly without the pseudo-potlatch
custom of reciprocal visiting. Material culture was prevailingly
[622] southern Plateau in aspect, and religious practices, while more north
[619] Californian, had already some impress of the Northwest Coast.

[583] Is there a Lutuamian culture province? I am doubtful. Kroeber
has somewhat hesitatingly posited one, set off by a certain distinctive-
101 ness from that phrasing of Northwest Coast culture found localized on
the lower Klamath river, and favoring rather the Basin and Plateau,
105 to which the Klamath country lies open.

114 "The Lutuamian culture or subculture, as represented by the Klamath and Modoc, corresponds well with this setting. It reveals some specializations, such as its wokas and tule industries, that are obviously founded on peculiar environment. There are some northwestern influences, but rather vague ones. The basis of the culture is perhaps central Californian, with certainly some Great Basin or

* 171 in conformity with northwestern views. The sense of obligation was
[591] weakly developed; the levirate was a mere custom, the sororate rare;
birth of heirs played no part in their scheme of things. In brief, the
[587] Klamath derived the sense of social standing based on wealth from
[583] the northwestern center, and the mechanism of marriage purchase to
effect it, but no more.

• 174 I am not inclined to indulge in an historical reconstruction of the northwestern marriage complex. But if it be in order, it seems better to suggest that the ancient, undifferentiated custom was the practice of mutual giving, subsequently formalized with the growth of concepts of wealth and rank on the Northwest Coast. The alternative is to hold that these attitudes and practices diffused from that center only after they attained full flower there. If this were so we should expect to find the specific forms of Northwest Coast procedure at a greater distance. I am very doubtful that ideas and sentiments diffuse as such, though I may have given that impression in some of the summary statements above. It seems rather that particular practices are imitated, and if but imperfectly copied or made rational in their new context, then alone do we say that merely the underlying idea has been borrowed.

* 171 In the present case social stratification based on wealth had spread
174 over a wide area; wife purchase with it. I conceive that members of
the imitating tribes observed the aggrandizement that went with
583 wealth and took occasion among their fellows to insist on a similar,
554 and in their eyes proper, respect for themselves and their wealth
when opportunity offered. The spread of the marriage purchase cus-
556 tom must have been one of the most effective mechanisms for the
spread of the sense of rank. Boas has already made such a case for the Kwakiutl and their neighbors. By marriage with the northern tribes among whom privilege concepts were highly developed, the Kwakiutl obtained these privileges through their wives.[667] The mechanism is clearly transparent in the Klallam preference for marriages to the north.[668] We are not told this of other tribes, to be sure, but it appeals to me that marriage into foreign tribes where payment for their women was demanded would inevitably bring in its train the notion that these women were in some way superior to those at home. This view is not drafted from thin air; among the tribes of Puget sound, e.g., the women of the more northerly tribes consider them-

selves the superiors of those among whom they are resident. Once the 171*
sentiment had become lodged in the group its fruition was made inev- 174
itable by the imitation of others. 583

With Kroeber, who has so expressed himself on the subject of the 554
Yurok,[389] I do not believe that the levirate and sororate were born of 556
this special development of purchase. Both customs have a nearly
universal distribution in North America. It seems rather that such
existing practices were drawn into the developing marriage complex
of this area.

SOCIAL STRATIFICATION

The background for a study of social stratification has been laid 128
in the preceding section. I will here deal with chieftainship, its
relations to wealth and heredity, and related topics.

Social stratification was but weakly developed among the Klamath. 554
Social standing did not depend directly on heredity and there was 556
apparently little difference in wealth from richest to poorest. Since
wealth was inherited there was at least some stability to family stand-
ing. The marriage purchase gave respectability to the union; it did
not fix the standing of the couple by reason of the amount paid. Yet [56]
there was some differentiation based on wealth, a continuous gradation
from the wealthiest to the slaves.

The wealthiest individuals were called lō'ki, rich men. This was 556
also the term by which chiefs were styled. My interpretation of the
Indian's statements is that those prominent individuals, who exer- 622
cised functions which would elsewhere have led to their being called
chiefs, were at the same time the wealthiest. A chief became such
primarily by successful leadership in war, coupled with some back-
ground of spirit power, wealth, personal qualities, especially ability
as an advisor, with some suggestion of hereditary interest.

The chiefly functions emphasized were leadership in war and 622
haranguing the people. The chief could not issue injunctions, he re- [70]
ceived no tribute, and was in no way responsible for the conduct or
debts of his people. Just prior to reservation days there was intro-
duced from Columbia river the practice of chiefs sitting as judges. [565]

While chiefs were set off from the mass, this did not imply any
sense of caste stratification. Their wives and children were not known
by a distinctive class term.

(ca. 1860-1900)

• 174 622 756 Every evidence points to the recency of the rise of chieftainship among these people. It is doubtful that material differences in wealth and slave-holding existed prior to the opening of direct contact with the Columbia river tribes after 1800. Even then chiefs were of relatively minor importance. The shamans were the great men and the wealthiest, easily eclipsing the chiefs. As an instance I have cited the difficulty of obtaining the names of chiefs of pre-reservation days, whereas shamans are well remembered. It is clear that some of the local groups did not have chiefs. The relative dominance of the shaman persisted until reservation days. Prior to this time chiefs were barely differentiated leaders of the Great Basin type.

Basis of Chieftainship

* 171 622 565 554 The Northwest Coast tribes stood in sharp contrast to this simple social scheme. There existed a caste system, a division into aristocracy, commoners, and slaves. While the relative ranking was continuous from the noblest aristocrat to the meanest commoner, there was nevertheless a well defined consciousness of distinction between the grades. This aristocracy was based on lineage and wealth. Its highest members were the chiefs, ordinarily the wealthiest persons. Yet a chief might lose wealth but retain his rank by reason of his birth. Within each community were several chiefs of the first rank whose authority extended hardly beyond their immediate retainers. Their advice was followed rather than their dictates obeyed. They were, however, among the Kwakiutl, for example, the recipients of gifts from their followers, not so much by reason of right as to bespeak their future aid and to enrich them to the further glory of the whole group.[480]

A definite caste system of this type is traceable southward from British Columbia through coastal Washington and Oregon at least as far as the Alsea. It has been noted, for example, for Klallam, the Puget sound tribes, Chinook, Wishram, and Alsea. It did not appear in the interior among the upper Fraser river tribes, nor in eastern Washington as among the Okanagon and Middle Columbia Salish, nor in eastern Oregon among Klamath, Modoc, and Northern Paiute. At the southern extremity of this area of distribution a somewhat different situation prevailed. There was no rigid caste system, but differences of wealth were considerable and on these social standing

The northwestern type of speaker was known among Klallam, Quin- 171*
ault, and Wishram, and probably to all the intervening tribes.[575] 537
Their presence may also be suspected in coastal Oregon, for their
functions would have been quite consistent with the social sentiment 622
there. Some positiveness is lent to this by the presence of what seems to have been a chief's speaker among the Rogue river tribes participating in the treaty negotiations of September 10, 1855. It is recorded that the chief spoke to a man who shouted his words to the assembled warriors.[576] Certainly the speaker was absent in northwestern California. On the other hand, Drake's description of the Coast Miwok in 1579 makes it certain that the speaker was a recognized functionary further south.[577] The Basin type of word for word repeater occurred over a wide area, having been recorded for the Nez Percé, the Sahaptins of Priest Rapids on the Columbia, Southern Maidu, Paviotso (Northern Paiute), Kaibab Paiute (?), and Havasupai.[578] Something of the sort might have been expected among the Klamath; they share, however, a substitute, the shaman's speaker, with the northern California groups.

Slavery

Slave-raiding and slave-holding may not have developed among 174
the Klamath until the coming of the horse and the opening of a slave 567
traffic with the Columbia river tribes in the early nineteenth century.
It is probable that prior to that time there was only the mild interest
in holding captives found among their southern and eastern neigh-
bors. Their slaves were captives of war. Slave-holding and the meas- 171*
ure of wealth in terms of slaves were characteristic of all north-
western people. These were everywhere taken in war and sold. Slave- 567
holding of this type prevailed not only in western Washington to the Columbia but southward through Oregon (Tillamook, Alsea, Takelma, Upland Takelma,[579] and Shasta). Coos and others of western Oregon should undoubtedly be included. Slavery is not mentioned in Teit's account of the Middle Columbia Salish of eastern Washington, and does not appear consistent with their general mode of life.[580] Directly

*171 southward of the Klamath there was no slavery; this is certain for 567 Northern and Southern Maidu,[561] and very probably Achomawi, Atsugewi, and Northern Paiute. This seems generally true of California with the exception of the northwest (Yurok and probably their neighbors), where there was debt slavery, but where slaves were not measurable articles of wealth.

Summary

101 105 • 174 The general position of the Klamath in relation to surrounding tribes was in earlier days the simple social structure of the Basin peoples. Since the opening of the last century they have borrowed from the Columbia tribes some sense of social stratification based on wealth, slave-holding, and trading, enhanced importance for their chiefs coincident with a change in the basis of selection from war to wealth, and quite recently judicial functions for the chiefs. There was thus a shift in social dominance from shaman to chief.

GIRLS' PUBERTY RITES AND WOMEN'S OBSERVANCES

*171 562 881 787 It is characteristic of western America that adolescence ceremonies were held for girls rather than boys. This is not to ignore the wide extension of the guardian spirit quest, more regularly performed by boys than girls, nor the boys' initiation ceremonies of southern California and the Southwest, but the boys' activities were less commonly ritualized save in the southwestern sector. The boys' quest among the Klamath has been discussed in connection with shamanism.

The girls' rites in the west can best be understood with reference to a background of women's observances throughout the continent. *171 841 Certain features of women's behavior had a well-nigh universal distribution. The general conception was that woman during her periodical illnesses was a source of contamination to others or a peril to herself. A series of restrictions ensued; she was secluded or her movements restricted during the period. For her own well-being she must fast or at least refrain from fresh meat or fish, but the latter proscription was also rationalized as avoiding damage to the food supply, especially fishing. She must not touch hands to face or hair, using instead a scratching stick, must not wash nor arrange her hair, and must dispose of her garments before resuming her normal life.

000 they are rather a cloddish, indolent, ordinarily good-natured race, but treacherous at bottom, sullen when angered, notorious for keeping Punic faith. But their bravery nobody can deny."*

THE PREHISTORIC PERIOD.

174 Before the middle of the nineteenth century the Máklaks people was unknown to mankind except to the nearest neighbors in Oregon and California. We are therefore justified in beginning its period of documentary history at that time, and in relegating to the domain of prehistorics all that is known of their previous condition. The information upon these points is furnished by three factors: tradition, archæologic remains, and language.

A. TRADITION BEARING UPON HISTORY.

121
773 Traditional folk-lore, when of the mythic order, generally dates from an earlier epoch of fixation than historic traditions. The remote origin of *genuine* mythic folk-lore is sufficiently evidenced by the archaic terms embodied with it, by the repetition of the same phraseology for ages, and by the circumstance that all nations tend to preserve their religious ideas in an unchanged form. I am laying peculiar stress upon the term *genuine*, for Indians have often mixed recent ideas and fictions with archaic, original folk-lore and with ancient mythic ideas, the whole forming now one inextricable conglomerate which has the appearance of aboriginal poetic prose.

173
769
688
171
784 The Klamath people possess no historic traditions going further back in time than a century, for the simple reason that there was a strict law prohibiting the mention of the person or acts of a deceased individual by *using his name*. This law was rigidly observed among the Californians no less than among the Oregonians, and on its transgression the death penalty could be inflicted. This is certainly enough to suppress all historic knowledge within a people. How can history be written without names?

[126] Many times I attempted to obtain a list of the former head chiefs of the two chieftaincies. I succeeded only in learning the names of two chiefs recently deceased, and no biographic details were obtainable.

174 This people belongs to the autochthonic nations of America, called so because they have lost all remembrances of earlier habitats or of migrations.

---

* Contributions to Amer. Ethnology, III, p. 253.

802 171 The numeration system of a people is a relic of a remote age, and therefore of importance for tracing the ancient connections of tribes. The quinary system is the most frequent counting method in America, and often combines with the vigesimal. The pure quinary system prevails in Ara, in the Chimaríko, Yuki, and in the Shasti-Pit River family, in Sahaptin and Wayíletpu, and it is also the system found in Klamath. Curiously enough, the Maidu Indians count by fifteens, and the decimal system forms the basis [801] of the Wintún, Mutsun, and Selish dialects. The mystic or "sacred" number occurring hundreds of times in mythologic stories is *five* among all the Oregonian tribes.

197 To sum up the result of the above linguistic inquiry, it may be stated that our present knowledge does not allow us to connect the Klamath language genealogically with any of the other languages compared, but *that it stands as a linguistic family for itself.* It has adopted elements from the tongues spoken in its neighborhood; and a common element, chiefly pronominal, underlies several of these and the American languages in general.

THE HISTORIC PERIOD.

'Εκ δὲ τοῦ καὶ μικρὰ πάντα πάμπολλα γίγνεται.

174 175 127 On account of the superstition previously alluded to, the traditional historic lore which forms so attractive a feature in the unwritten literature of the nations east of the Rocky Mountains and of Mexico is wanting entirely among the Máklaks, and we have to rely upon the meager reports of travelers and Government agents for accounts of the condition of the tribes in the earlier part of this century. Such notices of historic events are as follows:

000 According to a tradition recorded by Stephen Powers, an epidemic of small-pox broke out among the Modoc Indians in 1847, by which one hundred and fifty individuals perished.

The earliest historic conflict which can be ascertained with some chronological accuracy is the massacre of eighteen immigrants to Oregon by individuals of the Modoc tribe, and Ben Wright's massacre, consequent upon that bloody deed. The massacre of the immigrants occurred at a place on Tule or Rhett Lake, since called Bloody Point. Undoubtedly this was only

The Klamath numbered 3000 in the historic period, the Modoc not 174 161 so many. This is the testimony of Tom Lang, yet the number is much too large. Palmer[18] put their number at 415 in thirteen villages in 1854, but his list of villages indicates that he counted only the ă'ukckni (Klamath marsh) division. This would be about eighty-three families, a reasonable average of six houses to a settlement. At the time, however, the Klamath were said to be considerably reduced, and I was told of twenty-nine or more ă'ukckni settlements dating from this period, and said to be all occupied at the time. Yet, as no great epidemic was reported, it is doubtful that the population had been diminished by half. Possibly the occupation of the sites was more seasonal than I was told: a movement to Klamath marsh in summer, returning to the warmer Williamson valley in winter. Assuming a partial reduction and some fluctuating occupation, we may arbitrarily set the ă'ukckni at half as many again, say 600. The ă'ukckni settlements numbered half of the total and my informants' impression was that in population they were as many as all the other divisions together. This would mean that the Klamath as a whole numbered only 1200. Palmer's figure would give a mere 800, and the evidence of the settlements, a possible 2000. Our twelve hundred is not far from that of Kroeber, who set the combined Klamath and Modoc population at 2000, two-thirds of them being Klamath.[19] Mooney's estimate of 800 seems low.[20]

Early Contacts with the Whites

Contacts with the whites date back to 1825 or somewhat earlier. 175 In 1826–27 Peter Ogden spent two months among the Klamath.[21] His first meeting with them seems to have been on Klamath marsh.

> Wednesday, 30th Nov. [1826]. Course south to Clammitt River [Klamath marsh?] 25 miles from River of the Falls [Deschutes]. Mr. McKay proceeded ahead to an Indian village distant 3 miles. It was composed of 20 tents built on the water approachable only by canoes, the tents built of large logs shaped like block houses the foundation stone or gravel made solid by piles sunk 6 ft. deep. Their tents are constantly guarded. They regretted we had opened a communication from the mountains. They said "The Nez Percés have made different attempts to reach our village but could not succeed. Even last summer we discovered a war party of Cayuse and Nez Percés in search of us; but they did not find us. Now they will have yr. road to follow. We have no fire arms. Still we fear them not. [131] [361] [342] [721]

[411] [231] They are well provided with bows and arrows. They have only one horse. Snow is so deep, horses perish for want of food. In winter, they live on roots. In summer on antelope and fish.

December 1st. 30 Clammite Indians paid us a visit: fine men in good condition, but wretchedly clad. They say the river to the ocean is far distant and beaver they do not know. They say the Indians become more numerous as we advance to the ocean. . . . .

[342] [161] [439] Tuesday 6th. Reached Indian village of five huts, but large size square made of earth flat on top the door at the top a defence against arrows but not balls. 200 of them collected about our camp and traded 4 days. The 2 chiefs delivered traps lost by Mr. McDonald last year with 8 beaver. This is much in favor of their honesty. On our march this day, we passed the camps from wh. Mr. McDonald turned back last year and are consequently strangers to the country in advance.

[161] Thursday 8th. About 300 Indians around our camp. We advanced 6 miles south following the river south. I estimate the Clammitte nation 250 men.

Monday 12th. Reached the lake [Klamath lake?] 1⅛ × 15 miles well wooded with maple and hazel; course S.

[361] The second visit on record is that of Frémont, who reached the northern shore of Klamath marsh on December 10, 1843. He saw smoke at what appeared to be the middle of the marsh and along the opposite shore. An unoccupied northern shore agrees with my own information. The following day he visited the village "in the middle of the lake (or savannah)," which appears to be one of those at the outlet of the marsh.

[342] The huts were grouped together on the bank of the [Klamath] river, which, from being spread out in a shallow marsh at the upper end of the lake, was collected here into a single stream. They were large round huts, perhaps 20 feet in diameter, with rounded tops, on which was the door by which they descended into the interior. Within, they were supported by posts and beams.

[226] [252] [285] [291] Almost like plants, these people seem to have adapted themselves to the soil, and to growing on what the immediate locality afforded. Their only subsistence at this time appeared to be a small fish, great quantities of which, that had been smoked and dried, were suspended on strings about the lodge. Heaps of straw were lying around; and their residence in the midst of grass and rushes had taught them a peculiar skill in converting this material to useful purposes. Their shoes were made of straw or grass, which seemed well adapted for a snowy country; and the women wore on their head a closely woven basket, which made a very good cap. Among other things, were parti-colored mats about four feet square, which we purchased to lay on the snow under our blankets, and to use for table cloths.

[231] Numbers of singular-looking dogs, resembling wolves, were sitting on the tops of the huts. . . . .

[648] They made us comprehend that they were at war with the people who lived to the southward and to the eastward; but I could obtain from them no certain information. . . . .

This morning the camp was thronged with Tlamath Indians from the southeastern shore of the lake. . . . .

Frémont also remarked on the scarcity of their horses.[22]

Frémont reached Klamath lake again May 6, 1846. He commented on the outlet, Link river, "this is a great fishing station for the Indians." His statement on the distribution of their settlements coincides with my information. [231] [226]

> They have fixed habitations around the shores of the lake, particularly at the outlet and inlet [Williamson river], and along the inlet up to the swamp meadow [Klamath marsh], where I met the Tlamaths in the winter of '43–'44, and where we narrowly escaped disaster. . . . . The Indians made me understand that there was another large river [Williamson river] which came from the north and flowed into the lake at the northern end, and that the principal village was at its mouth, where also they caught many fish. [361] [131] [133]

Frémont's party made a circuit of the lake. It is curious that he does not mention the settlements about Pelican lake on the western side, which he could hardly have avoided. On the other hand it is not clear how closely his memoirs follow his diary. Attacked while on the western side, his party reciprocated by raiding a village on the opposite side, perhaps one of those on Williamson river just above the present highway bridge. [726]

> Behind the sage-bushes where they had taken their stand every Indian had spread his arrows on the ground in fan-like shape, so that they would be ready to his hand. . . . . Quantities of fish were drying, spread on scaffolds, or hung up on frames. The huts, which were made of tall rushes and willows, like those on the savannah above [Klamath marsh], were set on fire, and the fish and scaffolds were all destroyed.[23] [252] [342] [726]

The first invaders remembered by the Klamath came from the north about 1835. The stories about them have now a legendary flavor. The first group was mounted; the Klamath dubbed them mpĕ'tkoŋks (from mĕtc!a', to pack about) from their roving habits. An alternative name, pásai'ūks (French-Canadian in Chinook jargon), more surely identifies them. During their brief stay at the mouth of Williamson river they bought fat dogs of the Klamath, which to the latter's amazement, they ate. For these they gave buttons and metal disks with a central perforation (wika'lkal). 173 437 648

Almost as early was a white contingent moving northward on the west side of Klamath lake. The Indians watched them unseen. They were impressed with the horses, axes, and the food of the whites. 173 648 177

---

[22] Frémont, Narrative, 122.

[23] Frémont, Memoirs, 483, 484, 494.

101 131 133 [175]

The western and southern limits of the range are easiest to define because of the topography and the proximity of other tribes. To the east and north the open deserts and broken country extend indefinitely. The nearest of the shifting settlements of Northern Paiute on the east at Goose and Summer lakes are sixty and more miles from Klamath lake. Those of the Warm Springs tribes are one hundred and fifty miles distant, more than halfway across Oregon. Teit's data show that more than a century ago the neighbors of the Klamath in this direction were the Sahaptins at no great distance and beyond them Molala and Cayuse.

101 131 174 [226]

The wide plain south of Klamath Falls seems to have been unoccupied. The Modoc lived south of the Lost River hills about Tule lake and on lower Klamath lake. My Klamath informant doubted that they lived on Miller lake, or had permanent settlements on Lost river. Both tribes congregated at one place only for the early spring fishing, namely on Lost river, a mile or more below the buttes at Olene. The Klamath camp site is on the north bank, the Modoc on the south.

101 131 [226] [224] [222]

The southern boundary of Klamath territory skirts the Klamath valley from this place as far downstream as Spencer creek, near the California-Oregon line, below the canyon of the Klamath. Below this on the river are the Shasta, whose northernmost outposts are on Shovel creek and north of the river on Jennie creek. The Klamath have no settlements on the river, but fish, hunt, and gather roots at such points as Keno, Spencer creek (ma'lbuḳ'is), and at laik'ĕlmi, five or six miles upstream from Dorris (*1*).

The western boundary is the Cascade watershed, including, however, territory on the northwest side of Mount Pitt (Mount McLoughlin) and again southwest of Crater lake. The Klamath hunt northwest of this conspicuous mountain in a region of many streams called la'ndjli (possibly an American name). Fifteen miles southwest of Crater lake is Huckleberry mountain (iwumkä'ni, huckleberry place) where the Klamath meet the Molala similarly engaged in berry picking. The latter regularly occupy the highlands of the upper Rogue river drainage above Trail creek or some point below Prospect. These Molala form a southern extension of that tribe from the upper Umpqua drainage.

The northern and eastern boundaries are somewhat indefinite. Palmer stated:

159
701 revenge. While he was swimming in deep water at du'kwa he found a human leg in his grasp; it had been given him by the ghosts.[40] Then he became
721 "mean," revengeful, and led his people down the lake to iu'ˣlaloŋx for vengeance.

He grew aggressive and attacked gu'mbōt, kowa'edi, and other towns. He was a hard man to hit; they could not kill him in open battle. His du'kwakni
159 band went up Williamson river to the ā'ukekni town at bʀzūkse'was. Before the fight opened, Po'moks, an ā'ukekni from far up Sprague river, came
701 to him and announced that he would join him. Kō'ḳdiŋks agreed because he was a relative. During the battle Po'moks slipped behind Kō'ḳdiŋks and shot
726 him. That was the only way they could beat him; since then there has been no feud with du'kwa.

Quite in accord with Klamath custom, Kō'ḳdiŋks band was accompanied by a du'kwa shaman named ĕkts'as. When one of his side was shot, this shaman ran to him, extracted the arrow, and sucked the wound.

726 Pat's uncle of gu'mbōt and Nancy's father of du'kwa went to iu'ˣlaloŋx where they killed a man.

Some gu'mbōt men went to Buck island and killed a man there. Immediately a party followed them back and killed a man at gu'mbōt.

A brave man from du'kwa lived at gu'mbōt. The gu'mbōtkni traveled with him to kill iu'ˣlaloŋkni, ā'ukekni, and kowa'edikni. He stole women everywhere, carrying them to gu'mbōt as his wives. He tried to kill some gu'mbōt men whom he accused of tampering with them, but they dispatched him. After he was cremated all these women returned to their homes.

An attack might be expected at any time. The Upland Takelma (Ha'nis or Wa'lūmskni), for instance, raid the Williamson river district. Crossing by the ridges south of Crater lake, they travel down the ridge separating that river from Klamath lake. From this eminence they can see the smokes of a large part of Klamath territory. Gatschet describes such a raid, plausibly dating it between 1848
175 and 1855.[41]

726 The Takelma descended on bʀzūkse'was in the middle Williamson valley at salmon fishing time. Most of the warriors were away at Klamath marsh to welcome some northern Indians. Crossing the river the Takelma attacked at dawn, killing a few old people, but they were put to rout by the fierce onslaught of but five cuirassed Klamath, men of nilûksi, the Modoc Point district. They were pursued by the whole force of Klamath, hastily summoned from the marsh. Some escaped, others were found dead of starvation or wounds where they had hidden in the mountains.

Five old women were once left behind at Klamath marsh to gather lily seeds. They brought their canoes down to the falls, as far as they could go. All they could not carry they buried there to leave through the winter. A Paiute lurking on the opposite bank followed them down to the falls. He killed all five with his arrows. When their relatives found them overdue, they went to search. The Paiute, having stayed in the neighborhood to steal horses, was tracked and killed.[42]

---

[40] So my informant said, but she surely meant spirits.

[41] The Klamath Indians, 1:16–18.

[42] Gatschet records a similar Paiute raid on Williamson river or perhaps the same (1:28).

755 patella. One is allowed to burn completely; when the other is half-consumed the sufferer destroys it with a pinch and throws it away, telling it to carry off the pain. The dry bark of the black sage is used for this, chewed and shaped into conical pellets. One informant showed me some prepared from the sage-brush bands used by mourning women and deposited in the trees, which he had gathered. Another informant denied that such bands alone are used.

Rheumatism is also treated with skunk grease rubbed into the affected part and the flesh of the animal eaten.

Earache, deafness, and hemorrhage of the ear are treated by the application at night of poultices of cooked wild parsnip root.

Toothache is kima'dj p'an, ant eats, or literally düt ansma'sᴇ. It is so called because on breaking an extracted tooth they find in it a little worm with a black head, believed to be the larva of the ant, which has been eating the tooth. The sufferer rests his aching face on a stout stick, a paddle for instance, while he sleeps. Some one strikes the paddle a sharp rap; the sleeper is frightened and the aching gone. Pat Kane ascribed this to the Klamath marsh-Williamson river division (ă'ukckni) alone. The river-mouth people's (du'kwakni) method is to chew a bit of rotten fish, holding it on the aching tooth. The cure of the Pelican bay group (gu'mbŏtkni) is a cautery over the spot "breaking the tooth." Nancy denied the last two methods. Teeth are never extracted.

751 The Klamath used dog flesh in order to avoid smallpox (gotķ!ŏks, erupting) on at least one occasion. This was during a winter before the birth of my informants, now in their seventies. Many died because they had so few dogs. Ordinarily dog flesh is avoided, but on this
[177] occasion the flesh was eaten and the grease rubbed on the body. Considering the date[188] it may well be that this was a cure learned from French half-breeds on the Columbia.

278 For mumps, the root of a plant called sķŏssķŏtkgla'ks is rubbed on the swelling. (This waist-high plant grows near the river, is blue topped, with large green leaves.) Mumps has no native name because of its recency.

For colds the root of the yayo'ķaķ plant, found in the mountains, is chewed and swallowed. A poultice of this is also applied to a swelling, then covered with pitch.

---

[175] [231] [188] Powers states that about 1847 smallpox killed 150 Modocs (Tribes of California, 254). This is the widespread epidemic of that date which led to the Cayuse uprising against the Whitman mission in southeastern Washington (Hodge, Handbook of American Indians, 1:224). Taylor mentions its presence on the Humboldt and Bear rivers, Nevada, prior to 1853 (Taylor, Oregon Bound, 147, 155).

- 175

[For information on the history of the establishment of the Klamath reservation, see categories 648 and 657.]

Introduction

[P. XV]

DURING THE LAST HALF OF THE NINETEENTH CENTURY THE RESERVA- 121
tion came to be regarded by Indian policy makers as an instru- 657*
ment for directed culture change, depending for its success upon 648*
effective control over the governed and the selective modification of their culture toward that of the dominant society. The following pages detail the manner in which that policy figured in the transformation of several Indian societies in south-central Oregon, who came collectively to be known as the Klamath Tribe.

If we are to see the reservation in perspective, we must know its local antecedents. It is essential to know something of the aboriginal past from which the Indian signatories had sprung and of the modification in their lives wrought by the period of contact prior to their treaty agreement to enter upon reservation life. To isolate the contractual parties, Indian and white, from the events of settlement, tribal dislocation, and cultural confrontation that made the reservation a desirable solution for both would deprive the decision of its historical import. In the same way, it would be misleading to examine the reservation as if it
existed in the isolation that was part of its ideal character. When (175) •
Treaty Commissioner Huntington wrote in 1867,

> The design of the Government is to segregate the Indians upon lands set apart for them, separate them from the pernicious influences which association with whites entail upon them, and to cultivate the good, moral, and intellectual qualities they may possess.

he was outlining a situation that proved difficult to maintain.

It is within the frame provided by this policy that the history 121
of the Klamath Tribe falls most readily into segments. The first 175
period ranges from the aboriginal threshold to the treaty of 1864 657*
648*

3:Stern E-4,5 (1949-1957) 1965 NR 10 Klamath NR 10

121 and the formation of the reservation. For the next twenty years,
• 175 until the General Allotment Act of 1887, the control of the
* 657 Agency proved most effective, perhaps in part because the most
* 648 violent eruption, the Modoc War of 1872-73, polarized loyalties and removed dissidents. From the time of allotment in severalty, control over the course of change began to abate the effectiveness of Agency supervision; and with the opening of the reservation to massive commercial lumbering in the second decade of the twentieth century it declined rapidly. In the final years, until the termination of the reservation by law in 1954, the Agency did little more than preside over a population which, in essential respects, had passed beyond its power to control.

By that account, Agency rule was on the wane for some seventy of the ninety years which the reservation lasted, and was disputed by a war during the first decade. However, effective supervision was maintained longer in some areas than in others; and some powers, rather than lapsing, were passed on to local state, county, or municipal agencies. As a result, the picture is not to be summed up along a single dimension, but like history everywhere, must be seen in detail.

TWO

[P.22]

The Frontier Condition

726 FOR MANY YEARS THE SETTLEMENT OF THE WILLAMETTE AND CO-
648 lumbia valleys bypassed the tribes of the Klamath Basin.[1] In-
175 directly, however, they felt the first remote influences, as the
Sahaptin-speaking tribes of the middle Columbia, equipped with the superior weapons of the trading posts and mounted on horses acquired from the Shoshonean bands to the south, began to raid up the Deschutes Valley to take Klamath slaves.[2] The Klamath
[231] were at a disadvantage: in 1826 Peter Skene Ogden, of the
[411] Hudson's Bay Company, found them with but a single horse and uneasily awaiting raids by joint parties of Cayuse and Nez Percés; and even by midcentury they had only one firearm among them.[3] The scantiness of the local beaver made their territory of little interest to the company, however, and they came to enjoy a reputation as fierce warriors which preserved them
[101] for some time from settlers. Nonetheless, they were known even then to the tribes of the Columbia, for Ogden applied to them a name, "Clammite," that was not their own and seems to stem from Chinookan.[4]

648 Some ten years after Ogden passed through, a party of French-
175 Canadian trappers made their way into the region and on their return to The Dalles took along some Klamath.[5] From that time on, contact with the tribes at that great Indian trading center increased. Klamath parties moved down the Deschutes Valley, making their way either to The Dalles itself, or branching westward down the north fork of the Santiam along what came to be known as the Klamath Trail, through the settlement of the northern Molala, thence to the Kalapuya on the outskirts of
648 Oregon City. There, in 1843, one missionary recorded the visit
567 of "a large party of the Clamath tribe, fierce and warlike . . .
439 with about twenty slaves, [who] sold most or all of them. Some,
435 I was informed, were sold for three horses each,
175 some cheaper."[6]

I was informed were sold for three horses each, some cheaper."[6] 000

In the changing conditions of the early nineteenth century, K
the Klamath were caught up in currents generated from without. 175 •
The advent of horses and of firearms made it possible for the 177
tribes of the east-central Plateau, the eastern Salish and eastern 648
Sahaptin, to cross the Rocky Mountains, to hunt buffalo and [231]
enter into relations, both peaceful and bellicose, with the tribes [411]
of the Plains. As they came under Plains influence, the appeal K
of Plains garb, of parfleches and tipis, grew.[7] The Klamath were [291]
attracted to these new goods, and the clothing at least came to [556]
replace or supplement traditional forms of wealth.

Moreover, the horse and the gun had revolutionized warfare K M
patterns. Although traditional enemies beyond the Cascades 175
were preoccupied with white settlers, on the east the Paiute were 177
gradually developing mounted bands of great mobility and 726
striking power. The Klamath and Modoc were not slow to seek 231
the new instruments of war. 411

The opening trade to the north brought a corresponding K M
intensification of the raids carried south into the territory of the 175
Pit River tribes—the Achumawi and Atsugewi—to capture women 177
and children, Pit River bows, and other loot. As Chiloquin, one 721
of the leaders of the time, recalled:

> When the Snakes [Northern Paiute] made war on us that made us keen to fight other Indians and we made war without provocation on the Pitt Rivers, Shastas and Rogue Rivers, but they never made willing war on us. Those wars lasted a great many years. We found we could make money by war, for we sold the provisions and property captured for horses and other things we needed. It was like soldiers nowadays who fight for money. We made war because we made money by it and we rather got to like it anyhow. The Snakes provoked us to make war on them.[8]

With developing warfare and the accumulation of foreign K M
wealth came a gradual transformation of Klamath, and to a 175
lesser extent, of Modoc society. The forays into hostile country 178
enlarged the scale of the war party. Chiloquin speaks of a body 726
totaling one hundred warriors, which included, according to Spier,
members of all the Klamath tribelets, and took in some Modoc as
well.[9] A joint raid on the part of Umpqua, Upland Takelma, and
other western tribes brought one such retaliatory reprisal about

K

M
175 1850. Aggressions by Northern Paiute bands led to similar large-
178 scale forays into the country east of Silver and Summer lakes.
726 The almost endemic condition of warfare and the enlarging
K M scale of operations, together with the lucrative trade in booty,
175 brought about the emergence of a chiefly class, the members of
726 which based their power upon eminence in war and possession
182 of wealth, including slaves.[10] Their successes attracted followers,
622 and common interest as well as kinship prompted them at times
565 to cement alliances with shamans.

556 Thus they drew into their hands coercive powers of no mean
756 weight, for, as Henry Blow observed, "this [shamanistic] power
[754] was used by the chiefs to get rid of rivals and there are some of
us old enough to remember of doctors being paid to kill certain
persons and of their foretellings of the exact day they would
die."[11]

K The rise of the chiefs helped to knit together tribal loyalties.
M
175 A war party formerly consisted of only those among the able-
178 bodied men who were inclined to fighting, but a successful leader
622 increasingly transcended tribelet parochialism, drawing followers
619 from diverse hamlets and villages across the Klamath country.
628 As warfare became a way of life, the occasional allegiance ren-
726 dered while in the field became an enduring acknowledgment
of worth.

K In the growing eminence of the new leadership, hereditary
622 principles may have been operative. Chiloquin mentions his
father as having been a chief on Klamath Marsh, his own brother
175 as a subchief, and a sister as a chief. The father of Dave Hill,
a rising young war leader, was a village chief; while Allen David,
later head chief in reservation days, was the brother of Captain
George, a Klamath Lake chief. That family eminence was not
essential, however, is shown by the personal history of Lileks,
K of good—but not chiefly—background. Lileks was a transvestite
[838] in his youth until a supernatural experience vested him with the
power that was to lead him to be head chief of the Klamath.[12]

K A minor factor in these developments may have been the
195 interest of the whites in the centralization of tribal power, in
643 order that they might deal more effectively with responsible
648 leaders. In 1844, Elijah White, then Sub-agent for Indian affairs
177 met with some Klamath and Molala who had ridden into the

Kalapuya settlements in the vicinity of Oregon City, and induced 175 177
them to be regulated by the same rules as were the Nez Percés 643
and to appoint a single paramount chief. A disaffected Indian from 648
The Dalles, however, subsequently joined the party as it was making its way homeward and provoked a quarrel in which those favoring the Agent's proposal were slain.[13]

While these events were taking place, the Klamath country 175
was again being visited, at first by occasional parties whom the 648
Indians watched unseen. In the years 1844-45 a mixed party of Walla Walla, Spokane, and Cayuse, under the Walla Walla chief, Piupiumaksmaks, passed through the Klamath region en route to California to buy cattle. In 1843 and again in 1846 the Klamath were visited by the explorer, John C. Frémont. In his earlier visit, the martial captain, in order to quell "the treacherous disposition, which is a remarkable characteristic of the Indians south of the Columbia," fired a round from his howitzer over Klamath Marsh. Although his action was scarcely calculated to allay the suspicions of the Indians, he was shown the same courtesy as had been extended Peter Skene Ogden years before. A village chief—the father of David Hill—and his wife came out to meet the party and guided them east toward Summer Lake.

Frémont's second entrance, in 1846, was less fortunate. In that year, moving up from California, he passed through Modoc country and thereafter up the west shore of Upper Klamath Lake, where he was attacked by a party that had followed him from the southern end of the lake. Three of his Delaware Indians were slain. Although his attackers probably were from the Klamath Falls tribelet, Frémont's reprisal was directed instead at a village of the Lower Williamson group. Neither women nor children were spared in the attack. The slaughter left a legacy of hatred that did much to draw some of the Klamath into the Molala war.[14]

By the time of Frémont's second visit to the Kamath country, [1731]
the Indians of Oregon had been sorely stricken. Diseases brought by the whites had ravaged the tribes of the Columbia and Willamette valleys. The Hudson's Bay Company had sought to assure a firm supply of furs in the country it controlled and thus to maintain just and amicable relations with the Indians; and many of its employees had taken Indian wives. It was now being

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

175 supplanted by immigrants from the wagon trains and ships. 648 Some of the newcomers were from areas in which echoes of the frontier still lingered.

From the first, the settlers were active rivals of the Indians for lands and resources. They brought wives who were often repelled by the Indian way of life, and who established for themselves an insular world in which the Indian could find little place. Where they did not directly displace the natives, their swine uprooted camas and cous and their sheep browsed on berries. After an area had been inhabited by settlers for a time, it could no longer support the Indians, save as degraded and drunken remnants. The newcomers, as a whole, found little to respect in Indian culture; and many Indians who tried to follow the missionary's road found that it did not lead to the easy acquisition of the material wealth and status of the Americans. To the disillusioned apostates, finally, can be added those enraged by the lawless deeds of small bands of renegades, both Indian and white.

These events and others of local character lay behind the Cayuse slayings at the Whitman mission in 1847. In that same year, Crooked Finger, the leader of the closely related Northern Molala, visited the Umpqua, Rogue River, Pit River, Modoc, and Klamath, seeking recruits for an uprising timed to take advantage of the absence of local settlers in the military campaign against the Cayuse. Even as preparations were under way, emissaries from the Cayuse are said to have visited his camp in Molala country; but the settlers, forewarned, struck first. In the ensuing fighting, approximately eighty Klamath were involved, comprising over half of Crooked Finger's supporters, and a Klamath chief, Red Blanket, was slain. The triumphant whites gave the survivors three days to leave, and they departed along the Klamath Trail, bearing their dead with them.[15]

During these troubled times, the experience of the Klamath beyond their homeland was consistent: the white man was too powerful to be withstood. Comparable power, said some, must be sought in the white man's way. Link-River Jo, a Klamath sub-[597] chief, recalled in later years his contact in the 1840's with missionaries at The Dalles who

> told him about the Holy Spirit that was to come to the whole 175
> world and visit its remotest parts. When he came back from the 648
> Dalles he told his people about it but found them groping in [797]
> perfect darkness. . . . They would not believe him and told him
> he lied. He had watched long for the coming of the Holy Spirit
> and had never doubted that he should see him. He had heard
> Mr. Meacham talk for many days. . [and] now he saw that he
> was not like other men and knew that he must be the Holy
> Spirit come at last to bring gracious gifts for all tribes. . . .[16]

Others—and they were to become more influential—lived for 175
some time with whites and became convinced that the best 177
policy for the Klamath was one of peace. They included Lileks, 648
who in the course of the trading excursions to the north dwelled 622
for several years at The Dalles and was exposed there, no doubt, to the examples of authority set by whites as well as by the Columbia River tribes themselves. Another was Dave Hill, who, starting about 1859, lived approximately five years in Oregon City. Allen David, later to succeed Lileks as head chief in reservation days, was "well versed in the ways of the white man, from travel among the Willamette settlement." Another was Charley Preston who, like Hill, had spent five years at Oregon City, working for white farmers and had become "quite civilized and learned many of the white man's ways. He returned to his tribe and became a headman. . . ."[17]

Men such as these became the leaders of a "peace party"
among the Klamath, and their views achieved dominance in the 175
growing centralization of power among the Klamath. Lileks may 159
have consolidated the ascendancy he presently achieved as head 622
of this group by marriages beyond his tribelet: to the four wives [595]
from his own, Klamath Marsh, division, he added one each from
the Lower Williamson and Klamath Falls groups, as well as one
from the Modoc. From the Columbia he or a contemporary [177]
brought back new "laws," which included the institution of [681]
flogging as punishment for murder or for persistent quarreling. In one instance, ascribed by Spier, with some question, to prereservation days, when two men of the Lower Williamson River tribelet slew a Klamath Falls man, Lileks had them haled to Klamath Marsh, where each was beaten five times.[18]

When, in 1858, it was indicated that Klamath and Rogue 175
648

[Klamath Reservation]

K
175 River renegades had slain five prospectors on a tributary of the
648 Rogue River, the whites apprehended three Klamath involved
in the affair, "whom the Klamaths voluntarily killed to prevent
trouble; that tribe being now desirous of standing well with the
K U.S. Government."[19] It is probable that the hand of Lileks is to
[622] be discerned in this matter also. In brief, his power and that of
Chiloquin, often termed his second chief, was challenged only
by Captain George, leader of a faction hostile to the whites, and
by Monchnkasgitk, leader of the remote Upland tribelet.

K Thus the frontier condition brought a heightened rate of inter-
175 tribal warfare and of intertribal trading. It gave the Klamath
648 both peaceful and bellicose exposure to whites, largely outside
177 the Klamath homeland. In the awareness of new ways of life
[721] beyond the limited range of which their fathers had been con-
[439] scious the Klamath of the first half of the nineteenth century
became diversified in outlook. Enriched with new goods, Klamath
culture prospered, although in comparison with the levels
K achieved by the whites it seemed poorer than ever. Warfare had
M
721 consolidated power and wealth in the hands of leaders and the
648 magnitude of their operations drew Klamath and Modoc into an
175 uneasy cooperation.

622 Indeed, in many of these developments the Modoc participated
K only to a small degree. In disposing of those slaves destined to
M
175 be sold at The Dalles, the Klamath and occasionally the Warm
567 Springs peoples acted as middlemen; in consequence the Modoc
721 did not come as fully under the influence of the Columbia River
177 tribes, nor did they amass as much wealth. The development of
556 a chiefly class among them was feebler, and the tribelets co-
M
643 alesced under a single acknowledged leader only tardily and
525 incompletely.[20]

619 When in 1846 an exploring party under Jesse and Lindsay
M Applegate laid out an alternate emigrant route known as the
175 South Road, they directed it from Fort Hall down through Modoc
648 country and past the winter settlements on Tule and Lower
721 Klamath lakes, then west of the Cascades and north to the
Willamette settlements. The Modoc bitterly resented the invasion of their homeland and waged war against the wagon
trains, a war which in turn brought reprisals from the settlers.
In 1852, after the Modoc had extensively damaged several trains

M
175
648
721

and manhandled some of the survivors, the citizens of Yreka, a mining town in California southwest of the Modoc country, organized a party led by one Ben Wright. Under the guise of a council, they met some forty-six Modoc, to whom they offered a feast of poisoned beef. When the Modoc, forewarned by a Warm Springs Indian, declined to eat, Wright and his followers shot and killed all but five of them.[21]

K

721

By contrast, the Klamath peace party withheld their hand. As Chiloquin later recalled an event of that year, a party under Captain Jim Crosby pursued some of the Modoc in the direction of Silver Lake.

> The troops did not find the Modocs but at Oux-y [at the north end of Klamath Marsh] killed some Klamaths. They killed a few up on the marsh, some on Williamson River and a good many on both sides of Klamath Lake, but this did not precipitate a war with my people. Even if they felt like avenging the death of the people, they knew they could not contend against the whites long, for they had learned they were as numerous as the trees on the mountains.
>
> Below the Dalles on the Columbia River a Modoc murdered one of the McKays or one of old Tom McKay's friends.[22] The murderer made his escape to the Modoc country, but was pursued as far as Oux-y by McKay's friends. The chief Chim-tolk and my brother, Beaded Hat, who was a sub-chief, and three men pursued the murderer and brought him back to Oux-y and there killed him.[23]

K
175
648

For the emergent leaders of the Klamath, the maintenance of a consistent policy toward neighboring settlers posed problems of control. Similar difficulties beset the whites. From 1852 on, some men were accepted within tribal territory by the Indians as personally known and trustworthy. Wallace Baldwin, who ran cattle on land south of the present site of Klamath Falls, was one to whom Indians made gifts of roots, wokas, and game. Judge F. Adams in 1856 was grazing two thousand head of cattle in the vicinity of Keno; having made terms with the Indians, he was not molested. Wendolen Nus ranged stock in Klamath country in 1858-59, and, following a sojourn in the John Day region, returned in the 1860's to become the first permanent settler in the Klamath Basin. From 1857 on, the fur trader, Marty Frain, made an annual trip out of Yreka for the spring fishing at Lost River. Frain is quoted as saying that the Indians would be

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

175 peaceable save for the whites who from time to time slew some
648 of them without provocation.[24]

The Indians had provocation in plenty. With the opening of the goldfields in northern California, would-be miners passed from the Willamette Valley through the Klamath country. There were the border ruffians living on the fringe of society, to whom the judgment of the Rev. Samuel Parker might justly apply. "Their demoralizing influence . . . with the Indians," he exclaimed, "has been lamentable, and they have imposed upon them in all the ways that sinful propensities dictate. It is said they have sold them packs of cards at high prices, calling them the bible; and have told them if they should refuse to give white men wives, God would be angry with them and punish them eternally, etc."[25] Some of the depredations ascribed to Indians were their doing.

Even the more responsible settlers found it difficult to escape being tangled in indiscriminate reprisals. Early in 1854 four men were slain near Lower Klamath Lake, and in May of the same year settlers attacked the Indians at Klamath Ferry. In almost every case the government placed the responsibility upon the whites, a view the latter repudiated indignantly.[26]

Armed escorts provided for the immigrant trains discouraged direct and massive assaults, but did not entirely eliminate them. Meanwhile, bands comprising individuals from several tribes were harrying transient prospectors, settlers, and particularly immigrants plodding full-laden through tribal territory.

In 1862 Joseph A. Chaffee established a ferry across the Klamath River and another at the lower end of Klamath Lake, after having paid the sum of one hundred dollars which the bands required of him. The Indians then extorted a second fare from each of his passengers and after two weeks drove Chaffee away. He reported that they levied a charge of one dollar a night for grass upon those passing through the country and robbed small and defenseless parties. These bands, well armed, were said to comprise Modoc, Paiute, and Snakes (Northern Paiute), who asserted "that in case of difficulty, they will be supported by all these different tribes of Indians."[27]

The rapid settlement of the country made evident that some control must be extended over the tribes of southern Oregon. As

early as 1849, Jesse Applegate, who had glimpsed the Klamath Basin as a leader of the South Road expedition, introduced a bill into territorial legislature to charter an association, The Klamath Company, to treat with the Indians and purchase lands [illegible]om them.[28] Since these powers were reserved to the government, the bill failed of passage. In 1854, Joel Palmer, Superintendent of Indian Affairs for Oregon, desired to see at first hand the country and its people, whose "thieving propensities" had been a source of complaint. Consequently he persuaded a Klamath chief whom he encountered in Oregon City to bring together his people for a council at Klamath Lake.

Together with an interpreter, a Warm Springs guide, and the chief he made his way southward up the valley of the Deschutes and into Klamath country. It was mid-August and the tribesmen were doubtless out gathering wokas. Messengers sent to summon the Modoc, Paiute, and Pit River tribes proved to be fruitless; and only members of the Klamath Marsh, Agency Lake, and Lower Williamson River tribelets came in to the council. Palmer warned them of ". . . our determination to punish those who committed acts of violence and theft against our people, and [listened] to their replies and promises of good conduct. . . ." He then made some presents and the council broke up "with an apparent good feeling." Years later, Henry Blow was to contrast his liberality by inference with the parsimony of the government under the treaty.[29]

Palmer came away favorably impressed with the Klamath country as a place to colonize—i.e. remove—the Indians from the Willamette and Umpqua valleys. Of the three full Indian Agents under his control, he felt that the Agent for the southeastern district should reside in the vicinity of Klamath Lake, and that should the reservation he envisaged come into being a cavalry detachment should be posted there.[30]

The plan to remove the western tribes beyond the Cascades was subsequently dropped, but other phases of the plan were soon put into operation. Mounting hostilities, although not within Klamath territory, gave it impetus. Indeed, the surveying expedition under Lt. R. S. Williamson that pursued its way the next year through Klamath country and up the river that now bears his name, encountered no difficulty en route, but emerged from

175 648 its sojourn in eastern Oregon into the midst of the Rogue River and Yakima wars of 1855.[31]

Although behind them the Klamath settlements remained at peace, Klamath in the troubled areas were caught up in the dragnet. When the special agent for the upper Umpqua Valley was collecting the friendly Umpqua in order to shift them temporarily to the site of a proposed reservation, at the request of local citizens he also received some 35 Klamath, "who willingly surrendered their arms and ammunition." Again, in the roundup of approximately 1,440 Indians of coastal Oregon and the Willamette Valley in 1856, awaiting removal to permanent reservations, were members of tribes with whom no treaties had yet been concluded, who usually wintered in the Willamette Valley, and who in those troubled times sought the protection of the Indian department. Among them were 141 Klamath.[32] Even Lileks, out hunting deer in the mountains with some men of the Pelican Bay tribelet, was picked up, as were his companions. With their families they were taken to Oregon City and confined for some time until Lileks was able to secure their release.[33]

In the Klamath country itself, the alarms of war persistently pointed to the Klamath as hostile. Settlers reported the tribesmen armed and threatening on the Santiam and the Kalapuya, 202 and saw signal fires burning along the Klamath Trail from the Lakes to Oregon City.[34]

In the aftermath of warfare grew a new determination to end the recurrent hostilities. Wrote Commissioner of Indian Affairs James W. Denver in 1857:

> I know of no alternative to the present unsatisfactory and dangerous state of things but the adoption of early measures for the extinguishment of [Indian] title, and their colonization on properly located reservations, using and applying the consideration agreed to be allowed to them for their lands to subsist and clothe them until they can be taught and influenced to support and sustain themselves. The losses and damage to the government and to the citizens resulting from another general outbreak on the part of these Indians would probably fully equal, if not exceed, in amount what would be necessary to buy out and colonize them, so that they could be effectively controlled, if not improved and civilized.[35]

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

175
648

In Oregon, Indian Agent G. H. Abbott promptly paid a visit to the Klamath for the twin purpose of concluding treaties with Klamath and Modoc and of selecting a site for an agency. The legislative session of 1858-59 instructed the delegate to Congress to press for the establishment of both agency and a military post in the Klamath country. Once more in 1860 the legislature urged that treaties be signed with the remaining unreduced tribes of Oregon and that military posts be authorized at Warm Springs and in the Klamath region.[36] The outbreak of the Civil War delayed action until the following year.

Meanwhile, the hostile bands in southern Oregon grew bolder. They operated particularly in the zones beyond tribal territory, where the wagon trains, laden with potential loot and owned by nameless strangers who had no claim to consideration, were a fit counterpart to the villages of the Pit Rivers. For at least one leader an additional spur for the attack was provided by the fear that the country would soon fill up with strangers.

This man was the Klamath Lake chief, Kiluampch, "Old Brave," also known as Captain George. He was a brother of Allen David, who, however, held quite different views. It was during Captain George's period of dominance that Chief Sam of the Rogue River hostiles reported in 1852 that "the Indians at the Klamath Lake country had agreed to kill off all that might come in that way. That they do not intend to let any more whites come into their country." Two years later, as Judge A. M. Rosborough wrote Colonel Drew, the Klamath met with emissaries from the tribes of the Illinois, Rogue, and Upper Klamath rivers to plan concerted war upon the whites, with the bands of Shasta and Scott's Valleys attending but declining to take part. "The Upper Klamath or Klamath Lake Indians," he added, "(with the exception of the tribe [of] which La Lakes is chief) commenced their depredations by killing Whites and stealing stock, and a report was current among the friendly Indians that these hostiles intended to destroy the immigrants as fast as they came from the Valley of the Humboldt."[37]

Captain George, like his brother, had been exposed to the American settlements but had been antagonized in the process. "George," wrote Elijah Steele, "had acquired some knowledge

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

175
648
of the English language, and fully comprehended the civil war under which our unfortunate country is now suffering, and he thought, or professed to think, that if all the Indians unite they could kill off all the whites and retake the country." He and another chief, known as Skookum John—a man suspected of instigating trouble in 1856—were reputed to counsel war continuously.[38]

In power, the redoubtable hostile had few peers. As of about [624] 1859, he was war chief of both Klamath and Modoc, in which capacity he divested a Modoc chief of his elk-skin cuirasses for refusing to join an expedition against the Pit River tribes. Indeed, [622] Henry Blow later averred that Captain George had superseded Lileks as chief for a time, during which he had entered into a treaty—with whom is uncertain, though possibly with Rosborough or Steele in Northern California—and had been promised pay as head chief.[39]

In its own time, the government moved to contain the threat posed by his ascendancy. The necessary action embraced both military and civil commitments, and the contentions engendered lie vividly upon the pages of the day.

Outstanding among the individuals involved were members of the numerous Applegate clan, whose destinies were to be intertwined with the Klamath for almost a half-century. They were led by the doughty Lindsay Applegate, who had crossed the plains with his brothers, Jesse and Charles, and their families in the great migration of 1843. A staunch Union man and a Republican, he then resided at Ashland Mills, across the Cascades from the Klamath country. Of his extensive family, mention should be made of four of his sons, Elisha, who held the office of surveyor general, Ivan, Lucien, and Oliver. As a member of the state legislature, Lindsay Applegate had been instrumental in securing passage of the joint resolution calling for the establishment of a military post in the Klamath country. During the Rogue River War, he had served with distinction as captain of a company of mounted volunteers. His second-in-command on that occasion had been J. W. Perit Huntington, married to a daughter of brother Charles, and a man with whom he shared the conviction that the Indians must be dealt with firmly but justly.[40]

Acting out of Northern California from the mining town of Yreka, south of the Modoc country, were A. M. Rosborough and his friend and successor, Judge Elijah Steele. They followed a policy in independence of that in Oregon and exercised a restraint in dealing with the hostiles which Applegate and his associates were to denounce as coddling. Animosities between the two states were involved: the Californians with some justification maintained that the Oregonians were bent on making a profit from the location of the military post.[41]

As if it were not enough to find a schism within the ranks of those civilians who were to be responsible for the handling of Indian affairs, further complications arose. The military campaign was entrusted to a company of volunteers led by Colonel Charles S. Drew, who hailed from the town of Jacksonville, a few miles distant from Ashland Mills and its economic rival. Drew, as Steele averred, had come under the influence of Gen. George Wright, commanding the Department of the Pacific, and was aligned with him in violent disagreement with the leniency displayed toward the natives by the Indian Bureau. Applegate and his friends darkly suspected Drew of seditious views; and the implication is strong that they felt Drew was endeavoring, through harsh measures, to foment a general Indian war which would divert much needed troops from the fighting on the eastern seaboard.[42]

About 1861, the Rogue iver settlements were plagued by an influx of Klamath, Modoc, and Paiute, who were soon supporting themselves by trading with the whites, by theft, and by prostitution of their women. They expressed themselves as eager to sell their lands, but in their new location they were "a constant source of annoyance and terror" to the settlers. Consequently, anticipating an immediate danger, the Superintendent of Indian Affairs for Oregon, William H. Rector, appointed Lindsay Applegate to the post of special Indian agent for the Indians of southern Oregon to deal with these and related matters. Shortly thereafter, Elisha Applegate rode off to Salem carrying a petition from the people of Jackson County for a reservation at Klamath Lake.[43]

The new military post was authorized and in 1863 it took form in the heart of the Klamath country, between Fort Creek and Wood River. Bitterly, Lindsay Applegate, once more a private

K
175
648
citizen—his office having lapsed for lack of authorized pay—denounced the location in a letter to Huntington, now Superintendent of Indian Affairs for Oregon. "Drew . . . and his *Copperhead* friends, have already committed an outrage in the country, by locating the Fort in a place, where it entirely fails to accomplish the objects for which a post was ordered, solely I believe for selfish and factious purposes of their clan."[44]

Drew, while recommending that treaties be concluded with Lileks' and Old George's bands of Klamath, and with certain other groups, roundly scored these tribes as "a horde of practical thieves, highwaymen, and murderers, cowardly sycophants before the white man's face, and perfidious assassins behind his back". He annexed to his report a detailed list of hostilities in the Klamath Lake – Tule Lake – Goose Lake region from the opening of the South Road down to the time of his report. Following one such attack in 1856 which left at least thirty-nine fatalities, and in which the abduction of women and children was suspected, as he claimed, "the Indians of Umpqua valley exhibited an unusual number of dresses and other articles of female apparel,* which they alleged they had obtained from the Indians at Klamath Lake".[45]

K

Drew moved with dispatch. To the south, the long-standing warfare waged by Klamath and Modoc against Shasta and Pit River tribes had ended by embroiling them with the settlers. Suspecting the whites of having sided with the Shasta, who had slain several of their warriors, the hostile Klamath and Modoc under Captain George had, in the words of Steele, "commenced depredations by stealing the cattle of the frontier settlements, robbing travellers passing through their country, and uttering threats of murder and war on the opening of the spring." Acting upon a petition by citizens and a letter from Sub-agent Amos E. Rogers, Drew promptly arrested Captain George and summarily hanged him. George's troublesome colleague, Skookum John, met his death in the same action. At one stroke the bellicose faction had been decapitated.[46]

K
175
648
So draconian a measure did not pass without comment. In a confidential letter to Huntington, Rogers wrote from Jacksonville, intimating that it had all been planned beforehand by Drew and other Copperheads at a "turkey and champaign dinner" at

Captain T'Vault's. "The party who met at this dinner," he insisted, "freely discussed the policy of this arest* and execution. It was determined that the charges contained in the petition of citizens and my letter to Drew was sufficient to arrest and hang the Indian . . . without trial or further evidence. The insolence that Drew complained of was, of course, but a pretext."[47] 175 648

The Indians, not surprisingly, found these measures profoundly unsettling, and sought out their friend, Lindsay Applegate. 'I was visited a few days ago by Lake indians," he recounted to Huntington early in 1864,

> who said that they had been instructed by thier people, to learn of me, whether thier country was to be taken from them or not without compensation, and if they were to be made slaves. They say Col. Drew has taken possession without thier having any assurance that they would ever get anything for thier country, and that it would shortly be over run by settlers.
>
> They complain bitterly of these things, [but] say they do not want war with the whites. . . . If the Bill now before Congress proposing to make treaties with these indians, passes, we will be saved in all probability from an indian war, for the course that Drew is pursuing toward them will I think, if not counteracted in some way, certainly lead to war. . . ."[48]

In June, Huntington, having communicated with his opposite in California, Austin E. Wiley, made his way to the new post, Fort Klamath, to confer with the Klamath and Modoc chiefs and those headmen that could be assembled in preparation for a treaty council the following October. He reported that they were "friendly with the whites and have been for some time. Their desire to treat for the sale of their lands has been known for some time. . . ." He was pleased to learn that Capt. William Kelly, finding the Indians in a suffering condition during the previous winter, had advanced them foodstuffs out of his own stores. It was an act of statemanship pronounced by Huntington to have "a most salutory effect in conciliating the Indians, and rendering future control of them easy and economical."[49]

In California a few months earlier, another peacemaker had been at work. Elijah Steele, who had succeeded his friend, Rosborough, as Indian Agent, had returned in mid-February from San Francisco to find a large gathering of Indians encamped

---

* Original spelling has been adhered to in all reports and letters.

K 175 648 near his house, whom his wife "had been lecturing . . . upon the best way to live with each other, and with other people." They were the chastened tribes whose hostilities Drew had summarily suppressed, now gathered under their peace chiefs: K M 175 648 the Klamath were here under Lileks, the Modoc under Schonchin, and the Shasta bands under their several chiefs.

Steele saw an opportunity to stabilize the frontier, and set about to conclude a treaty. He justified his action by the belief that the country of the Klamath and Modoc extended into California, that "an unhappy difference existed between [Agent Amos E. Rogers at] Jacksonville and the military department [i.e. Drew]," and that there was impending danger of an outbreak of hostilities.

He and interested citizens now found it relatively easy to reach an agreement with the tribes whereby they consented to live in peace and friendship with one another, to give up to the soldiers for punishment any person who violated this principle; to live on the same terms with non-Indians, permitting them free passage through their country and charging them only for ferry passage across rivers or guiding them on their way. They further agreed not to get drunk or to steal when in the settlements or white camps, or to rob the Chinese sluice-miners; to remain out of town at night, to refrain from selling Indian children of their own or other tribes or from selling women to any save an Indian, unless the purchaser agreed to marry her before a judge.

The Klamath and Modoc convenanted not to raid the Pit River tribes and to submit to the regulation of the officers at Fort Klamath. In the settled country, except when hunting, Indians were not to carry bows and arrows or firearms, and they were not to bring the latter into the settlements, except to be repaired. In return, they were granted permission to visit the settlements when provided with a pass from the officers at Fort Klamath, and were assured of protection while there.[50]

M 175 648 643 In his capacity as counselor of the Indians, Steele also intervened in a disputed Modoc leadership. Their dominant chief, Schonchin, had served as spokesman for the Modoc, still a loose congeries of bands, and had led them since his succession in 1846. In his earlier days, he had fought valiantly against the whites.

> I thought [he recollected in later years] if we killed all the white men we saw, that no more would come. We killed all we could;

> but they came more and more like new grass in the spring. I M
> looked around and saw that many of our young men were dead 175
> and could not come back to fight. My heart was sick. My people 648
> were few. I threw down my gun. I said, "I will not fight again." 643
> I made friends with the white man."[51]

Despite the fact that Schonchin was favorably disposed toward M 175
the whites and had represented the Modoc in an agreement at 648
which Steele had presided, Steele heeded more militant factions 643
which sought to replace him. Two chief contenders came forward: 578
the extremist, John Schonchin, a younger brother of the
chief who was then absent, and the somewhat more moderate M
Kintpuash, whom Steele dubbed Captain Jack. At the election, [666]
the tribesmen in attendance chose the latter, and Steele designated
him chief of all the Modoc.

In the course of the council, under the mistaken belief that M
Modoc territory lay largely within California, Steele negotiated 175
a treaty with that tribe whereby they pledged their readiness to 648
relinquish all their territory in exchange for assurances that they would be permitted to retain the area about Tule Lake. Since Steele was not authorized to enter into agreements of this character, his treaty was not ratified by Congress, although the Modoc remained unaware of that fact. Shortly thereafter, he was removed from office by a political maneuver.[52]

Less than a month after the Yreka council, the newspapers K
carried the news that Congress had appropriated $20,000 to effect M
a treaty and purchase the lands of the Klamath, Modoc, and 175 •
Paiute. Late in June, Huntington was instructed to effect the 648
treaty, and in August he visited the tribes for a preliminary conference. About the same time, Lileks and a delegation of Klamath are said to have waited on their friend, Captain Kelly, to propose that such a treaty be entered into. Early in October, Huntington, together with Agent William Logan to represent the absent superintendent for California, repaired once more to Fort Klamath to enter into the treaty.

The parties to the treaty, according to Huntington, included K M
21 Klamath chiefs and headmen, led by Lileks and Chiloquin, 175
representing 710 Klamath then present. Of the signatories who 648
can be identified, at least 9 were Klamath Marsh men. The 622
Modoc were led by Schonchin, still recognized as head chief by M
Huntington, and included the Klamath-Modoc interbreed, Chief 643

[Klamath Reservation]

K M George (Sleketatk), Captain Jack, and one Chuck-e-i-ox
175 (Njakeaks).[53] They are said to have represented 339 Modoc.
648 Finally, there were two Paiute, who signed for some 22 members
622 then present of a group known as the Yahuskin band of Snakes.[54]
M The Walpapi Snakes, under their crafty leader, Panaina, were
[643] also to have been included, but they withdrew and were dealt
with in a separate treaty in August, 1865.[55]

Captain Kelly, who was present, gives figures for the tribes that differ somewhat from those of Huntington. He notes that all the Klamath, including their slaves, were present, and numbered 133 males over fifteen years of age, 286 women, and 214 children. Of the Modoc, 46 men, 15 women, and 16 children were in attendance. "About 40 of the Modoc warriors," he adds, "were absent with the women and children in their own country. They have about the same proportion of women and children as the Klamaths." Finally, the Snakes numbered 11 men, 5 women, and 6 children.[56] It is possible that the absent Modoc included members of the party advocating continued resistance.

Many years later, the Upland Klamath leader, Monchnkasgitk, recalled the treaty making:

> Huntington came to Council Grove and sent out invitations to all the Indians to meet him to discuss a treaty about the lands. I went as chief with Seven Warm Springs Indians to the first meeting at Council Grove. I met La Lake, head chief, and Chiloquen, chiefs of the Klamaths; also Captain Jack, Schonchen, and Chief George of the Modocs.
>
> Huntington met me there with the man who wrote for him, and another white man. We were there about a week and talked three days about the treaty. We built our first camp fire under a big pine tree which I think is still there. Huntington made a speech and said: "I have come from Washington, from the Great Father, to see about buying your land and have brought [with] me the things to pay for it." He then showed up fishhooks, beads, buttons, coarse blankets, and red paint. Huntington finished his speech by saying, "Tell me how much land you want to save for yourselves?" The chiefs went back to the camp and talked among themselves and agreed, and the next day told Huntington they wanted the land from the three snow mountains and the Cascades (the three sisters) from there to Steens Mountain; thence southerly along the mountains east of Goose Lake Valley to the California line, then westerly to the Cascades, taking in the Tule Lake country; then back to the beginning.

[Klamath Reservation]

Parenthetically, it may be observed that this tract encompasses in a general way the entire holdings of the three signatory groups, save that the Modoc included only the land reserved for them under the treaty with Steele earlier in the year. K M 175 648 •

> Huntington replied [Monchnkasgitk continues] that was "too much land for you to take care of and hold, and I want you to go back to your camp and think it over, and then point out to me land near your homes here, which you can hold and take care of." So we went to camp and all talked it over for many hours, and finally agreed on Lee Lakes proposition, that we should keep the land to Tom sum ne, then to His chok sal as, Bal la wisk se, Tsne whel ste e los, Ba ha, Chok chok e lisk se, then to Kal wal by Ish tish e wax.
>
> To this Huntington agreed, saying, "That is all right; and the matter is now finished. You will be closed up, like in a high fence, so no one can get over to you, or their cattle get over, nor can you get out to them without permission; so, tomorrow I will issue you all the things I have, and to-night we will have a big dance."
>
> The next day the things Huntington had were issued and they all went and signed the treaty.[57]

The Klamath, Nash observes, are reported to have signed the treaty willingly but both Modoc and Paiute did so only with reluctance.[58]

In the designation of boundaries, the seeds for future contention were sown. As members of the Boundary Commission observed in 1896:

> The two Commissioners of the Government, with their assistants, proceeded into a country practically unknown to them to treat with an assemblage of Indians who were ignorant of the fundamental principles of the matter to be discussed, the Indian language having no words expressing the idea of direction, by equivalents of the points of the compass, or distance by measures of miles, yards, etc.[*] To this day the older Indians can only designate direction by pointing, and distance by fractions of a day's travel; hence their topographical descriptions were very vague, unless confined to particular points. It is not surprising, therefore, that confusion should ensue when the agreement, reached after days of discussion, under such conditions, was condensed into a few lines of our language.[*]

The terms of the treaty mark the passage of the Indians—who came to be designated the Klamath Tribe—from a state of sovereign independence to a place under the government of the K 175 648

175 United States, and more directly under the supervision of an
648 Agent. Part of the Agent's duties were "to promote the well-being of the Indians, advance them in civilization, and especially agriculture, and . . . secure their moral improvement and education."[61]

The Tribe thus engaged to enter upon a program of extensive change designed to make its members into farmers by American standards, sending their children to school, and utilizing the services of a physician. It was even envisaged that they should at some time privately own the land they tilled, though without the power to alienate it. The terms of payment make it very probable that both parties to the treaty thought the Indians would be able to attain self-sufficiency by the end of twenty years. The reservation was to be set apart for the Indians, subject to the will of the President of the United States, with rights of way for railroads and public roads reserved for United States citizens, and with governmental option to move other tribes upon it in the future. The Indians agreed to submit to "all laws and regulations which the United States may prescribe for their government and conduct," including that banning their use of liquor, to remain upon the reservation, save when given temporary leave by the Agent, and to relinquish independent military action. They were confirmed in their exclusive right to take fish, roots, seeds, and berries within the reserved area, and were to be protected there against the trespass of any unauthorized white.[62]

The prominent role that governmental planning assigned to economic self-sufficiency and to isolation from outside interference is set forth in the words in which Huntington in his report justified the choice of site.

> In determining the bounds of the reservation, I sought primarily to secure a tract of country which had local advantages for supporting a colony of Indians by industrial pursuits. . . . A second object, and one scarcely less important, was to so locate the tribes that their separation from whites would be as nearly complete as possible. This reservation is not likely to be traversed by any important line of travel, and but a small portion of it will be coveted by whites for settlement.[63]

With slight amendments the treaty was signed once more in December, 1869, by the chiefs and headmen of the Indians, ratified by Congress, and signed into law and proclaimed February 17, 1870.

appointed sergeants of the force. "This," he added, "would give 657*
these chiefs something to do & a support. They would be interested 648*
terested in watching their people and in keeping good order."[81] 625
The move also would counter the opposition to the police among 622
the chiefs themselves, led by Allen David.

Once the force was authorized, Nickerson became aware of 657*
its peculiar jurisdictional limitations. When he sent the police 648*

No. 56 U. S. Indian Service,

Klamath Agency, Oct 2 1886

Permission is given Lieutenant Hook

to be absent from this Agency for a period of 3 Mo days, for purpose of visiting Linkville [illegible]

Object of visit to [illegible] on duty

On arrival he will report to the Agent

Reported:

, 188

Joseph Emery
U. S. Indian Agent.

This pass authorized an Indian police officer to leave the reservation for three months while on duty in the Linkville area. 1886.

to Linkville to round up Indians absent without passes and to pursue Indian horse thieves, he was informed that they had no power to make arrests off the reservation: the United States authorities must be notified to act. Yet when the turbulent Spokane Ike shot Skookum Doctor and fled, to be captured by the Indian police near Prineville, the U.S. District Attorney declined jurisdiction, saying that it lay either with the state courts or
with the tribe. Accordingly, "the chiefs in council, acting as a 657*
grand jury, accused Spokane Ike of the crime of murder. A court 648*
was held, the Indian Agent presiding. A jury, of twelve of the 622
most intelligent Indians of the tribe was selected. . . ." Both by 592
the testimony of a witness and by his own statement the defend- 695
ant was found guilty of murder in the first degree. Upon further 000

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 175
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common 101
experience and status as Indian in contrast to White, the contemporary Klamath 177
may be considered as one people. This section consists of a sketch of today's
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the 162
reservation's population.

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 13
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological [184]
aspects of these water courses were essential to the aboriginal Klamath economy, [224]
as they are essential to the recreational hunting and fishing of the present
population, White or Klamath. [226]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly
White culture. For nearly a century they have maintained multiple loyalties: 648
to the Agency, which represents the Government, to the Tribe, which was an artificial [829]
construct and has seldom been a viable corporate group, to the local
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet 178
in the same years the Klamath have also acquired and learned much, and it would
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-residence
with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White [181]
men of the Klamath. Instead, there has developed a variant socio-cultural
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been transferred 648
to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not
utilize these resources. These latter homesteads are little more than rural [241]
slums, the scenes of perennial drinking parties. For decades the timber industry [511]
has been the mainstay of the local economy, but relatively few Klamath have
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

Most Klamath live in one or another of the several
648 towns and settlements on the reservation, or else they have settled elsewhere,
361 in Portland, Salem, Eugene, in California, in Alaska, in the Midwest, or along
[167] the Atlantic seaboard. In 1955 the Tribe had 2118 members, and of these 40
percent lived away from the reservation (Stern & Swanson 1960). Partly because
[619] of the recent progress of the termination of federal supervision of the reservation,
by this date the percentage of members residing off the reservation has
[161] probably increased. In fact, for years there have been numerous "tribal members"
[619] with no experience whatsoever of reservation life.

648 Throughout the years of White contact inter-marriage and inter-breeding have
144 been frequent. Today, more than 70 percent of the Tribe's members are, genetically,
less than one-half "Indian," and less than one sixth are "full-bloods."
[171] Many are indistinguishable in appearance from their White neighbors, as most are
not easily distinguished in dress and language.

175 The isolation of the early reservation period was soon removed by the influx
177 of White settlers, who at first took up farms and started towns near the fringes
of the reservation. Through inter-marriage and through the consequences of
[361] allotment of land to individual Klamath, many Whites were soon residing within
the reservation's boundaries, either on the lands of a spouse, or on land bought
[423] or leased from tribal members. Another source of change were the ever present
efforts of Agency officials to make over aboriginal ways, and later, the rapid
[657] growth of the lumber industry and the development of full fledged frontier communities
were also important sources of acculturative influences. In quick
[726] succession the Klamath experienced a period of armed conflict (the Modoc War of
[786] 1872-73), a religious revivalistic movement such as that which swept the plains
area, extensive governmental planning and intervention, the allotment of land
[181] in severalty, and a growing participation in the cash economy. Because aboriginal
Klamath values had stressed achieved status for those who worked to accumulate
[556] wealth and property, for some Klamath the early period of contact provided increased
opportunities, and there was a group of men who for a time were effective
[436] entrepreneurs. It was through such personal efforts and through the "easy money"
had from private sales or the leasing of agricultural lands, from pro rata shares
of boundary settlements, and from per capita payments for sales of tribal timber
that the Klamath made the transition to a money economy.

648 The participation in and contribution of the Klamath to the economy of the region
is a significant point of interchange between Klamath and White, and one with
[313] many ramifications. In considerable measure, the local timber industry prospers
[423] or slumps, depending on the allotted cut in the tribal forest. Similarly,
local merchants are somewhat dependent upon the assured income of tribal members,
[434] as they are upon the purchases of mill workers, fallers, and cat-skinners.
The major town on the reservation, Chiloquin, obtains the largest share of its
[632] revenue from sales at a municipally owned beer-hall and from the fines and forfeited
[651] bails paid by visitors to the city jail, both of which establishments are
patronized largely by Klamath.

648 In other aspects of community life the participation of Klamath is perhaps best
621 characterized as that of passive spectators. Many Klamath have come to have a
sense of being aliens in the heterogeneous local culture, although there is a
563 small assimilated minority.

[571] Thus Klamath may interact as equals in card rooms and pool hall, and are met
with a stereotyped "friendliness" in interactions in stores and on the street.
However, the great majority live in intimate interdependence separate from the
main currents of White social life. White ethnic exclusiveness is reflected

802 171 The numeration system of a people is a relic of a remote age, and therefore of importance for tracing the ancient connections of tribes. The quinary system is the most frequent counting method in America, and often combines with the vigesimal. The pure quinary system prevails in Ara, in the Chimaríko, Yuki, and in the Shasti-Pit River family, in Sahaptin and Wayíletpu, and it is also the system found in Klamath. Curiously enough, the Maidu Indians count by fifteens, and the decimal system forms the basis [801] of the Wintún, Mutsun, and Selish dialects. The mystic or "sacred" number occurring hundreds of times in mythologic stories is *five* among all the Oregonian tribes.

197 To sum up the result of the above linguistic inquiry, it may be stated that our present knowledge does not allow us to connect the Klamath language genealogically with any of the other languages compared, but *that it stands as a linguistic family for itself.* It has adopted elements from the tongues spoken in its neighborhood; and a common element, chiefly pronominal, underlies several of these and the American languages in general.

THE HISTORIC PERIOD.

'Εκ δὲ τοῦ καὶ πιστὰ πάντα κἀπίελπτα γίγνεται.

174 175 127 On account of the superstition previously alluded to, the traditional historic lore which forms so attractive a feature in the unwritten literature of the nations east of the Rocky Mountains and of Mexico is wanting entirely among the Máklaks, and we have to rely upon the meager reports of travelers and Government agents for accounts of the condition of the tribes in the earlier part of this century. Such notices of historic events are as follows:

000 According to a tradition recorded by Stephen Powers, an epidemic of small-pox broke out among the Modoc Indians in 1847, by which one hundred and fifty individuals perished.

The earliest historic conflict which can be ascertained with some chronological accuracy is the massacre of eighteen immigrants to Oregon by individuals of the Modoc tribe, and Ben Wright's massacre, consequent upon that bloody deed. The massacre of the immigrants occurred at a place on Tule or Rhett Lake, since called Bloody Point. Undoubtedly this was only

000 one in a series of similar butcheries. Apparently it occurred in 1852, and
the particulars are all given in Texts, pages 13 and 14.

175 One of the earliest reports upon these tribes made to the Bureau of
101 Indian Affairs at Washington is that of Joel Palmer, Superintendent of
131 Indian Affairs for Oregon, dated Dayton, Oregon, September 11, 1854.
Palmer states that the lands of the Klamath Indians extend upon the eastern
base of the Cascade range for about thirty miles east, and that east of
them live the "Mo-docks," who speak the same language as the Klamaths;
and east of these again, extending farther south, are the "Mo-e-twas" (Pit
175 River Indians). These two last-named tribes have always evinced a deadly
648 hostility to the whites, and the Modocs boasted of having within the last
four years murdered thirty-six whites. Palmer entered into an agreement
with the Klamath Indians to keep the peace with the white people, and also
sent messengers to the Modocs and Pit Rivers, believing that henceforth
[161] the immigrants would be spared from their attacks. The Klamath Lakes
were then enfeebled by wars with the surrounding tribes and by conflicts
among themselves, and were said to number but four hundred and fifteen
souls. He counted seven villages on Upper Klamath Lake, two on Pliock
Creek (P'laíkni or Sprague River), three on Toqua Lake (Túkua), and one
175 on Coasto (Koháshti) Lake.* The Indians had some guns, horses, camp
411 equipage, and the aboriginal war-club and "elk-skin shield" (kaknō'lsh).
231 Little Klamath Lake he calls An-coose, a corruption of Agáwesh.

714 Neither Klamath Lake nor Modoc Indians have taken any part in the
great Oregon war of 1854–'56, although their sympathies were of course
strongly in favor of the aboriginal cause.

000 For the year 1854 Powers records a battle fought by Captain Judy
against Modoc and Shasti Indians on the Klamath River, north of Yreka,
in which some women of the Shasti were killed.

The Report of 1859 speaks of continued hostilities on the side of the Modocs against passing immigrants and of the murdering of a party of five white men in Jackson County, Oregon. Two of the murderers belonged to the tribe of Chief Lelékash, and three of the perpetrators were seized and killed by the Klamath Indians (page 392).

---

* This would make only six, not seven, villages.

• 175 622 Alexander S. Taylor has the following passage in his "California Farmer" of June 22, 1860: "Cumtukus, Lalacks, Schonches, and Tertupkark are names of chiefs among Klamath Lake Indians of the Oukskenah tribe. The big Klamath Lake is called Toakwa." Except the first, the above head-men were all identified in the Dictionary with the well-known names of Lelékash, Skóntchish (a Modoc chief) and Tatápkaksh. Cumtukni, who died about 1866, is mentioned by Stephen Powers as a great orator, prophet, and rain-maker.[†]

175 648 726 Whether the two incursions made upon the Klamath Lake people by the Rogue River Indians of Tinné lineage, across the Cascade range, of which detailed accounts were furnished in our Texts by Dave Hill, took place about 1855 or earlier I have not the means of ascertaining. The Lake tribe were not slow in inflicting vengeance upon the attacking party, for they crossed the mountain pass and fell upon the camps of their enemies, making sad havoc among them.

Frequent disputes and encounters occurred between the two chieftaincies and the *Shasti Indians* around Yreka, California; but the warlike qualities of the latter were often too strong for the aggressors, and the conflicts were not very bloody.[†] With the Pit River or Móatwash tribe the matter was different. They were not, like the Shasti, possessed of the warrior spirit, and therefore had to suffer terribly from the annual raids perpetrated upon them. In April and May the Klamath Lakes and Modocs would surround the camps, kill the men, and abduct the women and children to their homes, or sell them into slavery at the international bartering place at The Dalles. Some of these raids were provoked by horse-stealing, others by greed for gain and plunder, and the aggressors never suffered heavily thereby. When they began is not known, but the treaty of 1864 000 put an end to them. The recitals in the Texts, pages 19–27 and 54, 55,

---

[*] Overland Monthly, 1873, June number, page 540. His appearance had something fascinating for the Indians, and some are said to have traveled two hundred miles to consult him. His name appears to be Kúmĕtakni = "coming from a cave," or "living in a cave."

[†] One of these fights took place between the Shasti, Modoc, and Trinity River Indians for the possession of an obsidian quarry north of Shasta Butte, mentioned by B. B. Redding in American Naturalist, XIII, p. 668, et seq., and Archiv f. Anthropologie, XIV, p. 425.

000 give us graphic sketches of these intertribal broils. Some of the eastern Pit Rivers seem to have lived on friendly terms with the Modocs; but the bands farther south, especially the Hot Spring and Big Valley Indians, were the principal sufferers by these incursions. In a raid of 1857 fifty-six of their women and children were enslaved and sold on the Columbia River for Cayuse ponies, one squaw being rated at five or six horses and a boy one horse.*

The Pit River Indians were a predatory tribe also, and very dangerous to the immigrants passing through their country to northwestern Oregon. Their continued depredations made it a duty of the Government to inflict upon them a heavy chastisement, and Maj. Gen. George Crook, commanding the Colorado Department of the United States Army, was intrusted with its execution. This campaign of 1867 is described by him as follows:†

> I continued the campaign into the Pit River country with Company H, First Cavalry, Lieutenant Parnelle; Company D, Twenty-third Infantry, Lieutenant Madigan, First Cavalry, commanding; and Archie McIntosh, with his twenty Fort Boisé Indian scouts. We found on Pit River a party of warriors in camp. They fled. The next day we discovered a large party of warriors in the bluffs on the river. We had a severe fight, lasting two days and nights. They effected their escape by means of holes and crevices in the ground. A great many were killed, among whom were some of note; how many could not be ascertained. Our loss was Lieutenant Madigan and three men killed, and eight soldiers and one citizen wounded.

The more unruly portion of these Indians were subsequently removed to the Round Valley Reservation, California, and about two hundred are still in their old homes.

175 648 Between the Klamaths and the neighboring Snake tribes there was always a sort of disaffection, based upon difference of race, language, and habits; but whether their earlier relations were always those of open hostility or not is past finding out.‡ The wording of the treaty makes it probable that the hunting grounds north and east of their present seats on Sprague River were shared in common by both, and that the Snake Indians frequently

† Report of the Secretary of War, 1868-'69, Part I, p. 69, dated August 22, 1867. Stephen Powers refers to this fight in Contributions III, p. 268.

‡ One of the Texts, p. 28, shows that the Snakes in one instance attacked and massacred in a very cowardly way some women near the outlet of Williamson River.

175 changed their settlements, as hunting nations are in the habit of doing. 648 Thus Pauline Marsh, near Silver Lake, and Pauline Lake, on one of the head springs of Des Chutes River, were both named after the Snake chief Panaína of our Texts. The bands established upon the Reservation since the treaty was concluded are called Walpapi and Yahushkin. At first they ran off and committed depredations in the vicinity, whereupon the Government was compelled to force them back. General Crook made several expeditions in the execution of the task. These campaigns were short and decisive, and the Klamath Lake scouts engaged in them did good service, as evidenced by General Crook's reports * and Dave Hill's Text, pages 28–33. Upon the defeat and killing of Panaína, the Walpapi chief, the tribe finally quieted down and remained neutral in the commotion caused by the Modoc war of 1872–'73.

175 No indications are at hand of the number of Indians formerly inhabit- 161 ing the headwaters of the Klamath River. Before the first census was 164 taken estimates deserving no credence were made, varying from one thousand to two thousand Indians. In those times the scourges of small-pox, syphilis, and whisky did *not inflict such terrible ravages as they do now* among the Indians; but instead of these the continual tribal quarrels, family vengeance, the ordeals of witchcraft, dearth of food, and the inhuman treatment of the females must have claimed many more victims than at [523] present. Emigration and intermarriages with other tribes were rather the [167] exception than the rule, and are so even now.

THE TREATY OF 1864.

175 During the ten years following Wright's massacre the country began 648 to assume a somewhat different aspect through the agricultural and stock-raising settlements of white people that sprung up in Lost River Valley, around Little Klamath Lake and in other places. The cession of lands to the "Oregon Central Military Road Company" from Eugene City, in Willámet Valley, through the Cascade range, across the Klamath Marsh, to

---

[13] * Contained in the Report of the Secretary of War, 1868–'69, Part I, pp 69, 70, dated September 2, 1867, and March 19, 1868. The troops killed twenty-four Snake Indians in the expedition of 1867. See also Texts, Note to 28, 14.

175 Warner Lake, and thence to the boundary of Idaho, with its "six miles
648 limit" grants on both sides, took place before the conclusion of the treaty.

In order to subject the troublesome Snake and Modoc tribes to a stricter control, and to secure more protection to settlers and the immigrants traveling through Oregon, Fort Klamath was established north of Upper Klamath Lake, in Lake County, and garrisoned with several companies, who were of great service in preserving order in these sparsely inhabited tracts. The Klamath Lake Indians were more inclined to keep up friendship with the white people than the other tribes, nevertheless some turbulent characters among them necessitated military restraint.

The Superintendent of Indian Affairs of the Northern District of California, Judge E. Steele, adjusted some grave difficulties between the Shasti and the Máklaks Indians, which threatened to break out into a terrible war of devastation against the Shasti and the white settlers alike. Some of the Máklaks "braves" had been killed upon the lands of white settlers, and the injured Indians had begun retaliation already. Colonel Drew, stationed at Fort Klamath (who fought marauding bands of Shoshoni and Bannocks during the summer of 1864), had arrested and executed "Captain" George, a Klamath Lake chief, for criminal acts, and killed an Indian commonly known as Skukum John. The chiefs and some representative Indians of the contending tribes met Judge Steele near Yreka, California, on February 14, 1864, and for some trifling consideration agreed to forego all further hostilities among themselves, to allow free passage to anybody traveling through their territories, and to maintain terms of friendship with all whites, negroes, and Chinese. The Modocs also made the special promise to harass no longer the Pit River Indians by annual raids. It also appears from Mr. Steele's allocution to the Indians that they had been selling to whites and others Indian children of their own and of other tribes, and also squaws, the latter mainly for the purpose of prostitution.*

The establishment of Fort Klamath, the increase of white men's settlements, the possibility of Indian outbreaks on account of the greater vicinity of the farms to the Indian villages, and the desire of the Indians themselves to obtain rations, supplies, and annuities brought the opportunity of a

---

* Report of the Commissioner of Indian Affairs for 1864, pp. 84, 85 and 108–110.

175 148 treaty with these Indians more forcibly before the Government than ever before. In compliance with instructions from Indian Commissioner William P. Dole, Superintendent J. W. Perit Huntington, accompanied by Agent Logan, went through the Des Chutes Valley to Fort Klamath, and found there a large number of Indians of both sexes assembled, seven hundred and ten of whom were Klamath Lake, three hundred and thirty-nine Modoc people, and twenty-two of the Yahuskin band of Snake Indians. They unanimously concurred in the desire that Lindsey Applegate, a settler of Jackson County, Oregon, be appointed as their agent. The treaty was concluded on the 14th of October, 1864, and duly signed by the contracting parties, including twenty-six chiefs and principal men of the tribes. Huntington's estimate of funds necessary for fulfilling treaty stipulations and subsisting the Indians the first year amounted to a total of $69,400. The text of the treaty being too long for insertion entire, I restrict myself here to the contents of the principal paragraphs:

175 148 657 Article 1 stipulates the cession of the territory described above (p. xvi), and sets apart as a *reservation* for the tribes referred to the tract included within the limits following: Beginning upon the Point of Rocks, about twelve miles south of the mouth of Williamson River,* the boundary follows the eastern shore north to the mouth of Wood River; thence up Wood River to a point one mile north of the bridge at Fort Klamath; thence due east to the summit of the ridge which divides the upper and middle Klamath Lakes (now called Klamath Marsh and Upper Klamath Lake); thence along said ridge to a point due *east* of the north end of the upper lake; thence due east, passing the said north end of the upper lake to the summit of the mountains on the east side of the lake; thence along said mountain to the point where Sprague's River is intersected by the Ish-tish-ea-wax Creek (probably Meryl Creek); then in a southerly direction to the summit of the mountain, the extremity of which forms the Point of Rocks; thence along said mountain to the place of beginning. The tribes will remove to this reservation immediately after the ratification of the treaty and remain thereon. No whites, except employés and officers of the United States Government, are allowed to reside upon this tract, and the Indians have

---

*At the foot of Nílakshi Mountain.

175 the exclusive right of taking fish and gathering edible roots, seeds, and
648 berries within the reservation. Provision is made by which the right of
657 way for public roads and railroads across said reservation is reserved to
citizens of the United States.

Article 2. As a payment for the ceded lands the Indians shall receive $8,000 per annum for a period of five years, $5,000 per annum for the next five years, and the sum of $3,000 per annum for the five years next succeeding.

Article 3 provides for the payment of $35,000 for removing the Indians to the reservation, subsisting them during the first year, and providing them with clothing, teams, tools, seeds, etc.

313 Articles 4 and 5 provide for the establishment of a saw-mill, a flouring-
256 mill, a manual-labor school, and hospital buildings, all to be maintained
874 and supplied with working material at the expense of the United States for
783 the period of twenty years. Employés for running these establishments
shall be paid and housed by the Government also.

423 Article 6 reserves the right to the Government to provide each Indian
family with lands in severalty to the extent of forty to one hundred and twenty acres, and to guarantee possession to them. Indians are not allowed to alienate these lands.

Article 9. The Indians acknowledge their dependence upon the Government of the United States, and pledge themselves to be friendly with all citizens thereof, to commit no depredations upon the persons or property of said citizens, and to refrain from carrying on any war upon other Indian tribes.

273 Article 10 prohibits the sale and use of liquors upon the Reservation,
and Article 11 permits the Government to locate other Indian tribes thereon, the parties to this treaty not losing any rights thereby.

The treaty was proclaimed February 17, 1870.

Like most of the treaties concluded between the United States Government and the Indian tribes, this compact was made much more to the advantage of the white man than of his red brother. Not only were the stipulated annuities rather small for a body of Indians, which was then considered to number about two thousand people, but these annuities were

175 to be paid only after the ratification of the treaty by the President and the 648 Senate, which did not take place till five years after the conclusion, viz, 657 February 17, 1870. Meanwhile the Indians were always subject to the possibility of being removed from the homes of their ancestors by the stroke of a pen. The bungling composition of the document appears from the fact that a grave mistake was committed by inserting the term "east" instead of *west* (italicized in our text above), and by not mentioning the land grant made to the Oregon Central Military Wagon Road Company before 1864, which, when insisted upon, would, with its twelve-mile limits, take away the best parts of the Reserve, the Sprague River Valley, for instance. At the time when I visited the country, in the autumn of 1877, the Klamath Lake Indians showed much animosity against the settlers establishing themselves within their domain. The company having left many portions of their projected wagon road unfinished, Congress, by act approved March 2, 1889, directed the Attorney-General to cause suits to be brought within six months from that date, in the name of the United States, in the United States Circuit Court for Oregon, to try the questions, among others, of the seasonable and proper completion of said road, and to obtain judgments, which the court was authorized to render, declaring forfeited to the United States all lands lying conterminous with those parts of the road which were not constructed in accordance with the requirements of the granting act. (Cf. on this subject Ex. Doc. 131, House of Representatives, Forty-ninth Congress, first session, and Ex. Doc. 124, Senate, Fiftieth Congress.)

The first representative of the Government, Subagent Lindsey Applegate, erected some buildings at the northwest point of Upper Klamath Lake, called Skohuáshki (abbr. Kohá́shti); but as early as 1866 he called attention to the fact that the place had no suitable water-power, but that three miles above the little creek at Beetle's Rest was a most excellent motor for driving a saw-mill and a grist-mill, and, being on the edge of the pine woods, was a well-fitted and shady place for the agency buildings. This advice was followed in 1868, two years before the ratification of the 177 treaty. In the same year the old practice of cremating dead bodies was 764 abandoned and inhumation introduced. The grave-yard was established around the ash-pile of cremation, still visible in 1877, and in 1878 a second

177 cemetery was inaugurated between the Williamson River and Modoc Point,
764 one mile and a half south of the bridge.

175 President U. S. Grant's peace policy in regard to the Indians was
648 inaugurated by act of Congress dated April 10, 1869. The supervision of
657 the Indian agencies was placed in the hands of the authorities of religious
797 denominations, a board of commissioners appointed,* and the spiritual interests of that reservation turned over to the Methodist Church.

SCIENTIFIC RESEARCHES ON THESE INDIANS.

114 The study of the ethnography of a tribe usually precedes that of its language; sometimes both are pursued simultaneously, and this is undoubtedly the correct method. In the case of the Máklaks, Horatio Hale,† the linguist of Ch. Wilkes's United States Exploring Expedition (1838–1842), and still holding forth as a pioneer in his lines of research, took down a vocabulary from a Klamath Lake Indian whom he met on the Columbia River in 1841. No ethnographic remarks upon the tribe accompany this vocabulary, probably because information obtained from interpreters, who speak the Chinook jargon only, is notoriously unreliable.

Next in time follow the extensive explorations of John Charles Frémont‡ of the interior basin west of the Rocky Mountains and of the Pacific coast from 1843 to 1844, and again from 1845 to 1846, during which the Klamath Lakes and Klamath Marsh were visited and explored. His reports contain graphic sketches of all that was seen and observed by his parties; but scientific accuracy is often wanting, and many countries are described without giving the Indian local names, which are indispensable to identification.

The acquisition of the Pacific coast by the United States (California in 1846, Oregon in 1848) naturally suggested projects of connecting the two oceans by a transcontinental railroad, starting from the Mississippi River and reaching to the Bay of San Francisco. The Central Govern-

114 that these explorations were the starting-point of all further researches upon the Pacific coast, and as such they are creditable to the men with whom and the epoch at which they originated.

The topographic map of the Klamath headwaters is now being prepared by the U. S. Geological Survey. It is laid out upon a scale of 1 to 250,000, with contour intervals of 200 feet, the rivers and water sheets in blue. The sheets are named as follows: Ashland, Klamath,* Shasta, Modoc Lava Bed, Alturas—the last three belonging to California. The surveys were made from 1883 to 1887 by Henry Gannett, chief geographer, A. H. Thompson, geographer in charge; triangulation by the George M. Wheeler survey, by Mark B. Kerr; and topography, by Eugene Ricksecker and partly by Mark B. Kerr.

THE MODOC WAR OF 1872–1873.

175 648 657 The well-known maxim, "it is cheaper to feed the Indians than to fight them," has forced itself upon the governments of all American countries in such indelible characters that it has become a rule for them to conclude treaties with the different "nations" to keep them at peace, feed them by rations or annuities, and confine them within the limits of certain territories. The treaty of 1864 was not attended [illegible] all the favorable results expected. The Snake Indians ran off from the Reservation during April, 1866, the Modocs in 1865. The latter tribe were not compelled to leave their old domain, now ceded to the United States, till 1869. Moreover, it always takes several years to gather straying Indians upon a reservation after a treaty has become an accomplished fact. 000 The Superintendent of Indian Affairs in Oregon, Mr. Meacham, on December 30, 1869, after a long and excited "talk," succeeded in bringing two hundred and fifty-eight Modocs to Modoc Point, upon the reservation allotted to them. On April 26, 1870, the supply of rations was exhausted, and the more obstinate half of the tribe left the Reservation again for the old domain upon Lost River and the lakes, whereas the other half, under Skóntchish, went to Yáneks, on Sprague River, where the Superintendent located them. All Modocs

NOTES.

[124] 16. Dave Hill took part himself in one of these skirmishes. His historical accounts are all given in the conversational style, which almost throughout substitutes the [175] simple *s* for *sh*. I have not been able to determine the exact dates of these Rogue River raids; but they must have occurred before the end of 1855, when the Oregon war broke out, for after its termination most of the Rogue River Indians were removed from their old homes to the coast reservations of Northwestern Oregon. The raids occurred in the early youth of Dave Hill, who was born about 1840; so they may be placed between the years 1848 and 1855.

173
*539
726
19

16, 2. tínatoks forms antithesis to tína of the preceding clause. The literal meaning of both is: "one time . . . . . the other time."

16, 3. Wálamsi. The suffix -i, -í, is the adverbial particle hí, and forms a *locative case*, mainly found in local and topographical terms, as in Yámsi, Kakágosi, Ktaíwashi; also in a few generic nouns designating localities, encampments, mountains, etc.

16, 5. shûshû'dshapĕlish. The suffixed -sh is the pronoun sha, *they*, and in this suffixed form also appears as -tch, -s. This verb stands in the distributive form; shúdshapĕli, to rebuild a fire, being the absolute form.

16, 7. nánχatch, for nánχa tchish, "others also".

16, 10. yákanuapkuk, verbal causative of the future of yákna. The forms yä'kna, yä'ka, yékna, yéka, are preferable to yákna, yáka.

[727] 16, 11. sá-atsa. It is a common custom among western, and some eastern, wild tribes to force their captives to dance in honor of the victory gained over their own tribe. This is done especially during the scalp-dances.

16, 14. Titná lû'ks, etc. Here begins the account of a raid made by the Rogue River Indians upon the Klamath Lake settlements. It may have occurred one year after the raid previously narrated.

16, 15. sapíya, etc. After escaping, he informed his own countrymen of all the local conditions of the Klamath Lake people and their country, and used all his topographical knowledge in guiding their warriors to the attack.

17, 1 and 2. Tsûi nĕ'lka. Indians and uncivilized races in all portions of the world begin their raids upon the enemy before dawn, or at the earliest appearance of daylight.

17, 9. gäkán and gekuánapka, inflectional metathesis for gäkná and gekánuapka.

17, 14. huşhtchŏ'ktat for hushtchŏ'kat ät, ät (*ye*) being repeated twice.

17, 16. tsóķapks tcha is a contraction from tsoķápkash tchí'sh a.

17, 17. Tchíssa, for tchí sha: thus they.

17, 20. sellólok: synizesis of the longer form shéllualuk, shellualúgs: through fighting.

17, 21. yuyálks=sitk, abbreviated from yuyálkish=shítko, looking like persons mourning over their lost companions, or made sorrowful by bondage to Indians of a foreign tribe.

173 **28, 2.** gépkapsh, formed by syllabic elision from gepkápkash; cf. **29**, 19.

*539 **28, 2.** sákatla, to come up, to arrive by the trail.

726 **28**, 3 and 4. wéwaliks pi'la, the old women only; the younger ones, on whom prin-
648 cipally devolves the work of wókash-gathering, found time to escape in their canoes
[193] from the raiders.

[192] **28, 4.** k̲lewidshápka. The men had gone fishing to distant places, leaving their
[222] females in the camp, not apprehensive of any hostile attack.

[192] **28**, 8. kilō's, or k̲ilū's, is the epithet given to "Dry-Leg", the Snake chief; it means a bold fighter, leader of a fighting band; literally: "irate, wrathful", and may be here taken as an equivalent to "war-chief" (sessalólish lak̲i).

[193] **28**, 13. Moadoki'sh, apocopated for Moadokíshash; also **28**, 1: wéwanuish (wé-
[192] wan'sh) for wewannishash (shlüá gépkapsh). Nā'lsh tchí'sh, *us* also; that is, we of the
[657] Klamath Lake tribe, were gathered by Mr. Perit Huntington into one district, the newly established Klamath Reservation. A large number of the Lake People were then scattered about Klamath Marsh, which is visited by them now in summer only for fishing, gathering wókash and berries, and for hunting.

[657] **28, 14.** Dave Hill, now interpreter (lúldatkish) at the Klamath Lake Agency, took
[175] a part in this short but interesting expedition, in the capacity of an Indian scout. He fixes himself the date of it by the words "tína illolólatko", or a *full* year after the Indians had been gathered on the Reservation by Mr. Perit Huntington. The treaty was concluded on October 14, 1864, and the campaign was undertaken in 1866 by a small body of American troops for the purpose of bringing back to the Reservation a band of Snake Indians who had run away from it. This unruly tribe, jealous of its former independence, has left the Reservation even since then, and could only after much exertion be induced to return. The fights took place west of Warner Lake, and north of the border-line between California and Nevada, within the former haunts of these western Shoshonis.

[175] The Report of the Acting Commissioner of Indian Affairs for 1867, page 99 sq., mentions this expedition in the following laconic terms: "October 27, 1866, troops consisting of 21 men, First Oregon infantry, and five Indian Klamath scouts, under Lieutenant Oatman, and 27 men, First Oregon cavalry, under Lieutenant Small, had a fight with a band of hostile Snake Indians near Lake Abbott [should read: Abert], in the Klamath country, Southern Oregon. The Indians had so chosen their position that the troops were obliged to dismount to attack them. The fight lasted one and a half hour, and 14 Indians were killed and many wounded."

On page 100 of the same Report, another fight against Snake Indians is spoken of: "Late in November, 1866, in a conflict between the troops and Snake Indians near Fort Klamath, 10 Snake Indians were killed by the troops, and three more by the friendly Klamath and Moadocs who accompanied them." This may have been the same fight as the one above, reported with much less accuracy of detail.

[103] **29, 3.** Spá·ish Valley, name corrupted from Surprise Valley. This valley is situated in the northeastern angle of California, and on the shore of its two alkali lakes several American settlements have sprung up. A few Snake Indians live peaceably around Fort Bidwell, which is located at the northern extremity of the valley.

29, 10. tálaat tχalamti'tal, consonantic assimilation for tálaak tχalamti'tal, due west.

[192] **29**, 17 and 19. nā'ts, natch, for nā'ls, nā'lsh, nā'lash, *us*; náts a gépksi, for nā'lash a gépkash í.

NATIVE MYTH AND MODERN RELIGION AMONG THE KLAMATH INDIANS

By Robert F. Spencer

773 IN A RECENT STUDY[1] of social change among the Klamath Indians
177 of southern Oregon, informants revealed an unformalized synthesis of
178 aboriginal and modern Christian religious beliefs. These involve, among
[779] other ideas, an identification of the Klamath culture hero with personages in
the Christian pantheon such as the God-Father, Jesus, and Satan. This is of
interest since the contemporary Klamath have lost all formalized aspects of
their older culture. The major institutions of the past have fallen by the way
and, in their overt forms at least, have been replaced by those of the encroaching
Anglo-American society. Acculturation is so far along that the observer
[182] can elicit only covert survivals of aboriginal ideas. Although the tone of the
folk culture has been lost by the Klamath, the reservation life, a common
economy, and the wardship status enforced by external governmental agencies
combine to effect a haphazard solidarity in the group. It is hence not surprising
to discover a rephrasing of older values to meet modern situations.
A case in point is the attempt by many tribal members, young and old, to
find continuity in folklore and so to read Christian meaning into aboriginal
myth.

175 Klamath culture of the past was not essentially different in its orientation
177 from that of many western tribes. Because the tribe was geographically marginal
to several culture areas, it is possible to note the composite nature of its
culture and to discern the realignment and reintegration of elements which
[222] it shared with California, the Plateau-Basin, and the Northwest Coast. In
[226] its overall configuration, the native culture differed from that of the adjacent
gathering peoples because the Klamath had settled on the lakes and marshes
[631] of the region and depended on fish and a wild water-lily. Beyond the basic
[621] economic structure, however, one may note the California flavor of the separatistic
[771] hamlets with their loose social and political organization; the weakly
[791] developed (and possibly late) wealth complex, suggestive of the Northwest
and the Oregon coast; and the formalized shamanistic religion which points
to affinities with tribes in the Plateau, California, and elsewhere.[2]

---

[101] [1] This paper is based on data collected during two summer field sessions, 1948 and 1949,
[122] on the Klamath Reservation. Field research was subsidized by grants no. 21 (Reserve Fund, 1947) and no. 1132 (1949) from the American Philosophical Society, Philadelphia, and by research funds from the Department of Anthropology, University of Minnesota, Minneapolis.

[113] [2] Cf. Leslie Spier, *Klamath Ethnography* (University of California Publications in American Archaeology and Ethnology, 30, Berkeley, 1930), 224-325; Verne F. Ray, *Cultural Relations in the Plateau of Northwestern America* (F. W. Hodge Anniversary Volume, III, Los Angeles,

775 Crow's laughter turned the human and animal objects of his wrath into stones,[6]
776 the basalt outcropping which are today pointed out around the Klamath
[823] Reservation as evidence for the truth of the old tale. To summarize, while
the culture hero was not himself a source of power for men, the forces at his
command were essentially the same as those which every Klamath sought in
a formalized quest. Although concerned with natural phenomena like winds,
heat, and rain, Kemu'kemps was on the whole indifferent to the fate of men.
Like other anthropomorphic or zoömorphic culture heroes, he became the
theme of many tales, a source of amusement and entertainment in the aboriginal
Klamath culture. But even though humor was present in the tales concerning
him, he appears to have been regarded as real and with a slight tinge
of awe. There is no question of his marked importance in the aboriginal
culture.

To evaluate properly the Klamath culture hero in the modified setting
177 of the contemporary society, attention must be paid to the religious modifi-
175 cations in the group since the inception of culture change through the encroach-
[121] ment of Anglo-American settlers. The Klamath were never drawn into
hostilities with the Whites, unlike their linguistic relatives, the Modoc.
Contacted sporadically by Europeans from 1825 on, the Klamath were
ultimately drawn into a treaty with the United States in 1864. This reflected
pioneer movements to the west and the growth of White population in Oregon.
[791] An enforced culture change began with the treaty.[7] There was as a result
[797] proscription of the shaman's ecstatic curing activities and an intensity of
Christian missionization. Other introductions included a new technology,
White education in reservation boarding schools, a new status in relation to
an established administrative agency, and new concepts of property, society,
and political tribe.[8] The result was in some instances chaotic rebellion, a
resistance which took the form not so much of open revolt but rather of a
half-hearted and often uncomprehending shift to new cultural values and
[182] patterns. The effects are observable today in the tacit rejection of governmental
administration and external Euro-American social goals, and in the disorganization
of society and personality on the reservation.

175 Klamath history is well known since the treaty of 1864. Like many western
668 American tribes, the Klamath were ripe for the native messianic movements,
the cults which promised a return to the past and implied expulsion of the
European oppressor. An example is the Ghost Dance of 1870.[9] Here Christian

---

[825] [6] Gatschet, pt. 1, 131-132. Some informants suggest that the name for Crow or Raven,
Ka'äkemps, is the same as Kemu'kemps. This is doubtful, of course. Parenthetically, many
modern Klamath insist that there are no snakes in the Williamson River valley because all
were turned to stone by Crow's laughter.

[113] [9] Leslie Spier, *The Ghost Dance of 1870 among the Klamath of Oregon* (University of Washington
Publications in Anthropology, 2: 2, Seattle, 1927), 39-56.

Here Christian

175 elements, like the sign of the cross, were interspersed with native Klamath
668 traits relating to the shamanistic seance and to the aboriginal folklore. The
177 acculturation process also involved modification and integration of Ghost Dance forms introduced from adjacent tribes.[10] The growth of tribal, rather
[578] than hamlet, factions split the reservation at this time, and there was the pattern, familiar among other Indians, of chief rivalling shaman and of progressive against conservative. While the 1870 cult is one abortive attempt at native cultural revival, the post-contact history of the Klamath is replete with illustrations of a religiously conceived resistance to the disrupting pressures from without. Variously listed are the Earthlodge Cult, the Dream Dance, and several other revivalistic and messianic forms.[11]

175 By about 1900, nativistic movements on the Klamath Reservation had
177 burned themselves out. Tribal life of a half century ago was fraught with
[668] essentially the same problems which dog it today. People entered into economic competition in the greater society and became nominally Christian (and so
[797] lent Methodist sanctions to social institutions). However, the older values
[791] were only with difficulty accommodated to the new. One or two shamanistic practitioners survived but others felt that their power was gone. One infor-
[533] mant tells of her uncle, a shaman, saying sadly, "My songs (shaman power) have left me." Shamanism as an integrating factor in Klamath life and in that of other Pacific Northwest groups is reflected in another important
771 movement, somewhat different from the frenzied Ghost Dance. This is the
175 Shaker Cult, also a synthesis of native and Christian elements but with
177 longer range objectives. Originating in the north in the 1880's, it diffused slowly, reaching the Klamath in 1914.[12] Basically Christian in its orienta-
795 tion, the Shaker Cult admits a fundamentalistic Protestant eschatology; but in its emphasis on a "God is Light" theme, the employment of the cross as a particularly efficacious holy symbol, the use of bells, and the presence of curing seances, it assumed a peculiar flavor. Numerous aboriginal elements
[755] also are discernible.[13] Techniques reminiscent of shamanistic curing are employed (for example, the removing of causes of disease from the sufferer's body by means suggestive of shamanistic legerdemain), although the Shakers vigorously disclaim the older shamans, describe their work as of the devil,
178 and insist that the spirit of God effects Shaker cures. But the Shaker Cult,
771 too, although it enjoyed a following on the Klamath Reservation for some years, is dying. A few older people now meet in each other's homes for services.
795 The Shaker church at Chiloquin, Oregon, is now rarely used, and the younger

---

[10] Spier, 1927, p. 45. The Ghost Dance was evidently introduced from the Northern Paiute. The Klamath held that Kemu'kemps was coming from the south and that the dead were to return. See p. 53.

Frémont also remarked on the scarcity of their horses.[22]

Frémont reached Klamath lake again May 6, 1846. He commented [231]
on the outlet, Link river, "this is a great fishing station for the
Indians." His statement on the distribution of their settlements [226]
coincides with my information.

> They have fixed habitations around the shores of the lake, particularly at [361]
> the outlet and inlet [Williamson river], and along the inlet up to the swamp
> meadow [Klamath marsh], where I met the Tlamaths in the winter of '43–'44, [131]
> and where we narrowly escaped disaster. . . . . The Indians made me under-
> stand that there was another large river [Williamson river] which came from [133]
> the north and flowed into the lake at the northern end, and that the principal
> village was at its mouth, where also they caught many fish.

Frémont's party made a circuit of the lake. It is curious that he
does not mention the settlements about Pelican lake on the western
side, which he could hardly have avoided. On the other hand it is
not clear how closely his memoirs follow his diary. Attacked while [726]
on the western side, his party reciprocated by raiding a village on the
opposite side, perhaps one of those on Williamson river just above
the present highway bridge.

> Behind the sage-bushes where they had taken their stand every Indian had
> spread his arrows on the ground in fan-like shape, so that they would be ready
> to his hand. . . . . Quantities of fish were drying, spread on scaffolds, or hung [252]
> up on frames. The huts, which were made of tall rushes and willows, like
> those on the savannah above [Klamath marsh], were set on fire, and the fish [342]
> and scaffolds were all destroyed.[23] [726]

The first invaders remembered by the Klamath came from the
north about 1835. The stories about them have now a legendary flavor. 173
The first group was mounted; the Klamath dubbed them mpĕ'tkoŋks 437
(from mĕtc!a', to pack about) from their roving habits. An alterna- 648
tive name, pásai'ūks (French-Canadian in Chinook jargon), more
surely identifies them. During their brief stay at the mouth of
Williamson river they bought fat dogs of the Klamath, which to the
latter's amazement, they ate. For these they gave buttons and metal
disks with a central perforation (wika'lkal).

Almost as early was a white contingent moving northward on the 173
west side of Klamath lake. The Indians watched them unseen. They 648
were impressed with the horses, axes, and the food of the whites. 177

---

[22] Frémont, Narrative, 122.

[23] Frémont, Memoirs, 483, 484, 494.

173 When the latter broke camp they left behind a little flour, which the
177 Indians carried home and divided. They rubbed it on their palms and
[302] smeared their faces.[24]

648 Other early whites came from the southeast on horseback. This
marked the beginning of the great migration by way of the Modoc
648 country to the Pacific slope. On the whole the Klamath came off
remarkably well in their relations with the whites. The full brunt of immigration was borne by Modoc and Pit River peoples. The Klamath were spared the Oregon wars of the fifties, which all but annihilated the tribes of western Oregon and northern California.[25] The earliest white settlements in the neighborhood were about the present Jacksonville, Medford, and Ashland. The first white settlement within Klamath territory was near the village of kowa'edi at the northern end of the lake. This was about 1860–65, hence may have reference to the first agency established there. Subsequent relations have been on the whole quite amicable. The Klamath took no part in the Modoc war of 1872–73.

Habitat

131 The territory of the Klamath is on the high plateau of eastern
133 Oregon, in the shallow basin wherein lies the group of lakes that give
rise to Klamath river. The southern half of this basin about lower Klamath and Tule lakes is Modoc territory, extending southward across the lava beds in the direction of Pit river. The northern half, which lies against the Cascade range, is the home of the Klamath.

The Klamath properly reside on Klamath lake (or as it was formerly known, upper or middle Klamath lake), on Klamath marsh,
[361] and on Williamson river, which connects them. At least, most of the
permanent winter settlements are on these three waters, with a scattering on their tributaries. Summer camps are established over a much wider territory, as far, it would seem, as the natural limits of this drainage area.

---

[263] [24] Salt was equally unknown to them at this time.

[25] A somewhat obscure account was given me of the inclusion of Klamath in
[174] the great round-up of western Oregon Indians on Siletz (?) reservation in the
fifties. These had been wintering at the Dalles and were herded with the Indians there. The Upland Takelma and Molala were penned in together and
[648] fed by the soldiers. Some died every day; the Klamath suspected that they
were poisoned. The Klamath were kept apart, and, thanks to the strenuous arguments of their chief Lalc'ks, were not only freed but supplied with beef and an escort of soldiery to conduct them back to their own country.

by the death of several on each side, the feud continues until payment 726
is made. Continued feuds prove disastrous, for retaliation is carried 628
out with all the intensity and destructiveness of a foreign war. Villages are attacked at dawn, houses and property destroyed, women and children carried away into slavery.

A chief may intervene; so I was told, though I doubt it. Chiefs do 728
accompany parleying parties and other men may echo their words.
Beyond that there seems to be nothing to their position but personal 622
prestige which has been enhanced by developments since reservation days. Lɛle'ks and his successors among the ä'ukckni seem to have made much of their position. Pat's father and Tc!i'wi, both du'kwakni, killed a iu"lalong man at stŏ'kmatc, Eagle Point. They were taken to Klamath marsh and each beaten five times at the order of this chief. This was in pre-reservation days, or at least prior to the establishment of the agency in 1864 (?). Nevertheless this is not aboriginal, but, [177]
according to Nancy Phillips, these "laws" were brought by her cousin from the north.

The group that owes recompense, having lost fewer men, goes to 728
the other offering payment to even the score. The value of a man's life is not a fixed item, as it is for the lower Klamath river tribes; this despite the similarity of marriage payment and the slur on children not born of a purchased mother. My informants professed ignorance of what should be paid, yet it can hardly be doubted that recompense accorded with a man's wealth and prestige.

Children who are captured are kept; settling the score does not mean that they are restored, though this may well be only in case they have been sold. Their fate depends on their captors, who may elect to rear them as their own children. More commonly they are miserably treated, made to sleep with the dogs, fetch water, etc., and beaten if they are lazy. They are as quickly sold at Warm Springs and the [437]
Dalles as are foreign captives. With the latter at least there is an advantage in immediately disposing of them, that they do not grow up to carry back to their own people precise knowledge of the habits and topography of the Klamath world.

Kŏ'hdiŋks of du'kwa was a chief (lŏ'ki) in warfare. He would tell his tribes- 159
men to get ready to fight with the iu"laloŋkni, for instance. He was always 701
in the forefront of battle. When a youth he went out to seek power by bathing
and wandering through the mountains at night. His mother had told him that 721
long before those of iu"lalong had slain his father, Lɛ"l'wis, a du'kwa shaman
accused of poisoning one of them. He wanted to become a warrior to have

After the dance, scalps and trophies are usually preserved by those 727
who called the dance, relatives of the avenged man. They are dried 535
and stored far from their homes to be brought out and danced over at
each new scalp dance. Sometimes bits of the scalp are sewn in rows [177]
down each breast of a woman's dress, a Plains custom impossible, of
course, before the introduction of these Plains-like garments. Both [291]
practices are un-Californian.

There is a question whether the notched rattle (ulo'ks) is played in 727
the war and scalp dances. Neither drums, which the Klamath formerly
lacked, nor rattles are used. Only one man, Ma'gai', whose day was 535
well before the middle of the last century, knew the notched rattle. 534
He knew all about war. He had overheard the Upland Takelma
singing to it, according to one informant, and always used their songs
when the Klamath made war on them. No resonator is used; the
notched stick is rested directly on the ground and rasped with
another stick.[34]

CHIEFTAINSHIP

Chiefs are of but minor significance in Klamath life. In contrast 622
my informants invariably stressed the importance of the shamans. As 756
an instance the largest house pits pointed out were always those of
shamans. This relative unimportance of the chiefs was true at least
until just before reservation days. At that time contact with the 622
Columbia river tribes, whose concepts of chieftainship were sharp and
deeprooted, coupled with the developing trade which began to make
considerable differences in wealth among the Klamath, operated to
enhance the position of the chiefs, the rich men. It is significant that
Lɛle'ks, their most prominent chief, had spent several years of continuous residence at the Dalles. All this was sharply accentuated on
the establishment of the reservation by the government's recognition
of lay leaders while frowning on the shamans. It must be distinctly [114]
understood that the picture Gatschet draws of chiefly powers is non-
aboriginal.[35] In fact, his principal informant, David Hill, was one of [115]
the newly raised chiefs who, we must believe, was not inclined to
underrate his new importance. Both my best informants, Nancy

---

[34] The familiar association of this rasping sound with the voice of the frog and its use in a social dance (the Bear dance of the Basin Shoshoneans) are both unknown to the Klamath.

[35] Gatschet, 1:58–62.

His wife and children are commoners and not known by distinctive terms. 622

The emphasis among the chiefly functions is clearly on leadership in war and haranguing the people. Every morning before daylight he addresses them and again in the evening until the sun is well down. I am somewhat dubious that this procedure is as standardized as my informant had it. The address runs on fighting and acquiring spirit aid. He warns against hostile raiders; tells them to rise before daybreak; tells the young people to seek visions. "If you get a spirit, you cannot be killed; you will never fall sick; you will live to be old." But he has no word as to where they shall hunt or fish or carry on other routine activities. [701]

A chief has no speaker as a shaman has. Such might have been expected here, for Paviotso, Wishram, and Nez Percé chiefs have. [756]

A chief is not looked to to preserve peace. Old men may interfere in quarrels, but these are no especial concern of a chief. Nevertheless the word of an influential chief might end a feud. Just prior to reservation days the practice was introduced of tieing up and lashing quarrelsome men at the word of a chief. This was brought from the north by the cousin of my informant Nancy. It has a decided un-aboriginal flavor. A chief is under no obligation to help his people pay blood money, nor to assist them when starving. These are matters for relatives alone; they may die for all he is concerned. [7] * [177] •

SLAVES, TRADE, AND WEALTH

Slaves are captives of war, some of whom are kept by the Klamath but the majority are carried to the Dalles to be sold. They seem to have been numerous. Gatschet quotes a statement of Taylor in 1859 that in the raid on the Pit river people two years previously fifty-six of their women and children had been taken and sold on the Columbia river.[88] Doubt has been cast both on the number of slaves and the frequency of the raids as described by early writers. Kroeber, for instance, scouts the idea of yearly raids on the Achomawi and suggests that a few actual cases have been exaggerated.[89] Whatever the case be with regard to annual raids, I am certain that the evidences are too many and too circumstantial to permit of doubt that raids were 567

---

[88] 1:lx.

[89] Handbook, 319.

K
grown up among the Klamath, Klamath in speech and custom, were 567
not tempted to begin life anew elsewhere. Some, at least, had con- K
siderable prestige. Pit River Charley, for instance, a freed slave, [786]
returned from his people in 1873 with novel rites which were engrafted [177]
on the Ghost dance then newly come to the Klamath.[62]

Trade is probably of no great consequence within the tribe although K
it figures intertribally. Contacts were few and frequently unfriendly 439
until after the coming of the whites. The exception is the neighboring 221
Modoc groups; others are too distant. Winters are too severe for 361
travel and trade, but summers find the Warm Springs people in residence with the Klamath. These similarly set out for Warm Springs and the Dalles when the grass begins to grow, camping there in the open during the summer, and building mat-covered structures of
earth-lodge shape (wakĕ'ploks) if they stay through the winter. K
Slaves, Pit River bows, and beads are taken there to trade for horses, 439
blankets, buffalo skins, parfleches, beads (probably dentalium shells), 436
dried salmon, and lampreys.[63] Two slave children are valued at five 567
horses, several buffalo skins, and some beads. This is not far from the values recorded by Taylor in 1859; one woman was worth five or six horses, a boy one horse.[64]

K
The Molala are also visitors and are met on the headwaters of the 648
Rogue west of Crater lake. From them buckskins are obtained for
pond-lily seed and beads. Relations with the Shasta have not always [437]
been unfriendly; some of the Klamath Falls group and Modoc married S
with them, possibly only since the white advent. The nearest Shasta 131
settlements at Shovel and Jennie creeks can be reached afoot several K
days' journey down the Klamath. Laik'ĕlmi is a jointly occupied 648
fishing site somewhat upstream but below the Klamath canyon. Skins
and skin blankets are traded for Shasta beads. Dixon states that [226]
Shasta trade with the Klamath is slight.[65] [437]

In the period 1860–70 the few Shasta remaining in their territory congregated S
on the lower Shasta river and near the frontier town, Yreka. They were 131
reached by crossing the Black Mountain range. At that time this was a S
much mixed group, principally half-breeds. My informant Tom Lang, taken [302]
there as a youngster, remarked how he was afraid of their highly tattooed faces.

K
Intercourse and marriage went on freely with the Modoc. They
were visited on Tule and Lower Klamath lakes, and joined for the 648
fishing on Lost River near Olene. 131
226

[65] The Shasta, 436.

648 fishing on Lost river near Olene. A shallow bowl-shaped twined
[439] basket, called ķ!we'lu, is obtained from the Modoc, who in turn trade
it from Pit river. There is no direct trade with the latter people.

231 Horses were first acquired in any number about 1840. They had
• 177 been previously acquainted with them in the hands of whites who
crossed their country about this time; dates are uncertain. Ogden
in 1826 remarked on a single horse seen as though it was a rarity
231 among them.[66] The first sources were Warm Springs and perhaps
177 some group immediately east of that place. These were obtained by
chiefs; others were too poor in slaves to buy them. The name given
437 the new animal follows the common habit, wa'tcag from wate, dog.
Saddles (pā'olās) were first made of antelope hide. Here, as in the Plains, horses served as a stimulator of contacts, especially with the Columbia river peoples. As I have remarked, their introduction seems responsible for the rapid increase in wealth, the flow of northern ideas concerning social stratification, importance of wealth and of slave-holding, Plains costume, and those predatory habits which furnished the withal to maintain the new status.

237 Buffalo (yo'ho) skins are obtained at second hand; the Klamath
177 know that their origin is east of the Umatilla, that is, in Idaho.
Buffalo never ranged into this country, although they reached the
437 Harney Lake district. But very few skins ever make their way into
527 Klamath hands; only men with many slaves can afford them. They
are wanted to cover a gambler's hands in the stick game, an opportunity for ostentation.

177 Parfleches (sķö'psöli, folded up) are traded from Warm Springs
437 people and Sahaptins beyond them on the Columbia. They are not
415 made by Klamath.

Incidentally, many older people have fluent command of Chinook
*171 jargon. They, or somewhat doubtfully the Modoc, are the southern-
most people with whom this trade jargon is current. Kroeber remarks
437 on the fragments in use by Yuki and Shasta.[67] Naturally enough, it
191 served a purpose with the Columbia river peoples alone and was of but
small value with the whites coming from California.

556 It is interesting to know what constituted wealth among the Klamath, but with the old life now gone it is difficult to get direct evidence. However, certain things alone were spoken of when describing

---

[66] Elliott, Ogden Journals, 210.

[67] Handbook, 208, 319.

556

wealthy individuals. In approximate frequency of mention are slaves, horses, beads—and not always dentalium—food, archers' equipment, furs and hides, especially elk hides, Plains type garments, armor, large houses, buffalo skins, canoes. It is just as interesting to observe what things were not mentioned as valuable, or so to a lesser degree: baskets, nets, mortars, etc. In a word, articles of value in foreign commerce, articles of dress and adornment, of war, ritual, and sustenance, have value; domestic utensils have not. Some of the phrases describing wealthy men are illuminating. A war leader is chosen in part for his riches: he would own five quivers (five is the pattern number); he goes into battle with a quiver under each arm and one on his back. If his bowstring is cut he has another. A rich man has fur blankets, coyote and wolf pelts.

Dentalium shell beads do not function as money here as on the lower Klamath river. They are strung in fathom or half-fathom lengths, but neither length of string nor size of shell is standardized. The longer individual shells are more valuable but no one is known to haggle over the precise length as Yurok and their neighbors do. 436

MARRIAGE

A marriage payment is a social obligation. It is not a negotiated transaction as with the Yurok, Hupa, and Karok, for example, where indeed the social status of the family is measured in exact accord to the sum paid for the bride. Here failure to pay, which can be only a confession of inability, leads only to a lowering in social esteem. It is consonant with this that the bride is in no sense a chattel; she may leave her husband at will, and she certainly cannot be disposed of as a possession. Bride purchase is as inapplicable a term as can be found for the Klamath practice. In the interchange of presents which follows marriage the advantage lies most frequently with the husband's family. Payment constitutes an obligation, a seal of respectability. This is the well-nigh universal situation in North America if payments enter at all; it is a far cry from the commercial, contractual bride purchase of Africa, for example. The peculiarity of the Klamath is that failure to pay constitutes a social stigma. This is clearly explicable as a function of their geographic position, lying between the tribes to the west, with their clear-cut monetary evaluations of social relations, and the tribes of the Great Basin to the east, utterly devoid of any such sentiments. 583 [171]* [626] [177]

000

585
177 of any such sentiments. It also seems that the reciprocal visits by which the marriage is consummated, with their exchange of presents, is a reflection at a distance of the Northwest Coast potlatch, perhaps its most southerly extension.

582 Beyond the ability to pay, the choice of a mate is restricted only by kinship. No relative of any degree may be married; the children, they contend, will not survive. Common residence is for example no bar to marriage. Step-brothers and sisters, being unrelated, are free to marry even though they have grown up together. Several men now living here married their step-sisters. Sibling terms are not used between step-siblings, though they have half-brothers and sisters in common.

There is no village exogamy despite the relationship of most co-villagers. Yet there is a great deal of shifting residence especially among the several settlements of each division. Marriage within or without the tribelet is immaterial. Such evidence as exists however suggests that the tendency is for marriage within the subdivision. The data are few but summarize in this fashion:

Husband	Wife					
	ă'ukekni	du'kwakni	gu'mbötkni	iu''laloqkni	Modoc	Molala
ă'ukekni	8	1	——	1	1	1
du'kwakni	......	1	1	......	......	......
gu'mbötkni	......	......	1	......	......	2
iu''laloqkni	......	2	......	1	......	......

Of the ă'ukekni marriages among themselves, two above were with co-villagers, I have no data for other endogamous marriages.

Explicitly the data are the following: Pat Kane's father and his paternal grandparents were du'kwakni, his mother and her parents gu'mbötkni. These tribelets are more closely linked than with the others. His father lived at the time of his marriage at wudö'kän, a gu'mböt village north of Klamath lake; his mother with her people lived at sle'tsksi just across Seven Mile creek. Pat himself was born and grew up at mo'giqkånks, the du'kwa village at the mouth of Williamson river. His father's sisters married a man at iu''laloqx on Klamath falls.

Tom Long's father was white; his mother lived at iu''laloqx. Both her parents were also iu''laloqkni; her mother was related to Modoc and Shasta.

Nancy Phillips is ă'ukekni, born at k'taidi on Williamson river. Her father was ă'ukekni although he lived at du'kwa. His mother was of the du'kwakni. Nancy's mother was ă'ukekni of k'taidi village; her parents in turn both ă'ukekni, the father from k'taidi also, the mother from glä'tspaŁ'is on the opposite river bank.

[595] The chief Lalo'ks had seven co-wives; four, ă'ukekni, one each, du'kwakni and Modoc, and one from ne''lukni hence probably iu''laloqkni. Two of the

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

do keep up their ordinary occupation in part during this time. They dig roots for instance, but others must care for the products further, else the women will never find any more. 841

There is no comparable rite for boys at puberty. Nevertheless the time when a boy's voice deepens is recognized as propitious for seeking power. He is sent into the mountains for perhaps five days, to wander at night, running continually, piling up rocks, swimming in the mountain pools and eddies of the rivers, fasting the while until a song comes to him in a dream. He must use a head-scratcher. Preadolescent boys are tossed into the river or whipped while they sleep. If the boy whimpers he will be a weakling; he is expected to jump up and shout. I have cited above the case of Lɛle'ks who was so treated at puberty, it seems, and thus lost his transvestite habits. 881 [787] [866]

> When I [Pat Kane] was a little boy of seven or ten, my father sometimes threw me into the river while I slept. I did not ask why. Finally he told me, "I do not want to kill you. I do it so that when you are grown you will not easily get sick, so that if you are shot you will recover quickly." I always bathed in the river as a boy and you see that I have never even had rheumatism until recently. 866 159

DEATH AND MOURNING

Klamath funereal observances are personal, non-ceremonial, and somewhat unique in that they provide occasions for the seeking of power. There are no mourning anniversaries. 764 [765]

Cremation is the universal practice, even for suicides, the newborn, and the stillborn. Only the bodies of secretly aborted infants are buried in the bush. The body of a man killed in war is brought home for cremation.[98] [727]

> Some Klamath men were trapping in the mountains west of Crater lake about eighty years ago when they were met by some Upland Takelma who killed four or five. One boy alone escaped and made his way back to Klamath marsh at night. The Takelma took scalps, hands, and feet of the dead, and held a dance. Many Klamath went to fetch the bodies, which they brought to Klamath marsh for incineration.

Near each group of settlements is a spot where all cremations take place. It is somewhat apart from the settlements but not isolated.

> Three of these serve the Klamath marsh people; on the eastern side of the marsh near the towns k'ɛtaiwas (2, see maps, figs. 1-3), gŭpgŭa'ksi (3), and l'wal (4). For others of this division of the tribe, there is one on Sprague

---

[98] Cremation was given up forty or more years ago ("in about 1868," Gatschet, 1:86). The first burial was that of a Molala man, married to a Klamath woman, who was killed by a Klamath. [177] [178]

524

525 variety and one longer one are stuck into the ground before each group of players. These are called kee'ic, which, according to Gatschet, is derived from ksh'ena, to carry off.[116] Three of the sets described by Culin have each six counters.

The hider rattles the four sticks against the under-side of the hiding basket which rests on the ground before him and allows it to drop over them as he leaves them on the ground. The guesser must specify the order in which the sticks are arranged, which he does with a very characteristic gesture. If he is correct the sticks are thrown to him to hide. If he is wrong, the hider draws one or two small counters from his opponent's stock. The longer counter is taken last. For two arrangements, B and C below, he takes two counters; for A or D he takes one. The game is won when one side has all fourteen (no'ga, to win all the stakes; go'le, to win).

Each arrangement of the sticks has a name and a definite gesture which the guesser uses to describe it. He claps his hands once when his decision is made and brings his hand down or across in front as may be.

Name	*Arrangement*	*Gesture*
A. sḳo'tōs (?)	▮▮❘❘	Moves right hand to the right.
B. yo'sḳis	❘▮▮❘	Moves right index finger down the center.
C. sḳē'tc!ōs	▮❘❘▮	Moves first and second fingers of the right hand down the center.
D. woi'is (or bōḳe?)	▮❘▮❘ (or ❘▮❘▮)	Moves right thumb to the right to point out the thin sticks or the forefinger to the left for the thick sticks (reversing the movements for the second arrangement).

[114] Dorsey gives a somewhat different procedure. First, he is probably right in stating that for the opposite arrangement of A (with the slender sticks to the left) the hand is moved to the left. But he states that the guess for this position does not matter, since whether right or wrong, the sticks do not change hands and the hider gains no counters. Further, by his account, after a wrong guess is made and one counter forfeited, the hider arranges only one stick of each kind for the next guess. Both Dorsey and Gatschet give the name vuish, vū'ish to arrangement A.

524
177 The hand game is of recent introduction; of this all were in agreement. It was brought from the far north by a man called Spo'kăn, possibly one of that Salish tribe, before the Modoc war. He came from Warm Springs and married a Klamath. He introduced the accompanying songs as well and its name nai'ătia.[117]

[116] *Op. cit.*, 1:79.

[117] My informant had never heard the name lóipas recorded by Dorsey (*op. cit.*, 22).

276
756 rattlesnake skin. This may be used by the shaman only during the ceremonies, but I think not. The tubular pipe is not Klamath. A [177] long tubular pipe, with a small mouthpiece, found by the Indians at Pelican bay, had been described to my informant as the probable possession of a shaman who resided there. This is probably a trade piece.

MUSICAL INSTRUMENTS

534 The only true musical instrument known to the Klamath is the flute. This with three varieties of rattle and the hand drum make up the sum of their instruments. The musical bow is a plaything.

The flute (slo'lūs) is played for amusement and in courting; [562] curiously enough it is played by women as well as men even when courting. Its music is called su'lulu. Various sounds are imitated on 534 the flute, such as the noise of flying pelicans' wings. The melodies include those of shaman's songs, although it is never used in shamanis- 533 tic rites. I do not know that song is ever accompanied by flute. It [756] seems more probable that the melodies of certain songs are considered appropriate flute music.[141] There are flute songs about the turtle and deer. The song for the antelope is:

[539]

gaiyo'	gaiyo'wa	gaiyo'	gaiyo'wa
chewing			
tcĕwōm	aiĕ'nol	tĕli'dōŋga	
antelope	me	am browsing	
slewi's	aiĕ'nol	tĕli'dōŋga	
wind	me	am browsing.	

He browses along (toward me?) when the wind strikes him (?).

A flute song for the mountain sheep is:

hotūks	nis	sĕwā'ĕt	geoge'lɛ	wiĕ'sōm
that	allows	me	that earth	mountain sheep
dostōn	hoiha'nsɛ		lall'sdōt	
where I	run on the ledge		on the steep hill.	

These are not magical songs for calling game but solely for amusement.

Another song referring to any bird is:

djīkgasītgo	djīkgasītgo	nenea
flutterer		flapping.

---

[141] Gatschet gives the text of several songs, which, because they are neither appropriate to shamanistic or puberty rites, may belong to this category (1:189, 192).

534

This is the open flute, lacking tongue or reed, and played by blowing across the open end while it is held vertically or horizontally. So I was told, but it is more probable that the vertical is the only position used. These are manufactured from branches of the ḳoḳo'dŏm bush or the elder (slo'lŭsɛm), from which the pith is easily removed, or from the long legs of cranes. The wooden flutes are three-quarters of an inch in diameter, one to two feet long, with three holes (or four or five ?) for finger stops burned at odd intervals.

[881]

The deer-hoof rattle (sŏ'ḳtsŏḳs) is probably the only one of the three Klamath rattles that is of any antiquity among them. It is used exclusively in the girl's adolescence rites. The Klamath form is a slender pole four to seven feet long with a cord along the upper third to which bunches of deer dew claws (ḳ'o'djlŋks) are tied at intervals. The butt is pounded on the ground to jar the hooflets.

[786]
[177] •

Of the other two types, the clap rattle is the familiar cleft stick, the split end of which is struck against the palm. This was used in the Ghost dance of 1870 and in no other connection. It was derived from the Pit river peoples. The notched rattle (ulo'ks) is known to have been played by one man who learned it from the Upland Takelma. It may have been used in the war and scalp dances. This is the familiar notched stick set on the ground and rasped with another stick; no resonator is used.[142]

[177]

The hand drum has no great antiquity among the Klamath but was in use before the coming of the whites. It was derived from some northern tribe, probably those of Warm Springs. Its very name, bŏ'mbŏm, is the common word in eastern Oregon and Washington. It is used only in the social dances, which are themselves of no great consequence. The drum is the familiar shallow tambourine affair, with only one head. Thongs crossed on the open face furnish a hand grip. Drums are constructed of a flattened juniper bough bent into a ring of one to two feet in diameter. Heads of badger and antelope hide are best; they yield the loudest sound. The drum was not decorated until lately, when stars were painted on the head. This is said to have been learned of the whites, but is more likely derived from the modern version of the Smoḥallah cult, the so-called Pompom religion of eastern Washington and Oregon. The drum stick (wo'tanote) is a stick wrapped with mink hide to form a knob.

[531]
[177]

---

[142] There is no association of the sound with the voice of the *frog* nor with the rain, nor is it used in social dances, as in the Great Basin area.

[533]
[171]*

756

[622] [177] • The shaman himself is, or was, the outstanding figure of Klamath society. He had no rival in the chiefs, the rich man, until the coming of the whites brought a redistribution of emphasis in Klamath life. Chiefs had previously been persons of little influence.

771 *171 All this is familiar enough among Indians; the Klamath differ only in particulars. In its several aspects, their religion, as well as its practice, is one with that of the Great Basin, Plateau, and Mackenzie tribes.

THE POWER QUEST

787 The quest for supernatural aid is open to everyone, men and women, boys and girls. It is a constantly recurring feature of their lives. Everyone, perhaps without exception, seeks the powers at least once during his lifetime and further experiences seem to be repeatedly sought.

[881] The first occasion is always puberty. I doubt that boys and girls are expected to be uniformly successful in securing aid at this time, because, it was said, at shamanistic performances those who had power might sing their songs. This may imply that the others either never [765] acquired power or had lost it. My informants' frequent emphasis on the period of mourning for a husband, wife, or child marks this, too, as a peculiarly pregnant period when power may be successfully sought. At least at such a time a man loses his power and must seek [844] again if he wishes to regain it. A man also seeks power at the birth of a first child. But it is not only the crises of life that provide [756] occasion; the quest may be undertaken at any time, and it is the practice of such as gamblers and shamans to renew and enhance their [525] powers by frequent attempts. The quest is called spū'tu.

The experience does not ordinarily include a vision, but is made manifest in a song heard in a dream. In some instances where a vision is had, a dream song follows, but it is clear that the latter is the essential experience. In the following case a man and a woman had identical visions but to the man alone fell the experience leading to power.

787 159 The grandfather of a Klamath Falls shaman went to stō'kmōte, the point of Eagle Ridge, in the evening. There is a spot in the lake where bubbles rise. Horses lived in this long ago (!). When this man reached the headland he saw two pinto horses, with long manes, rearing against each other from the water. He was not frightened but took off his clothes and plunged into the water in order to secure power. When he recovered consciousness he found himself again on land. From that time he was lucky; he began to get many pintos, large horses. Because of this experience his grandson, the shaman, also acquired, in his turn, spirit songs of all kinds.

This is a spirit. Doubtful as spirits are certain other stones; yati's 776
which stands at I'wal, and nĕ'ḳnŭḳ, a group of stones back of
Du"llḳŭt, both towns on Klamath marsh. These are "shaman 776
stones"; evidently once living things, for it was said that they were 756
transformed when Crow laughed at them.

A Molala struck one of the nĕ'ḳnŭḳ stones with a basket, saying, "How can this rock have power?" He soon sickened and died. The nĕ'ḳnŭḳ is a shaman.

SHAMANISM

The shaman (ḳiu'ks) is one who has acquired more than usual 756
spirit power. This is a relative matter; some shamans have considerably more power than others, and everyone who has got power is in some degree capable of using it as a shaman does. One of my informants, for example, now avowedly a member of the pseudo-Christian Shaker sect, maintains that he too is a little qualified; he can make it rain. Shamanism is completely individualistic among the Klamath; there are no shamanistic organizations.

It is clear that the shaman is the most important individual in 756
Klamath society, taking precedence over rich men, the chiefs. Shamans' houses are the largest in the village and they have at least as 622
much property as wealthy laymen. Invariably my informants spoke first of shamans in describing outstanding individuals. Their behavior and practices were readily formulated, whereas I experienced considerable difficulty in learning the functions and even the names of chiefs.
It is reasonably certain that the status of the chiefs, that is the rich [178]
men, was relatively unimportant until the introduction of horses in
the middle of the last century stimulated trading with the Columbia [177]
river tribes and perhaps brought in some of the northern view of the importance of wealth and chieftaincy. There is no doubt that the position of chiefs was strengthened by the habit of the whites of dealing with chiefs and other prominent laymen.

Shamans are both men and women, but unlike the Shasta, the 756
majority are men. My informants mentioned many men shamans
during the course of my visits, and this probably did not exhaust 562
their memories; but on request they could muster only four women [170]*
shamans and one berdache. Women never acquire the prestige of men for they are rarely credited with such unusual powers as men. They cannot wander in the mountains nor dive for power so well as men;

756 292 [302]

(?) buckskin shirt, and wrist and neckbands of weasel. Some shamans wear a necklace of grizzly bear claws. (Other men never wear bear claws.) His face is painted black. Then he is powerful to cure, sawi'gan gī'na. Gatschet describes a band of otter skin worn round the neck and bearing various shells, feathers, bird scalps, etc.; hence it "must unite the magic powers of them all."[161]

Some articles of shaman's regalia are in the collections of the Field Museum. A bear-skin cap (no. 61563?) consists of the head skin, decorated on two or three sides with circular disks of buckskin ornamented with quillwork. These are one and three-quarters inches in diameter, and bear three concentric equidistant rings of quillwork, the most central containing a cross of the same.

A shaman's wand "used in curing ceremonies" (no. 61676) is a three-foot shaft bearing bunches of feathers bound on at two points, with a bundle of dew claws tied to the butt. The feathers are gray; they are bound at points about one-third of the distance from each end of the shaft. The bindings and the shaft have been painted red. The dew claws are pendant on individual thongs, each of which is wrapped with quills at two points.

291 292 [177]

The prescriptions affecting the dress of the laity at the shamanistic performances are illuminating. Everyday dress, at least for wealthier individuals, is of the Plains type; moccasins, skin shirt, long leggings, and breech clout for the men and long skin dress for women. Poorer people wear skirts of tule or buckskin and are barefoot. But the latter garb is obligatory at these dances. This is clearly another instance of conservatism in the field of religion, for the marginal position of the Klamath to the area in which Plains garments are worn, and the known recency of manifold contacts with the Plains-like tribes of the Columbia suggest that Plains dress is a recent acquisition. The hair hangs loosely down the back but is tied about close to the head. As usual basket hats are worn. Dancers, however, wear hats made of animals which are spirits.

756 784

Taboos and other restrictions on shamans are only feebly developed. A shaman must avoid a menstruant woman; in fact, women who live in a shaman's house must leave their homes at these periods, whereas otherwise this is not usual. Etiquette requires that anyone crossing the lodge must pass in back of a seated shaman, at least when he shows signs of communing with his spirits or is eating. This holds whether a performance is going on or not. Otherwise blood gushes from his mouth and he falls unconscious. One informant had seen this happen to the berdache shaman White Sindey while she was eating. The result is the same if anything falls in front of a shaman. There are

(ca. 1860-1900) NR10 Klamath NR10

755 patella. One is allowed to burn completely; when the other is half-consumed the sufferer destroys it with a pinch and throws it away, telling it to carry off the pain. The dry bark of the black sage is used for this, chewed and shaped into conical pellets. One informant showed me some prepared from the sage-brush bands used by mourning women and deposited in the trees, which he had gathered. Another informant denied that such bands alone are used.

Rheumatism is also treated with skunk grease rubbed into the affected part and the flesh of the animal eaten.

Earache, deafness, and hemorrhage of the ear are treated by the application at night of poultices of cooked wild parsnip root.

Toothache is kima'dj p'an, ant eats, or literally dŭt ansma'sz. It is so called because on breaking an extracted tooth they find in it a little worm with a black head, believed to be the larva of the ant, which has been eating the tooth. The sufferer rests his aching face on a stout stick, a paddle for instance, while he sleeps. Some one strikes the paddle a sharp rap; the sleeper is frightened and the aching gone. Pat Kane ascribed this to the Klamath marsh-Williamson river division (ā'ukckni) alone. The river-mouth people's (du'kwakni) method is to chew a bit of rotten fish, holding it on the aching tooth. The cure of the Pelican bay group (gu'mbŏtkni) is a cautery over the spot "breaking the tooth." Nancy denied the last two methods. Teeth are never extracted.

751 The Klamath used dog flesh in order to avoid smallpox (gotķ!ōks, erupting) on at least one occasion. This was during a winter before the birth of my informants, now in their seventies. Many died because they had so few dogs. Ordinarily dog flesh is avoided, but on this [177] occasion the flesh was eaten and the grease rubbed on the body. Considering the date[166] it may well be that this was a cure learned from French half-breeds on the Columbia.

278 For mumps, the root of a plant called sķōssķōtkgla'ks is rubbed on the swelling. (This waist-high plant grows near the river, is blue topped, with large green leaves.) Mumps has no native name because of its recency.

For colds the root of the yayo'ķaķ plant, found in the mountains, is chewed and swallowed. A poultice of this is also applied to a swelling, then covered with pitch.

---

[175] [931] [166] Powers states that about 1847 smallpox killed 150 Modocs (Tribes of California, 254). This is the widespread epidemic of that date which led to the Cayuse uprising against the Whitman mission in southeastern Washington (Hodge, Handbook of American Indians, 1:224). Taylor mentions its presence on the Humboldt and Bear rivers, Nevada, prior to 1853 (Taylor, Oregon Bound, 147, 155).

on the other. The blade is turned parallel to the canoe at the end of 501 each stroke. The size and shape of the blade are well adapted to his position so low in the water, for the stroke is effective and splashless. At intervals he dips his hands to prevent blistering them on the paddle handle.

A punt pole (lɛkö'ķ) is also used, especially in the shallow marsh. This is eight to ten feet long, with the lower end split and held open by an inserted wooden block. The punt pole is a young lodgepole pine (wä'-kō), stripped of bark, according to Coville.[286]

Sails are not used on canoes.

Anyone may make a canoe. Even a widow may fashion it for herself. One such had seen her father make them many times when she was a girl. Naturally skill varies very much.

Rafts or balsas, formed of large bundles of tules lashed together, were used, according to Barrett,[287] particularly by war parties. These were paddled with the hands.

Alternative methods for winter transportation may be noted here. It is customary to pack on the back through the snow, not to fashion a sled. But something of the sort is used over ice, a bundle of willows, called spi'klōs.

VARIOUS MANUFACTURES AND TOOLS

Woodworking is undeveloped among the Klamath, whereas it 322 might have been expected that the expertness of the Yurok or the Wishram would have made itself felt here. The only noteworthy uses of wood are for dug-out canoes, rough planks for the earth-lodge roof, and carved figures set up by shamans. The planks are only rough segments of hollow trees; the canoes are without fineness of line and crude in craftsmanship. Northwest Coast social organization [177] rather than craftsmanship has left its mark on the Klamath and their neighbors.

Fire is more rapid and effective in trimming large masses of wood 313 than the stone and bone tools at their command. Hence it is gen- 372 erally used for felling trees, cutting logs to the desired length, and shaping canoes, but it is customarily used for smaller objects as well, such as pointing a digging-stick. When they wish to fell a tree, a deep notch is cut into it at the base with elk-horn pick and maul. A

[286] Notes, 89.

[287] Material Culture, 256.

285
[222] sifting basket is used to screen seeds such as wokas, "as a grater to remove the skins of roots and tubers,"[343] or as a larger beater. The ladle serves to scoop floating wokas seeds from the surface of the water. The seed beater and sifting baskets are made of willows, or of split juniper roots; the ladle of tules. Each of these is made of a group of warps bent into oval shape, the central portion filled in with additional warps, and the whole woven in open twine by a continuous weft passing back and forth across them. One example examined is eighteen inches long with a maximum breadth of nine. The three fundamental warps, which are bent in a loop, are each comprised of two willow rods. The first few additional warps are fastened in by doubling them and twining them over the proximal end of the three fundamentals. The weft, a doubled willow twig, is then twined across the warps now in place, beginning at one side of the proximal end of the basket. Reaching the edge warp it is brought back across the structure for a second row, and so on continuously. A second set of additional warps is inserted by doubling them around the second row of wefting. Where further warps are needed to fill a space, wefts are transformed into warps as described for the conical burden baskets. The loose ends of the warps at the distal (handle) end of the basket are bound into two bundles, which are further bound to each other, to provide a grip. Essentially this construction is in a basket figured by Barrett in which the two bundles of warp ends are bound together to form a loop handle.[344] When fine seeds are to be beaten, a pad of twined tules (later horse hide) was inserted in the bowl of the seed beater.

An example in the Field Museum collections (no. 61785) is peculiar in that the warps are not kept parallel, as in other specimens, but are bent in zigzag fashion from one weft round to the next, so that the final appearance of the fabric resembles diagonal wicker work.

[177] Recently the Klamath living at Yainax on the eastern part of the reservation have learned to make sifting baskets in imitation of their neighbors, the Northern Paiute. An example I collected is of the same general nature as the Klamath sifters, but broadly elliptical rather than ovate. This is woven in compact diagonal twine, regularly crossing the warps in pairs but occasionally carelessly slipping into three warp stitches. The warps are willow twigs set close together, the wefts split willow twigs. The underlying construction is the

Woven bags for storage purposes, such as holding wokas and other seeds, are called wa'klo and t'a'yis. The former are of the size and shape of our pillow cases and made with warp and weft of nettle cords; the latter are of tule. Barrett records that the latter were so large that, filled with wokas seed, one alone was sufficient load.[248] Gatschet names two sizes of sack, wi'llishik (the larger sacks generically) and w'aχoks. The former holds fifty pounds of seed, the latter twice that amount.[249] Perhaps these are made in the same fashion; my information applies to the former. These are flat bags. The warps are doubled at their midpoints, so that one end will form the warp on the nearer side of the bag with the other half as warp of the other side. The weft is a simple twine stitch woven continuously around the bag, i.e., first on the nearer side, then passing to the other, and so on. Weaving begins at the points of doubling of the warps so that the bottom of the bag is closed, a mere fold in the fabric. Modern examples of this type of bag are woven in diagonal twine, but this is in imitation of fabrics of the whites. One such specimen alternates rows of diagonal twine with wefts inserted in tabby-weave.

K
*[171]

Certain flat bowls called k!we'lu are not made by the Klamath, but originate among the Pit river peoples who trade them to the Modoc. These are of solid twine weave and highly decorated.

Coiled basketry is rare among the Klamath. In fact, I was told it was never made, yet the same woman informant gave the following description of the water basket (name unknown to her). This is a bucket-shaped affair, possibly twelve inches high, with a mouth diameter of ten inches. It lacks a bail. The coil has a two-rod foundation of split tamarack twigs (wa'ku), sewn with tamarack roots (wa'ku ᴇmwä'wŭk). Stitching is on the nearer face, proceeding from left to right, working from the outside. That is, the coil is counterclockwise to one looking into the mouth of the basket. This bears no designs, nor is it painted. It receives a coating of pitch on the outside

K
• [177]

to render it watertight. I suggest that this type of basket is of recent introduction in imitation of Northern Paiute technique, although their baskets have constricted necks, I was told. Coiling is called slič'nsis, sewing.

NP
285

The Northern Paiute also make coiled bowls on a two-rod foundation, although they normally use a single rod. These rods are round willow twigs; split willow is used for the sewing. The foundation rods are so placed that the

(ca. 1860-1900) NR10 Klamath NR10

343 as in "one big family." This is inevitably a matter of personal preference;
252 some dwellings have two cooking lodges attached, the families
592 eating separately and sharing food only as friendship dictates. The
mortars and grinding slabs are kept in the cooking-lodge. The intro-
[177] duction of flour has wrought a change in these habits. Loaves of
bread are baked in the ashes in the earth-lodge itself. Flour is always
[262] shared among the inmates. I was assured that there was no earlier
custom resembling this.

264 But two meals a day are eaten, morning and evening. I was also
told that there is no regular period for meals. Visitors are given
574 something on their arrival, such as a little pond-lily seed, but no stress
is placed on this phase of hospitality. A sort of grace is said before
eating.

352 The entire floor of the earth-lodge or summer mat-house is carpeted
with mats except for the space within the four central posts. Thicker
piles of these for beds are placed all around the walls, but the best
352 locations are at the sides (*O*, fig. 19). Children might sleep in the
corners. People always sleep with their feet toward the fire, no
513 matter in what direction their heads then lie.[374]

Beds (slai'is) are of mats of various sorts. Rich people use tule, the twined mats (slai'is) being preferred to the sewn (st!ōps). One or more of these laid on dry grass serves as a mattress, or they sleep directly on the grass. One or two more form the covering. The few who have them use grizzly bear, coyote, wolf, lynx (? slowa'), or deer pelts, or several *Bassariscus* (? slĕt) skins sewn together, for mattress and blanket (sa'walc). A blanket for a little child is made from the skin of a red fox, a stretched raccoon skin, or several marten skins sewn together. Blankets (called sōlŭmtai') are also made of tule and cat-tail twined to produce a checkerboard decoration. Others are made of tules with the wing feathers of water fowl (pelicans, geese, swans, ducks, etc.) caught in one face. These are called lă'cdălap'ö'tᴇ, wing feathers (lac) put together. Another type of feather blanket (called ḳ'a'lyᴇ) is made of the dried skins of waterfowl twisted with a cord to form a fluffy rope. This is twined with cords inserted at intervals to form the blanket. Pillows (sᴇ'o'lhas) are a heap of grass, or anything else, even wood, but the wooden headrest of the lower Klamath river tribes is unknown. Gatschet records a sack stuffed with mallard duck down for a pillow.[375]

---

[374] I could find no notion that a sleeper is affected by moonlight.

[375] 1:144.

CLOTHING AND ADORNMENT

Costume is scanty for both men and women. Poorer individuals 291
are equipped with simply a fringed skirt and nothing more beyond 291
basketry hats. The wealthier, however, affect a dress which strongly
resembles that of the Plains tribes. Such men are clad in breech- 556
clout, leggings, moccasins, and on gala days buckskin shirts; women,
in the long dress of Plains type, with short leggings and moccasins. 177
This Plains costume seems to be of recent introduction; traditional feeling to that effect is reflected in the proscription of its use during shamanistic performances and in the Ghost dance of 1870–73. This might also be inferred from the fact that the Klamath represent its most westerly extension, or nearly so, in this quarter. Plains influences have reached the Klamath through the Columbia river tribes, with whom direct contact dates only from the beginning of the last century. We may hazard the guess that this costume does not date back before 1800 among the Klamath, and is perhaps not so old.

The fringed skirt is a garment which completely encircles the 291
wearer's waist, not an apron nor two aprons. It is formed of tule, or sage-brush bark, or possibly of buckskin strips, braided in cords which hang thickly from the belt. These pendants are closely set at the front and back, and hang but scantily over the hips. Distinctive names for the front and back parts (respectively hlsci'ska, hangs between the legs, and hlstco'llc, hangs behind) suggest its relation to the familiar two-apron garment of California. Men's skirts do not reach the knee; women's hang below it.

The man's shirt (tculi's) is of the Plains poncho type. This is a large skin with a hole in the middle, put on over the head. It reaches to the upper thighs and hangs loosely over the arms, without any attempt at sleeves, but is tied together under the arms. When only small skins are to be had, two of these are sewed together along the shoulders. Front and back are the same, the neck hole is round, and they are indifferent as to which side hangs in front.[279]

---

[279] A shirt illustrated in a photograph shown me had deep fringes along its lower border and on the seams joining the sleeves to the body of the garment. The sleeves indicate that this is a modern derivative of the old garment. I was told that a fringe is sometimes placed horizontally across the chest. A man's shirt in the collections of the Field Museum of Natural History (no. 67883) has a short fringed opening down the breast from the neck hole, and a border of beads on the low collar rising around the neck.

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

291 The familiar triangular flaps below the neck in Plains shirts are
[756] lacking. Shamans alone paint their shirts, others who attempt it
would be poisoned by them. The designs are spots, circles, and lines,
[531] not pictures. While I do not know the character of these designs,
this suggests the protective shirts of the Ghost dance of 1890. Inas-
[177] much as we must assume that the shirt reached the Klamath from the east, and it is possible that Plains influences are quite recent, it is possible that the shirt, or at least its decoration, came only in Ghost dance days. Nor are shirts worn at all times; they are too valuable, "they might wear out"; which represents their unusualness in the view of the Klamath.

Breechclouts (haewi'skis) are made of buckskin, and nothing else. They are worn by women too, but not with the buckskin dress. It seems that the flaps which hang over the belt are short, for they are said to be long only if the skin happened to be long. The belt is only a thin string, presumably a leather thong, for poor people make it of the soft bark of the tule.

Men's leggings are thigh-length or calf-length (called respectively
[184] snásni'ks and mldĕ's);[330] women wear only the latter. These are of buckskin or fur, but poor people make them of tules. Barrett illustrates one of the latter sort made in twined technique. The full-length leggings are tied to the belt at one point, the hips. In a photograph shown me, little deer dew claws were hung pendant from the front of the leggings just below the knees.

Moccasins are worn at all times by the men, at home or when traveling, whereas women sometimes go barefoot at home in the summer. For the most part, moccasins are woven of tule or swamp grass; very few are made of skin. Barrett observes that the buckskin moccasins are for summer wear, the winter ones of tule.[331] This is very probably the case, as the tule affair is intended primarily to hold a layer of dry grass next the foot.

Tule moccasins (wipgá') are made in open twine. The fabric is brought together over the toe, but is quite without a heel. A cord laced through the loops along each side draws it up around the foot.
[171] They resemble those of the Paviotso.[332] For traveling they make
[531] moccasins of this type of swamp grass, which is stronger than tule; those for home use are of tule and bear decorations.

[332] Lowie, Notes on Shoshonean Ethnography, 218, fig. 5*b*, *c*.

291
[171]*

The skin moccasin (dŭmi'wẕ) differs from that of central and northwestern California, in being made of two pieces. Like the Californian affair, it is a one-piece moccasin in pattern, with a seam up the top from the toe and another up the heel, but it also has a D-shaped inset over the instep which is continued upward into a tongue. Some specimens have an additional strip around the ankle, sewed to the edge of the main piece, and which can be worn turned up or down. The drawstring passes around the ankle and across in front of the tongue.[383] Moccasins are made of deer or elk hide,[384] with the hair inside, or even of beaver or badger skin. The last is a very strong skin; the moccasins will last a year or two. (Otter and raccoon skins are not used.) Cut to pattern (fig. 21*a*), they are folded lengthwise, stitched up the instep, across the toe, across the heel, and up the heel. The tongue (stai'skŏpk) is then sewed in over the instep. The procedure in connection with sewing the heel is peculiar. The slit *A–A* is first made; the sides brought together so that the points *A*, *B*, and *C* match; the cross seam (*A–A*) sewn, then the vertical one (*B–C*). This leaves a loop inside the moccasin at the heel. The moccasin is then turned inside out, so that the loop is on the outside. The corner of this is then cut off on the lines *D–D*. This forms a tab protruding at the heel. These seams are not lapped but sewn with a through-and-through stitch, hence when the moccasin is turned inside out, the seams at the heel, at least, are on the outside. Sewing is done with an awl and sinew.

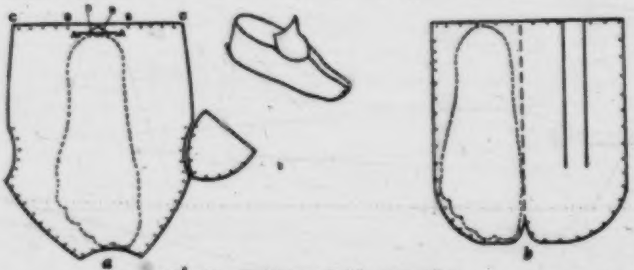

Fig. 21. Patterns of skin moccasins.

[177] •

Another type of deer-skin moccasin (wŏkcna') made in imitation of Warm Springs and Yakima style, has come into use since the boy-

---

[383] Illustrated by Barrett, pl. 17.

[384] The same informant stated on another occasion that elk hide is not used for footgear.

291
177 hood of my elderly informant. This is a simple one-piece affair, shown diagrammatically in figure 21*b*. The upper is cut to form a long tongue. It is sewn along the toe and one side, and up the heel.[265]

481 Snowshoes may be conveniently described at this place. The snowshoe (ni') is the circular Californian form; a hoop of tough service berry wood, about twelve inches long by six wide.[266] Within the hoop is a net of thongs on which the foot is placed; tie strings are drawn up about the ankle. My woman informant drew a sketch showing five parallel longitudinal thongs crossed transversely by five others, [114] also parallel, thus forming a simple rectangular web. This may well have been merely diagrammatic, since five is the pattern number. Kroeber illustrates a more intricate pattern of webbing, a central lozenge filled by transverse lashings and connected with the frame by others.[267] Barrett illustrates a snowshoe with still a third style of web. This seems to be a single longitudinal strip of skin, crossed by three others.[268] Such shoes are also used when wading in the marshes.

291 Mittens (wäkä'pks) of coyote or other fur are worn in cold weather, possibly by men alone. They are also used for protection in war. [714] These are sock-like, without fingers, and of arm or elbow length. A muffler (sau'kaks) is also made of skin.

291 The woman's skin dress (gokc) is the long woman's garment of the Plains tribes, completely covering the body to the mid-calf. 177 Unlike the corresponding man's shirt, these are worn most of the time, especially in winter. In summer the lighter unbeaded dresses are [535] used. This is not essentially a dance costume, although worn at the war and scalp dances. But these are held outdoors at night; and [756] during the shaman's dances in the earth-lodge, the fringed skirt only is worn because of the great heat. It is possible, of course, that this is a rationalization of etiquette, for if the shaman's dance is older than the forms of war and scalp dance now in use, there may be an association of the older fringed skirt with one and the newer skin dress with the other. There can be little doubt that the fringed skirt is the antecedent form. Plains influences appear to be recent, and

---

* [171] [265] This has been redrawn from a sketch made by my informant. On the Yakima reservation moccasins of this type have a tab at the heel, which my informant may have omitted.

[266] Coville (Notes, 94) states that "the frames of snowshoes are usually made of willow wood. The mesh in old times was commonly made of the Rocky Mountain flax, *Linum lewisii*, less commonly of nettle fiber, *Urtica breweri*."

[267] Handbook, fig. 68a; evidently taken from Mason, Aboriginal American Basketry, 215.

[268] Material Culture, 255, pl. 17.

291
177

the Klamath use of the typical Plains woman's costume is an extreme marginal case in the west.

Being of buckskin, not of elk hide, two skins are necessary for the dress. These are sewn together across the shoulders, leaving a short space for the insertion of the head. The neck ends of the skins are always across the shoulders, since this is the widest part of the skin. The contour of the dress is the familiar one, the natural contour of the dressed skin with the legs lopped off. Cape-like extensions, formed by the skin of the forelegs, hang loosely over the arms. All the edges are slit into fringes and the front and back are tied together by these under the arms and down the sides. These are not belted in Plains style.

291
114

A woman's belt made of strips of bark fiber is illustrated by Barrett; others are made of human hair.[illegible] While Barrett is probably right in stating that these are part of everyday dress, I was told that the belt (k'ai'lls) is worn at the puberty dance, when a first child is born, or when an infant dies.

291
531
[177]

The dress of earlier times had no ornamentation, but it now has the yoke-shaped decoration of Plains type and rows of pendants. The yoke is not a separate piece, but the quill-work design, and in more recent days the beadwork, is applied directly on the dress. Formerly rows of elk teeth were sometimes used. There is no special name for the yoke; like any beadwork, this part is called Iti's or Ita'ntkos. The yoke of one dress seen dipped below each armpit and again markedly at the middle of breast and back. It was comprised of a series of horizontal stripes in beads of contrasting colors which paralleled this wavy lower margin of the yoke. Three horizontal rows of pendants crossed front and back; one following this lower margin, another just above the knees, and the third near the bottom of the dress. These pendant strings, which hang in pairs, are wound with colored porcupine quills; thimbles and Chinese cash are sometimes threaded on them. A deep fringe (bowi's) is sometimes made to fasten along the lower margin of the yoke, at the bottom of the dress, and around the short sleeves. This is fabricated from a piece of buckskin, nine or more inches deep, slit into fine fringes so as to leave them connected by only a half-inch strip of skin. Beads may be strung on these. Similar strips of fringe are attached to a man's shirt. Hair that is cut off in mourning is tied in little rolls all over the dress; a man uses

(ca. 1860-1900) NR10 Klamath NR10
Northern Paiute NR13

K
301 length is "a little too much." The unit, according to one informant,
is the length of the extended left arm to the upper end of the humerus,
or across the chest in addition to the point of the right shoulder. The
other gave the unit as a doubled string from the extended left hand
K to the sternum; that is, a fathom. One thing is clear, that there is
[436] no great concern for dentalia as money, as among the lower Klamath
tribes. The strings are not standardized either as to length or size of
the individual shells. Long dentalia are more valuable than the short,
but my informants never knew anyone to argue over the precise length
of a shell. Both men agreed that the several kinds of beads, or at
least the best, are not worked by the Klamath, but come from the
K south. They are either found in raided Achomawi-Atsugewi camps
[721] or are traded from these people or possibly the Shasta. Both were
[439] certain that the shells are not obtained from the north. This is something of a puzzle, because the Columbia river people have dentalia and
[177] use them extensively in trade. Furthermore, the ultimate point of
origin of the shells is the coast of Washington and British Columbia.
[174] The discrepancy in the statement is further accentuated by the Yurok
statement that the shells came to them both along the coast and down
the Klamath river.[399]

K
[189] Finger rings are not made, nor bracelets, except for young children. The cast skin of a water snake is wrapped around their wrists
so that they will swim well.

K
302 Face painting is general, a daily usage, not confined to gala events,
but more obvious at that time. The shaman's body is painted red
during his winter performances. Red is the color in general use,
[756] white only at dances, and black alone in mourning. Those who go to
[822] war paint themselves red, not black, with their faces white. I have
pointed out elsewhere[400] that red paint is associated with warfare by
the Basin tribes and their Californian and Arizonan neighbors. Here
it may be added that black is used by Plains warriors. At dances
white pigment, found along the creek banks, is smeared on the palms
K which are then pressed on the face or on a woman's smooth hair to
[317] form patterns. Red paint is difficult to get. It comes from a few
localities in the mountains near Crater lake. The Northern Paiute
NP are said to have quantities of it, however.

[317] In winter women smear their faces, hands, and arms with a mix-
K ture of charcoal and pitch, or deer grease, or of pitch and grease

751

[400] Havasupai Ethnography, 207.

802

60, nōtaksōpt dō'nkni te'ēwūnip.
70, la'pksōpt dō'nkni te'ēwūnip.
80, da'nksōpt dō'nkni te'ēwūnip.
90, nōtakā'ēks dō'nkni te'ēwūnip.
98, nōtakā'ēks dō'nkni te'ēwūnip pe'ēn da'nksōpt.
100, te'ēwūnipni te'ēwūnip.
101, te'ēwūnipni te'ēwūnip pe'ēnas.

The numbers eleven to nineteen are abbreviated forms, the full form for sixteen, for instance, is nō'taksōptial'ᴇ ha te'ēwūnip ōnt.

Even without extended etymological analysis, which I am not prepared to make, the basis of this numeration is transparent. One to six, nine, and ten are individual stems; seven is based on two, and eight on three. This suggests a quinary and decimal basis. From twenty up the basic count is by tens. Intermediate integers are so many tens plus the units, as in English. The exception is such an integer as twenty-one which looks like "two tens plus." Why the form for sixty and above differs from the lower round numbers, I do not know.

These numbers are used in counting all classes of objects. Gatschet remarks that classifiers "are appended to the numeral to indicate the shape or exterior of the objects counted."[411] The only other number I found was a score, the ten fingers and toes together, na'sat. There are no similar collective terms for the fingers of one hand or of both. Only a circumlocution can be used, like lugawa'wals, the fingers, or pĕtcō'mnᴇlugawa'wals, the toes all together (pĕtc is foot). Ordinarily the ordinal numbers are not used in counting the fingers; one does not usually say one finger, but specifies it by name. The toes are enumerated like the fingers.[412]

The following list of colors was recorded:

822

tōktō'kli, red.
tlo'tlalwi, green.
mĕtcmō'tcli, blue.
spa'lptcli, yellow.
kōp'kauli' brown.
bō'cbōcli, black.
ba'lbali, white.
ge'lōpel, gray (English, gray ?), means dirty.

My informant said that the word for blue was in use before the coming of the whites; she denied that there was a single word for blue-green. This implies that the familiar blue-green confusion was lacking here. I did not test any of these people for their color sense with color-wools.

[177]

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10
Southeast Salish NR19

This is undoubtedly true equally of all the tribes lying in the Columbia K
drainage from the Rockies to the Cascades. It is known to be so of 262
tribes as far apart as the Wishram and the Lower Kutenai,[413] and of 171*
others lying between, as the Middle Columbia Salish and the Nez Percé
in their original condition. K

The Nez Percé case calls for explanation. The present culture of 171*
the Nez Percé is Plains-like. But there can be little doubt that much, 105
if not the overwhelming part of the Plains traits among them, dates
only from the introduction of horses into the Snake-Columbia basin, 177 •
sometime between 1750 and 1800. With the horse came not only horse
gear and all the elements of Plains nomadism, but the opportunity for
buffalo hunting and trading on an extensive scale in the Plains. Many
of the Snake-Columbia tribes began to make periodic visits beyond
the Rockies from this time. Teit's account of the Middle Columbia SS
Salish makes it quite clear that prior to the coming of the horse, 114
typical Plateau culture, practically devoid of Plains elements, pre-
vailed over the entire area. Even the picture of life among the Nez 105
Percé and their neighbors presented to Lewis and Clark as late as 177
1804–6 was far more that of the Plateau at large than it is in our own K
day. The earlier situation is largely obscured by the fact that the 171*
Yakima and Klickitat in their eastern Washington location have many
Plains-like features. Teit's investigations make it reasonably certain, 105
however, that the situation prior to the end of the eighteenth century 177
was quite different. At that time eastern Washington to south of the
Columbia river was occupied by Salish tribes with typical Plateau
culture. Subsequently the Yakima-Klickitat moved northward, prob-
ably from east central Oregon, to their historic habitat.[414] It seems
reasonable to assume that up to that time they, like the Nez Percé, had
little in the way of Plains culture. K

Even today the food habits of the Sahaptins are not those of the 171*
Plains. What I am suggesting here is that the balance of vegetal 177
products and fish, now nearly even, rather favored fish in the days 178
before hunting was so readily followed. 262

So far as general habits of life go, the river culture of the Klamath K
links them also with the tribes on the lower reaches of the Klamath 101
river. But their food habits do not quite coincide. Yurok, Hupa, and K
Shasta all make a larger use of acorns than of fish, although observers 171*

---

[413] Chamberlain, Kootenay, 183.

[414] Teit, The Middle Columbia Salish; a map showing the early distribution is included in Haeberlin, *et al.*, Coiled Basketry in British Columbia. 262

Taken as a whole Klamath material culture is of Plateau type with 171*
strong leanings toward northeastern California. But their social and 101
religious culture has a different aspect. While basically of the
extremely simple Basin-Plateau type, social habits reflect the Northwest 105
Coast, religious ones rather those of northern California and
western Oregon.

The basis of Klamath religious experience is that of the northern 171*
interior, the Basin, and the Northwest Coast, in distinction to California
and the Southwest. The experience is deliberately sought and 771
the power obtained is of a generalized, unspecialized nature. In this
they resemble as well the generality of North Americans. Even their
spirits are of the sort universal east of the Pacific coast. Specific
Northwest Coast influence appears in the circumscription of general
spirit repossession to the midwinter month. On the other hand, the
shaman novice's inaugural dance, which gives at least as much color
to Klamath shamanism, is characteristic of northern California and
western Oregon. The Klamath form of it is, rather, Oregonian.
Details of shamanism, on the other hand, link more firmly with
northern, especially northeastern, California.

Social organization is extremely simple, and it is quite patent that 171*
as late as the end of the eighteenth century, it resembled that of the
Basin and Plateau in every particular. Even now social stratification
is only weakly developed. Chiefs were only recently set off from the
mass, their functions vague and their influence slight. At the very 171*
moment that Klamath society began to break down with the coming of 177 •
the whites, they first imported from the Columbia river judicial functions
for the chiefs. Chiefs are the wealthiest individuals, but they 622
are not chiefs because they are wealthy. Their selection is still based
on principles of personal ability. The basis of this differentiation,
wealth, came from the same direction, but the accompanying principle
of the Northwest Coast, caste stratification, never reached here; nor
did the chief's adjunct, a speaker or advocate, although this functionary
is known in the Plateau and Basin as well as in the Northwest.
At the other end of the scale, slavery is apparently an old institution, 171*
but was of little importance until wealth began to figure among them. 567
The Northwest Coast concept of status based on wealth appears again
in marriage, here regularly by purchase. But social estimation did 171*
not rest on the amount paid, which was in fact very little. With so
slight an emphasis on rank and wealth, those northwestern corollaries, 556
local exogamy to maintain the one and the family compact following 584

*171 on the other, were entirely absent among the Klamath. Nevertheless
556 the mechanism of the Northwest Coast for the exchange of presents,
584 the potlatch, does appear here in the form of prescribed reciprocal
visits between the families of bride and groom. It has not been clearly
recognized that these features of Northwest Coast social life have
spread even farther from that focus into the northern Plains and to
north central California.

*171 Of the slender stock of Klamath ceremonials, the scalp dance is
widely known, the war or incitement dance is common to northwestern
535 California and perhaps all of Oregon. Kroeber has pointed out that
726 so far as California is concerned scalp and war dances are mutually
exclusive in their distributions.[418] But the Klamath, like all others
*171 of eastern Oregon, carry out both dances. The girls' adolescence rite
of the Klamath is one with those of western Oregon and northern
881 California. This is a local phrasing of similar rites known from
Alaska to the Southwest, but lacking east of the Sierra-Cascades.
Specific details of the Klamath affair are closer to northern Cali-
*171 fornian forms than to those of Oregon. The Ghost dance of 1870 was
evanescent among them. Its first form was that characteristic of the
original dance of Nevada; later it was overlaid by features char-
acteristic of central California.[419]

• 177 Some historical relief emerges in this survey. It is definitely
traceable in some details and can be established inferentially for more
basic elements. The most recent stratum of adopted traits is post-
[285] reservation, i.e., later than 1865. This includes two types of basketry
derived from the Northern Paiute settled on the reservation, a sifting
basket and a coiled water bucket, and the Ghost dance. The earlier
[668] form of the Ghost dance was instituted by the same group of Paiute
in 1870 or '71. This was the familiar circle of dancers, whose leaders
[343] dreamed new regulations; its ideology the return of the dead. In
1873 a Pit River introduced central Californian elements; a dance
[534] lodge, probably the clap-stick rattle, new songs, etc. To the same
[533] stratum belongs the imitation of the Warm Springs-Yakima one-piece
moccasin.

[291] Other elements are recognized as pertaining to pre-reservation
177 days, but probably not earlier than the middle of the last century:
the hand drum derived from the north, and perhaps the social dances
534 in which it is used; the hand game brought by a Spokane (?) man.

---

535 [418] Kroeber, Handbook, 144, 844.

[419] Spier, Ghost Dance.

The judicial function of chiefs, dispensing fines and punishments, is 177
known to have been derived from the Columbia river tribes at 622
this time.

Some trade articles not manufactured by the Klamath also pertain 439
to this era: parfleches, skin bags, and buffalo hides from Warm
Springs and the Dalles, flat basketry bowls from Pit river through
the Modoc, and beads, even dentalia, from the same southern source
or from the Shasta.

The second quarter of the last century saw the coming of the 177
horse. Ogden remarked on only one among them in 1826, but they
began to be obtained in numbers, probably from Warm Springs, about 231
1840. There can be little question that with the horse came elements
of Plains culture from the half-Plains tribes of the Columbia-Snake,
the adoption of predatory habits, and the great stimulus to slave-raiding
and to slave-trading with the people at the Dalles on the
Columbia.

Both tradition and inference assign Plains traits to this period. 177
The relative newness of Plains style of dress is attested by the incompleteness
with which it was adopted. It was never the universal garb, [291]
but confined to the wealthiest, and, most significantly, proscribed at
the performances of shamans and the Ghost dance. Further, men
did not wear Plains costume to war and set out on their raids afoot, [714]
even after the acquisition of horses, which suggests that the new
accouterment and habits had not taken firm root. The circular shield,
which also was never in general use, may well have come in at this
time. The earlier types of Plains garments here were only simply [291]
decorated or not at all. It is known that the elaborate beading of the
yoke and the use of scalps, etc., for appendages on women's dress, and [531]
the painted designs on men's shirts, are much more recent than the
first adoption of these garments. These local changes probably reflect
a similar transformation in decoration in the southern Plateau.
Possibly the dome-shaped sweat-lodge was introduced at this early [343]
period. It seems to have been displacing the small earth-covered
affair for some time. But the latter is also generically the eastern
type, not the Californian, and is without doubt older than this incursion
of Plains elements in the early nineteenth century. Finally, I
cannot avoid the feeling that the sense of tribal solidarity, in which,
even though but slightly developed, the Klamath differ from their
Californian neighbors, dates from this contact with Plains-like peoples.

177 At least one minor element, assigned by tradition to this period,
535 was derived from another direction; the notched rattle used in war
534 and scalp dances in imitation of the Upland Takelma.
Direct contact was opened with the Upper Chinook at the Dalles
174 only after 1800. By this time Snake raids had dispossessed the
Sahaptins of central eastern Oregon, driven them north of the
648 Columbia, and cleared the south bank of that stream by scattering
Cayuse-Molala east and west. Direct contact quite across Oregon
brought the Klamath in touch with the great trading center at the
Dalles and revealed to them the superior and stimulating cultures of
the Chinookan tribes and the semi-Plains groups from above on the
Columbia.

174 The whole rise of the chiefs, the growth of social stratification
177 based on wealth, the concern with slave-holding, all seem to date from
this time. Wealth began to be considerable: its form was new: horses
[556] and slaves. Chiefs grew in wealth and prominence over shamans.
The basis of their selection changed in some degree from war to wealth.
[622] Slave-raiding to the south increased in frequency: the booty was
[721] carried to Warm Springs and the Dalles.

It is doubtful if the material differences in wealth and slave-
[567] holding existed prior to 1800. Shamans were dominant over chiefs
and were but slightly more wealthy than the majority. The historic
174 tribal subdivisions were in existence, the village groups and their dis-
177 tribution established, and the basic social relations, as reflected in kin-
ship terminology for example, much as we know them. Marriage may
[756] well have been by purchase, but possibly without the pseudo-potlatch
custom of reciprocal visiting. Material culture was prevailingly
[622] southern Plateau in aspect, and religious practices, while more north
[619] Californian, had already some impress of the Northwest Coast.

[583] Is there a Lutuamian culture province? I am doubtful. Kroeber
has somewhat hesitatingly posited one, set off by a certain distinctive-
101 ness from that phrasing of Northwest Coast culture found localized on
the lower Klamath river, and favoring rather the Basin and Plateau,
105 to which the Klamath country lies open.

114 "The Lutuamian culture or subculture, as represented by the
Klamath and Modoc, corresponds well with this setting. It reveals
some specializations, such as its wokas and tule industries, that are
obviously founded on peculiar environment. There are some north-
western influences, but rather vague ones. The basis of the culture
is perhaps central Californian, with certainly some Great Basin or

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

*171 From this perspective the Klamath complex takes its place with
756 the relatively simple shamanism of the northwestern interior and the
Basin, overlaid with elements shared by tribes of the northwestern
coast and those of northern, or better, northwestern California.

Shamanism bulks large in the social scheme of the Klamath as it
does in the interior Plateau and the Basin, for the reason that competing
[881] rituals are lacking. Beyond the girls' rite, the war and scalp
dances, and for a brief time the Ghost dance, the Klamath have nothing
[535] but shamans' performances. The winter ritual of the Northwest
Coast extends only to central coastal Washington, the potlatch only
to the Columbia river. The wealth display dances of northwestern
[726] California do not penetrate even to the Shasta; those of the central
Californian Kuksu cult not beyond the head of the Sacramento. Elements
[784] of these ritual systems do indeed appear among the Klamath,
*171 but the dances as such are absent.

796 The Klamath hold the acquisition of supernatural power within
the reach of anyone. In this they accord with the generality of North
*171 Americans and differ emphatically from the Californians for whom
power descends only on the few. The Klamath form of quest followed
787 by a dream in which power comes links the common quest of
America with the dream experience of California. The Northwest
Coast, its interior, and the Basin are a unit with the Klamath in that
the quest is for power of a general sort, not for visions yielding specific
sanctions as in the Plains. The spirits whose benevolence is sought
are birds and animals as in the interior, the Plains and eastward, not
the mystic supernaturals of the Northwest Coast. The source of
power and disease among the northwest Californians, the "pain"
*171 objects, do not appear among them in any form. The Klamath concept
of disease is the very general North American one of intrusion;
753 the soul-loss concept of the Northwest Coast and tribes to the Columbia
is unknown here.

*171 The Klamath novitiate dance for shamans is shared by groups from
the Sacramento to the Columbia. It is the northern demonstration of
756 ability rather than the initiation and mastery of power of the northern
Californians. The repeated dance of the Yurok prevails through
Shasta and Modoc, but the single Klamath dance is of the interior
type.

*171 The Northwest Coast winter ritual makes its appearance here only
756 in its general aspects. Klamath shamanistic seances are held only in
midwinter and this is also the time for repossession by spirits among

796
• 177

171*

the people at large as well as the shamans. Inasmuch as both these features are northwestern and non-Californian, they must be looked on as influences from the north. 177 756

The following sections attempt to substantiate these generalizations. 796

Spirits

Those spirits of which the Klamath seek power are conceived as animals, birds, reptiles, fish, sometimes as natural phenomena, and in a few instances as supernaturals, anthropomorphic and akin to the characters of their mythology. Their number is indefinitely large. Each may be said to constitute a genus of spirits; e.g., "the Coyote spirit" is properly a group of coyote spirits. Members of the class are not singled out for individualization. 776

The spirits of other tribes of the northwestern sector are of the same type. All the interior tribes on into California and all others of Oregon for whom we have information hold to this conception: Thompson, Lillooet, Wishram, Nez Percé, Takelma, Klamath, Modoc, Achomawi, Atsugewi, Maidu, and Wintun. There are undoubtedly differences among them in the type of spirit most frequently sought; thus, natural phenomena bulk larger in the Thompson mind. Further, objects, some as trivial as the nipple of a gun, figure as spirits among the Thompson, Lillooet, Snohomish, Nisqually, Nez Percé, Achomawi, and Atsugewi.[636] 171* 776

A concept of a different sort holds sway on the coast from Vancouver island to the Columbia river. There the principal spirits are supernaturals of mythological character. These are necessarily restricted in numbers since they are highly individualized, and correlatively the powers they bestow are particularized. Where information is available, these creatures are credited, as among the Klallam, with a social existence of human pattern: they live in houses, are provided with servants, and travel in canoes. This is the predominating spirit concept among the Kwakiutl, Klallam, Snohomish, Nisqually, and Quinault. The slight information on Chinook spirits suggests supernaturals of the same sort. This is not to deny that animals and birds figure among the Klallam and Puget Sound Salish, and that among the Quinault there are a few bird spirits that retain their

000 lows, (2) larger cradle for older infant, same shape, material; with or without hood. WT, WM: (1) Cradle used for newborn infant. (2) Cradle for older infant. WT: Cradle slenderer than one sketched in Du Bois, Wintu, fig. 8j, p. 133. WS: Only 1 type sitting cradle used.

1343. SE: "Never have used basket toe-type cradle; that's Happy Camp (Karuk); in old days those Happy Camp people never came up around Yreka."

1344-1346. Mo: Refers to cradle for newborn infant (see note 1342-1352).

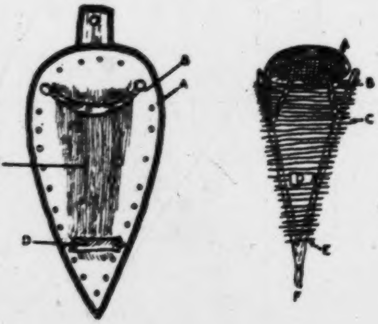
1348. Mo: Refers to cradle for newborn infant.

1349-1350. Mo: Refers to cradle for older infant (see note 1342-1352).

1351. Mo, SE: Refers to cradle for older infant.

1352. See note 1364a. Mo: Refers to cradle for older infant. SE: Cradles for newborn, older infants both have leg rest. Cradle for newborn infant has separate soft tule bed and leg rest of rolled grass. Cradle for older infant has piece of tule mat, rolled, as leg rest. "If you don't have that seat (roll) on, child will slip down and choke." At, AW, WM, WS: Bed on cushion at bottom for infant to sit on; no transverse-bar leg rest.

854 1353. Kl: Three types of lying cradle used:
(1) Tule cradle for newborn infant. (2) Willow
cradle for older infant. (3) Board cradle; said
[17] to be of comparatively recent (pre-white?) in-
troduction among Kl, but informant did not know
from what tribe it was borrowed. Type (2)
cradle only used if type (3) not available. Kl
000 refer to all their cradles as of lying type, but
infant can also half-sit in them. Mo: See left
figure. "The board is new, after Whites' time."
At: See right figure. Specimen seen; adopted



(Left) A, holes to pass lashing through; B, hoop for cradle hood; C, separate tule bed; D, cross-bar rest for infant's legs.

(Right) A, hood of basketry; B, basketry splints (?) to support hood; C, transverse rods, to form bed; lashed to frame with sinew; D, leg rest; E, forked stick frame; F, point to stick in ground.

[195-A]

000 1612. MM: With burnt pepperwood gourds.

[301] [304] [177] 1614. Kl: "Nose plugs and earrings are new; the Klamath learned to use them from the Molala Indians and the S [California] Indians. They never made holes in their nose and ears in old times." SW: Awl used chiefly to pierce noses; sometimes point of quill, but latter makes too small a hole. WM: Male, female mourner if desirous of inflicting loss on others similar to that he has experienced, retires to small sweat house (Lut) and pierces nasal septum with small manzanita stick. Addresses bloody stick, telling it he wishes other persons to die; stays in sweat house 6-7 days, leaving stick in nose until hole has healed; then takes out stick and gives it to relative, shaman usually, to keep and use in poisoning people. WS: By sick persons only, occasionally.

Deformation, mutilations.--

[304] 1617. Kl: See note 1614. SW: Porcupine quill used; keeps ear lobes from becoming sore.

1620. At: Men, women. AE: Women.

[304] [177] 1621. Kl: Learned to tattoo from Shasta (Achomawi?) when informant boy (ca. 50 years ago). "Two Kl women went [S] to see Shasta; when they returned, 1 old woman tattooed herself" with 3 lines on chin radiating from mouth; "people saw it and liked it, and lots of old women did it then. The first old woman thought it made her look pretty." Informant had also seen 1 old man, with circles tattooed under eyes, and connecting line over nose, but "didn't like it; it looked funny." Men's tattooing on arms also recent custom. Mo informants confirmed slight use of tattoo by Kl; commented upon how heavily Shasta tattoo. Mo: Recent (?). SW informant denied Mo, Wintu women tattoo; however, Mo informant attributed tattooing to Tule Lake Mo groups. WM: Little tattooing among WM; if tattoo very much, spirits will take person away. More tattooing among Trinity, Weaverville Wintu groups (Nomsus).

1622. AW: Boys occasionally only. WT: Men on arms, when wife dies only.

1625. WT: 3 narrow stripes put on girl's chin; vertical lines across cheeks added later, when girl is grown woman.

1626. WT: See note 1625.

1627. WT: Women.

1629. SW: Upper-arm marks to measure dentalia; men, only. WT, WM: Men. WM: Men tattoo as therapeutic measure only.

[304] [422] 1633. Obsidian knife, generally. MV: With white rock, procured from river and smashed for sharp edge.

[757] 1638. Therapeutic measure; see elements 4473-4474.

1641. Mo: "Proud of eyebrows, eyelashes; wouldn't pull them." NS: Hot ashes applied; "eyebrows never grow back."

1642. NS: See preceding note.

1647. MV: Face rubbed with warm rock, so beard will not grow quickly.

1648. SE, WT, MF, NM: Rarely; old men only.

Dress

Headgear, robes.--

291 [184] 1713. Kl: Brim on men's caps, painting of men's caps, denied for Klamath Marsh groups (see Spier, Klamath, pp. 182-183). WT: "Worn at Willow Creek [Hupa] and on McCloud River [WM], but not among WT." WM: Upriver people [WS] give WM women basket caps occasionally.

1715. See Spier, Klamath, fig. 13,c, p. 180. Specimen of Kl woman's basket cap shown to all informants to verify this element.

1718. AW: If man wears basket cap, he is ridiculed. AE: Never worn by men.

1723. Worn in winter. SE: Feathers attached
000 to it. AW: Brimless.

1726. SW: Worn habitually by men to keep hair down, as women wear basket cap. Not used for packing, as men pack on shoulders.

1729. WM: In war, or war dance; covered with duck skins.

1730. SW: Used by shamans, but not by ordinary persons, except for dances (see element 1943). MV: Tule band to keep hair back.

1734. SW: "Goes with Big Head dance."

[226] [292] 1735. Kl: Tule mat (ste'holas) 3 ft. wide, 4-5 ft. long, used when fishing in daytime on ice; fisherman covers head with mat "to make it dark underneath so that he can see into the water plainly." At: Tule eyeshade woven, "like blinders"; projected from each side of wearer's head; tied on by band around head. Informant's husband used such when fishing for trout in boat at night so light would not get into his eyes.

1736. Mo: Charcoal mixed with pitch.

1737. MV: Used commonly in cold weather, especially by women when outside pounding food.

1741. At: Used in rainy weather by few people only.

[291] 1743. Kl, WS, MM: Worn thus by men and women. Mo, At, AW, MF, NM: By men only. SE, WT, WM: By women only. (See note 1744.)

1744. SE, WT, WM, NM: Worn thus by men. At, AW, AE, MF: By women.

1747. AW: N of "real" Achomawi, group at Dany (Suk'mawi) use bearskin caps. But "real Achomawi were river Indians; they stayed around the rivers, fished; every man had a canoe, and belonged to the river. They went out [hunting] for a little while, then returned to the river."

1749. Mo: Puma "costly" robe.

1750. SE: Beaver hides. WS: Worn by men and women.

Shirts and gowns.--

1751. SW: For everyday wear women's dress consists of 2 whole buckskins, seamed up both sides, tied over both shoulders.

291 439 177 1752. Kl: Bought women's buckskin dresses from Molala, NW of the Kl, and the Warm Springs Indians. "The Molala made them, the Kl bought them, and learned how to make them. That was quite a long time ago, about 90 years; long before the

177 291 439 Modoc War [1872-73]. There were no White people in the Kl country yet, or at Portland. The Kl traded with the Molala and the Warm Springs Indians and the Yakima; the Warm Springs and Yakima had more horses; the Kl had only a few." SE: 000 From Warm Springs Indians. "Those Indians up there are much smarter. The SE traded bone beads [dentalia] for women's buckskin dresses and men's shirts from them; SE went N and got otter skins for button [clamshell disk] beads."

[291] 1753. Varies, according to size of woman wearer. AW: 2-3 skins. WT: 1 skin, if from big buck.

1755. WT: 2 front legs used to tie skin at back of neck.

1757. Crude-type dress, little better than 2 whole skins, tied together over shoulders and at sides, to cover front and back of wearer.

[291] 1758. SW: Tied at shoulders, but not at waist.

[177] 1768. Kl: Glass trade beads.

[531] 1770. SW: Men's everyday shirt. At: "Atsugewi men wore buckskin all the time; that's why they called him rich." AE: Recency of buckskin shirt denied.

[177] [291] [439] 1771. Kl: Men's buckskin shirt acquired from Molala about same period as women's buckskin gown (see note 1752). SE: See note 1752.

1772. MM: 1-2 skins.

1773. See note 1757.

1780. SW: Sleeves, of elbow or wrist length, sometimes set into armholes, especially for winter wear.

1784. At: Lacking on buckskin shirt, but 2 bone beads sewed onto front of poncho-type shirt (see element 1785).

1785. At: Worn by Madesi Achomawi also.

Loin coverings.--

1786. SE, SW, At, AE: Worn by men, women. WT, MM: Worn by men. SW: Women wear breechclout underneath skirts, but never use it as sole garment, as men often do. AW: All breechclouts (i·čiti) pass between legs, but different methods of tying them at waist; some are tied at sides. AE: Whole buckskin, legs left on; trimmed narrow where it passes between legs. Ends pass over belt tied around waist; flaps hang down over belt in back, front, "like little aprons." Men, some women wear them always; women generally in summer.

1787. SW: Breechclout made from smoked buckskin, tanned soft. If wet, rubbed and reworked until soft again. Flap of breechclout falls down in front over belt.

1788. SW: For makeshift garment only.

1793. MM: Worn in summer.

1794. MF: Tanned, with hair removed.

1795. According to size of woman.

1796. Skins sewed or tied together; tail left on back skin.

1798. MM: Winter only.

1801. SW: Informant credited Kammatwa and Katiruk groups, between Shasta proper and Karuk

[199-A]

000 filling pipe from his tobacco pouch in turn and passing it. Smoker makes loud guttural noise as he smokes.

2067. AW: Most popular time for smoking, but "some old men smoke in morning, after eating, or any time."

2068. SW: Do not smoke in dwelling, where women living; pipe will be defiled by woman's presence and be worthless for use when making medicine, preparing to hunt. MV: Seldom smoke in dwelling house; chiefly in assembly house, before going to sleep.

2069. Middle-aged, elderly men; not young men.

2071. Mo: In small amount, as medicine, for nausea.

2072. Kl: Offerings not, however, lacking; see note 5197. WS: Occasionally smoked as an offering; "not much."

2075. AW: Shaman smokes, blows smoke and his "poison" (animate object) in direction of victim, telling poison: "Now go." WM: Smoke tobacco to mountains when praying, worshipping. WS: See note 2072.

MUSIC AND DRAWING

Musical Instruments

Drums.--

534
177
2076. Kl: Formerly lacked drum; "learned about it from groups to N [before informant born]. Kl used to go N, to the Dalles; there they saw the drum, and how those people used it. (They danced with it. Sometimes the Kl visited up there 1, 2, 3 years.) They brought back the dance that they learned from those people, and the drum. Lots of Kl went over there, before the white people came to this country; they weren't trading except that they took wokus [water lily seeds] and gave it to some Indians over there, but mainly they were just friends." Cp. Spier, Klamath, p. 89. For details of dance with which drum was introduced among Kl, see
000 notes 2529. SE: Double-headed, circular hide drum, hanitomtomiL. Consists of 2 circular willow hoops, ca. 6 in. (?) apart; top, bottom, sides buckskin covered; buckskin covering sewed to willow hoops. No specimen seen. Beaten to call people to assembly house. "One Indian [SE] used to make this drum, in my grandmother's day." Probably recent but pre-White, as Spier suggests for Kl (Klamath, p. 89). SW: Informant believed drum old but could not assign any use for it; not used in gambling, as it is among Karuk. AW: "Mo had a drum, round, with antelope-hide head; painted red; held in 1 hand. They came here from Tule Lake; some people used that drum here, at Stonecoal and Big Valley." AE: Recency of drum denied.

2083. See elements 834-838 and notes, especially as regards WM entry. MV: Besides foot drum,

[203-A]

000 also used board as drum. See element 3670; also cf. Densmore, Musical Instruments, pp. 114-115.

2084. AW: Basket drummed with pack strap, to frighten away bear. MF, NF, NM: Use of pack strap for this purpose denied. MF: Drum on basket, in night ceremony held during April, when men, women sing for good seed crops, plentiful game for year. NF: Men scrape, drum basket when singing in assembly house; no dance. NS: Taboo to drum basket; "must not play with a basket." MV: Basket patted with hands.

Rattles, rasp.--

[534] 2085. Kl: Spier (Klamath, p. 90) doubts whether any large cocoons in Kl area. SW, At, AW, AE, WT, WM, WS, MM, MF, NF, NM, NS, MV: Cocoons suitable for rattles available in area. WS: Cocoon rattle used for Big Head dance.

2088. At: 30* cocoons. AW, MM: 5-6. WS, NF: 4-5. NS: 3-5. MV: 5-10.

[534] [759] 2089. Kl: Shamans do not use any variety rattle. At: Cocoon rattle dangerous; shaman never keeps it in house, or shows it to people, except when doctoring. When he shakes rattle, "it is as though he is asking his power for help." AW: Poisonous for anyone other than shaman to handle.

2093. SW: Gray papery sack, ca. 5 in. long, 2-3 in. wide; neither cocoon nor wasp's nest, but resembling these, used as rattle; broken mussel shells put inside it; used by children.

2097. WT: Refers to single-split rattle.

2098, 2099. WT: Refers to multiple-split rattle.

2101. WT: Refers to single-split rattle.

2103. AW, WM, WS, MF: By shamans only. MM: Snake rattles regarded as poisonous.

2108. SE: 7-8 hoofs.

2111. Mo: Obsidian arrowheads shaken inside open-mouthed basket cap, to encourage men to go to war.

● [534] [177] 2114. Kl: 2 notched rasps, held in hand, "played like a fiddle." No basket. Recency denied. Cp. Spier, Klamath, p. 35.

Bull-roarer; whistles and flutes.--

[534] [177] 2116. Kl: Learned from Whites.

2120. At: Children, twirling bull-roarer for fun, ordered to stop, because sound produces sickness.

2130. Mo: Used when hunting ducks. SW: Used for any dance. WS: 2 types whistle; (1) of bone, old; (2) of elder, recent.

2131, 2133-2134. WS: Refers to older type bone whistle.

2136. WS: Used for Ghost (Dream) dance only; recent.

2147. Mo: Whipsnakes around elderberry bushes. See note 2161. SE: Also not good to handle elderberry bush; gives person headache. MV: Whistling with lips also taboo at any time.

2148. MV: Any variety of snake will come to whistler.

[203-B]

000 2334. WM: Refers to grass game. See note 2326.

2335. WM: Refers to recent many-stick game. See note 2326.

2336. WM: Refers to grass game. See note 2326.

2337. WM: Refers to recent many-stick game. See note 2326.

2339, 2341. WM: Refers to grass game. See note 2326.

2342. SW: Score kept orally. Counters are played with, as part of gambling outfit. WM: 15 counters for recent many-stick game; 20 counters used for old grass game. See note 2326.

2345, 2348. WM: Grass game. See note 2326.

Hand or grass game.--

524 2349. Among several groups, more than 1 type
hand or grass game played. Whenever entry refers
to one type only, note indicates to which type.
If entry refers to all types played by group, no
[179] note appended. Kl: Learned to play hand game
from Warm Springs Indians; also from Paiute;
latter "just natural gamblers." Game popular
among Kl before informant born. "Many new games
000 among Kl now." At: Type (1), old form of hand
game, similar to old Mo game (see note 2368).
Type (2), recent, 4-bone-type hand game, learned
from Kl. AE: Type (1), men's hand game. Type
(2), women's hand game. WM: Type (1) grass hand
game, Xeni. Type (2), recent form of hand game,
cu'us, introduced about 20 years ago, perhaps
from Stillwater area. "People from there came
and said, 'Let's play hand game.'" WS: Type (1),
grass game, k'eni, old. Type (2), "hand game,"
no other name. Recent, learned from Paiute about
30 years ago. Type (3), women's hand game, a·rus;
old. If men play type (3), use larger set of
bones. MV: Type (1), men's hand game. Type (2),
women's hand game.

2350. AE, MV: Refers to type (1) game. WS: Refers to types (1), (3). See note 2349.

2351. At, AE, MV: Refers to type (2) games. WS: Refers to types (2), (3). See note 2349.

2352. AE: Refers to men's hand game. WM: Refers to recent form hand game. See note 2349.

2353-2354. AE: Refers to men's hand game. WM: Refers to recent form. See note 2349.

2355. At: Refers to recent type. AE: Refers to men's hand game. See note 2349.

2357, 2359. AE: Some doubt concerning entry.

2360. AW: Unmarked bone is "live" bone.

2361. WM: Called "ace," in recent form hand game. WS: Marked bone called pak (bone) in women's hand game. See note 2349. MF: Called "string bone and slick bone."

2362. AE: Refers to men's hand game. WM: Refers to recent form hand game. See note 2349.

2364. At, WM: Refers to recent form hand game. AE: Refers to men's hand game, an old type but only recently played with bone or horn bones. See note 2349.

2365. AE: Refers to women's hand game. WM: Refers to grass game. See note 2349.

[205-B]

00D 2366. WM: Refers to grass game. See note 2349.

2367. AE: Refers to women's hand game.

2368. Mo: Fact that only 1 player at time holds objects causes Mo to distinguish clearly between their form of hand game (nanadeyes) and "Paiute-Achomawi" 4-bone hand game (which is also recent Kl form). This 4-bone form never adopted by Mo. At: Refers to recent "hand game," and women's hand game. WM: Refers to grass game. See note 2349.

2369. At, WM: Refers to recent form hand game. See note 2349.

2370. WM: Refers to recent form. WS, MV: Refers to women's hand game. See note 2349.

2371. WS: Refers to recent "hand game." MV: Refers to men's hand game. See note 2349.

2377. WS: Refers to recent hand game and women's hand game. MV: Refers to men's hand game. See note 2349.

2378. WM, WS: Refers to recent form hand game; also, among WS, to women's hand game. See note 2349.

2379. WS: Refers to grass game. MV: Refers to men's hand game. See note 2349.

2381. WM: 15 counters for grass game; 5 counters for recent form hand game. See note 2349.

2387. WM, WS: Refers to grass game. See note 2349.

2388. WM, WS: Refers to recent hand game and, for WS, women's hand game also.

Stick hiding; dice games; objects thrown in air.--

2399. AW: Single stick, piece of rock, hidden in bare hand (but not between fingers); 2 hands extended, hider sings short song. Opposite side guesses which hand contains stick; played merely for fun, between 2 women, or 2 boys, 2 girls; MM: Informant's daughter had seen it played at mission school at Greenville, Plumas Co.; father unfamiliar with it. NM: Name of game, tikil (see note 2435) or wotokit.

[524] 2406. Mo, MF, NM: Said to be aboriginal.
2410. Kl: Possibly learned from Paiute; beaver
[177] teeth. Mo: Ground-hog-teeth dice.
[237] 2415. NM: Informant positive no counters.

2429. MF: Deer bones.

2435. NM: Name of game, tikil. Informant had seen it played at Mooretown also, among MF group.

2439. At, AW: Women's digging sticks. MF: See NM note, following. NM: Name of game, tikil (see note 2435). Informant had seen game played at Mooretown also, among a MF group. Use of women's digging stick in game denied.

2445. AW: Sometimes 12 used instead.

2453. AW: Comparatively large rock.

2458. AW: 2-4.

2465. NF: For 3 days after gambling.

Amusements

Toys; contests; storytelling.--

2469. SW: Like Pomo top, Kroeber, Handbook, fig. 41,a, p. 449.

[206-A]

000 2475. MV: Shoe-leather disk, also top of tin can used for recent buzzers. Using buzzer "makes people sick; don't use it much."

2483. SE: Name for buzzer similar to that for bird that makes whirring noise at night; when playing with buzzer people say they "are making the deer fat."

2484. WM: "The puisus (Achomawi) play this, but WM never do."

2485. WT: Informant had never seen Indians play this; had seen Whites doing it.

2489. AW: Names of 2 figures: Sundown; Spider's House.

[524] 2490. Kl, Mo, SW, AW: Popular moving figure is that of "2 coyotes running from each other."

2492. Mo: If play in summer, ensuing winter will be severe.

2494. SW: Figures made during first quarter of moon, in spring especially, to make moon grow (by stretching string).

2494a. Mo: Both informants stated stilts aboriginal. At: "Danced on ice with stilts". Like Mo informant, At informant had used stilts as girl.

2505. WT: Willow-bark bag, sand inside.

2508. Mo: 5-6.

2520. Mo, MM, MF: Narrators presented with small amount of food by auditors; MS: uncertain about this; MV: denied. Not inquired into for other groups. MF: Myths told to youths, men only (during secret society initiation?); informant for this group a woman.

[538] [855] 2522. Kl: Belief held more in jest than in earnest; told to small children who "would never go to sleep."

2523. SW: If myths told toward spring, look out for rattlesnake.

[481] [883] 2527. Kl: Youths "made to swim in winter anyway"; no rule which applies to myth telling per se.

Social Dances

Circle dances.--

535 177 2529. Kl: See note 2076. Dance Kl brought back from N with drum was "a round dance; men and women danced, holding hands, men on 1 side, women on other of single circle, with fire inside in middle. It was held any time of year, but mostly in summer, just for fun. Given at night; people stopped dancing around midnight. [No leader who brought it back, or no data on such.] One man might say, 'Let's have fun'; people told each other; they came and danced. The drummer was the leader; he sang, and the men and women dancers sang too. The drummer stood by himself; just 1 man drummed. The [179] Kl no longer give this dance; the old people have mostly died." Mo: Dance relatively slight affair; 000 "a few young people assemble for 'evening joy' dance; join hands and go around fire in circle; old man watches them. When they become reckless, he stops dance." SW: Circle dance (k'aphek), an old summer dance, given for pleasure sometimes;

[206-B]

K M 342 of the house head, whose bed is toward the front, while an old
352 lady or two, perhaps his widowed mother, sleeps toward the
513 back. Along the opposite wall range the sleeping mats of another
K family, sometimes one related to the house head. There are
M [592] houses that hold more than two families and others that hold
K only one. The very poor together with the aged who can no
M 342 longer make their way up and down the ladders must be content
888 to shiver out the winter in mat lodges.

735 Many of the people of our earth lodge, and the younger women
K now bringing in the food which hospitality dictates be offered
M 142 the visitor[11] are of powerful frame—though of no more than
average height—and some tend to portliness.[12] They are scantily
K clad for this climate: both men and women clad in fringed fiber
M skirts and basketry caps, differing only in style. In the early
291 nineteenth century, a few would be wearing buckskin clothing
[177] and footwear of the style then being communicated down the
trade routes from the distant Plains across the Rockies and down
the Columbia. Those preparing to brave the weather outside
add tule leggings, woven tule sandals stuffed with dry grass, a
K mantle of skin or fiber, and fur mittens. Their hair is dressed in
M 302 braids, that of the men wrapped in the new fashion with strips
301 of otter fur. Both sexes wear necklaces of shells or stone beads,
ear pendants, and a dentalium shell thrust through the septum
K of the nose. Many have a flattened brow, cultivated in infancy
M upon the cradleboard; and several have designs on the face,
304 limbs, and body tattooed according to no particular pattern by
[142] rubbing charcoal into incisions or punctuations. The latter practice,
[177] says Ray, was a recent importation from the Shasta and Pit
River neighbors of the Modoc.

K Morning in the winter village comes early for the older boys.
M 512 Before sunup they are prodded out of bed by a father or grandfather
[857] and sent for a roll in the snow, a plunge in the frigid black
waters of the stream, and a run upon its banks. By the time the
sun climbs above the snow-laden trees, women have begun to
stir, arranging their hair, raking up the fire, lifting a baby on its
K M cradleboard to nurse. In the cooking lodge, others are heating the
[252] stones that, dropped into a basket of mush, will soon cause it
[415] to boil. The watertight cooking baskets are treasured, for they
[177] have come in trade or as loot from peoples to the south. Families

I was informed were sold for three horses each, some cheaper."[6] 000

In the changing conditions of the early nineteenth century, K
the Klamath were caught up in currents generated from without. 175
The advent of horses and of firearms made it possible for the 177
tribes of the east-central Plateau, the eastern Salish and eastern 648
Sahaptin, to cross the Rocky Mountains, to hunt buffalo and [231]
enter into relations, both peaceful and bellicose, with the tribes [411]
of the Plains. As they came under Plains influence, the appeal K
of Plains garb, of parfleches and tipis, grew.[7] The Klamath were [291]
attracted to these new goods, and the clothing at least came to [556]
replace or supplement traditional forms of wealth.

Moreover, the horse and the gun had revolutionized warfare K M
patterns. Although traditional enemies beyond the Cascades 175
were preoccupied with white settlers, on the east the Paiute were 177
gradually developing mounted bands of great mobility and 726
striking power. The Klamath and Modoc were not slow to seek 231
the new instruments of war. 411

The opening trade to the north brought a corresponding K M
intensification of the raids carried south into the territory of the 175
Pit River tribes—the Achumawi and Atsugewi—to capture women 177
and children, Pit River bows, and other loot. As Chiloquin, one 721
of the leaders of the time, recalled:

> When the Snakes [Northern Paiute] made war on us that made us keen to fight other Indians and we made war without provocation on the Pitt Rivers, Shastas and Rogue Rivers, but they never made willing war on us. Those wars lasted a great many years. We found we could make money by war, for we sold the provisions and property captured for horses and other things we needed. It was like soldiers nowadays who fight for money. We made war because we made money by it and we rather got to like it anyhow. The Snakes provoked us to make war on them.[8]

With developing warfare and the accumulation of foreign K M
wealth came a gradual transformation of Klamath, and to a 175
lesser extent, of Modoc society. The forays into hostile country 178
enlarged the scale of the war party. Chiloquin speaks of a body 726
totaling one hundred warriors, which included, according to Spier,
members of all the Klamath tribelets, and took in some Modoc as
well.[9] A joint raid on the part of Umpqua, Upland Takelma, and
other western tribes brought one such retaliatory reprisal about

Modoc NS17

[Klamath Reservation]

K

M
175 1850. Aggressions by Northern Paiute bands led to similar large-
178 scale forays into the country east of Silver and Summer lakes.
726 The almost endemic condition of warfare and the enlarging
K M scale of operations, together with the lucrative trade in booty,
175 brought about the emergence of a chiefly class, the members of
726 which based their power upon eminence in war and possession
182 of wealth, including slaves.[10] Their successes attracted followers,
622 and common interest as well as kinship prompted them at times
565 to cement alliances with shamans.

556 Thus they drew into their hands coercive powers of no mean
756 [754] weight, for, as Henry Blow observed, "this [shamanistic] power
was used by the chiefs to get rid of rivals and there are some of
us old enough to remember of doctors being paid to kill certain
persons and of their foretellings of the exact day they would
die."[11]

K M The rise of the chiefs helped to knit together tribal loyalties.
175 A war party formerly consisted of only those among the able-
178 bodied men who were inclined to fighting, but a successful leader
622 increasingly transcended tribelet parochialism, drawing followers
619 from diverse hamlets and villages across the Klamath country.
628 As warfare became a way of life, the occasional allegiance ren-
726 dered while in the field became an enduring acknowledgment
of worth.

K In the growing eminence of the new leadership, hereditary
622 principles may have been operative. Chiloquin mentions his
175 father as having been a chief on Klamath Marsh, his own brother
as a subchief, and a sister as a chief. The father of Dave Hill,
a rising young war leader, was a village chief; while Allen David,
later head chief in reservation days, was the brother of Captain
George, a Klamath Lake chief. That family eminence was not
essential, however, is shown by the personal history of Lileks,
K [838] of good—but not chiefly—background. Lileks was a transvestite
in his youth until a supernatural experience vested him with the
power that was to lead him to be head chief of the Klamath.[12]

K A minor factor in these developments may have been the
195 interest of the whites in the centralization of tribal power, in
643 order that they might deal more effectively with responsible
648 leaders. In 1844, Elijah White, then Sub-agent for Indian affairs
● 177 met with some Klamath and Molala who had ridden into the

175
Kalapuya settlements in the vicinity of Oregon City, and induced 177
them to be regulated by the same rules as were the Nez Percés 643
and to appoint a single paramount chief. A disaffected Indian from 648
The Dalles, however, subsequently joined the party as it was making its way homeward and provoked a quarrel in which those favoring the Agent's proposal were slain.[13]

While these events were taking place, the Klamath country 175
was again being visited, at first by occasional parties whom the 648
Indians watched unseen. In the years 1844-45 a mixed party of Walla Walla, Spokane, and Cayuse, under the Walla Walla chief, Piupiumaksmaks, passed through the Klamath region en route to California to buy cattle. In 1843 and again in 1846 the Klamath were visited by the explorer, John C. Frémont. In his earlier visit, the martial captain, in order to quell "the treacherous disposition, which is a remarkable characteristic of the Indians south of the Columbia," fired a round from his howitzer over Klamath Marsh. Although his action was scarcely calculated to allay the suspicions of the Indians, he was shown the same courtesy as had been extended Peter Skene Ogden years before. A village chief—the father of David Hill—and his wife came out to meet the party and guided them east toward Summer Lake.

Frémont's second entrance, in 1846, was less fortunate. In that year, moving up from California, he passed through Modoc country and thereafter up the west shore of Upper Klamath Lake, where he was attacked by a party that had followed him from the southern end of the lake. Three of his Delaware Indians were slain. Although his attackers probably were from the Klamath Falls tribelet, Frémont's reprisal was directed instead at a village of the Lower Williamson group. Neither women nor children were spared in the attack. The slaughter left a legacy of hatred that did much to draw some of the Klamath into the Molala war.[14]

By the time of Frémont's second visit to the Kamath country, [731]
the Indians of Oregon had been sorely stricken. Diseases brought by the whites had ravaged the tribes of the Columbia and Willamette valleys. The Hudson's Bay Company had sought to assure a firm supply of furs in the country it controlled and thus to maintain just and amicable relations with the Indians; and many of its employees had taken Indian wives. It was now being

> told him about the Holy Spirit that was to come to the whole 175
> world and visit its remotest parts. When he came back from the 648
> Dalles he told his people about it but found them groping in [797]
> perfect darkness. . . . They would not believe him and told him he lied. He had watched long for the coming of the Holy Spirit and had never doubted that he should see him. He had heard Mr. Meacham talk for many days. . [and] now he saw that he was not like other men and knew that he must be the Holy Spirit come at last to bring gracious gifts for all tribes. . . ."[16]

Others—and they were to become more influential—lived for 175
some time with whites and became convinced that the best 177 •
policy for the Klamath was one of peace. They included Lileks, 648
who in the course of the trading excursions to the north dwelled 622
for several years at The Dalles and was exposed there, no doubt, to the examples of authority set by whites as well as by the Columbia River tribes themselves. Another was Dave Hill, who, starting about 1859, lived approximately five years in Oregon City. Allen David, later to succeed Lileks as head chief in reservation days, was "well versed in the ways of the white man, from travel among the Willamette settlement." Another was Charley Preston who, like Hill, had spent five years at Oregon City, working for white farmers and had become "quite civilized and learned many of the white man's ways. He returned to his tribe and became a headman. . . ."[17]

Men such as these became the leaders of a "peace party"
among the Klamath, and their views achieved dominance in the 175
growing centralization of power among the Klamath. Lileks may 159
have consolidated the ascendancy he presently achieved as head 622
of this group by marriages beyond his tribelet: to the four wives [595]
from his own, Klamath Marsh, division, he added one each from the Lower Williamson and Klamath Falls groups, as well as one
from the Modoc. From the Columbia he or a contemporary [177]
brought back new "laws," which included the institution of [681]
flogging as punishment for murder or for persistent quarreling. In one instance, ascribed by Spier, with some question, to pre-reservation days, when two men of the Lower Williamson River tribelet slew a Klamath Falls man, Lileks had them haled to Klamath Marsh, where each was beaten five times.[18]

When, in 1858, it was indicated that Klamath and Rogue 175
648

175 River renegades had slain five prospectors on a tributary of the
648 Rogue River, the whites apprehended three Klamath involved
in the affair, "whom the Klamaths voluntarily killed to prevent
trouble; that tribe being now desirous of standing well with the
K U.S. Government."[19] It is probable that the hand of Lileks is to
[622] be discerned in this matter also. In brief, his power and that of
Chiloquin, often termed his second chief, was challenged only
by Captain George, leader of a faction hostile to the whites, and
by Monchnkasgitk, leader of the remote Upland tribelet.

Thus the frontier condition brought a heightened rate of inter-
K
175 tribal warfare and of intertribal trading. It gave the Klamath
648 both peaceful and bellicose exposure to whites, largely outside
177 the Klamath homeland. In the awareness of new ways of life
[721] beyond the limited range of which their fathers had been con-
[439] scious the Klamath of the first half of the nineteenth century
became diversified in outlook. Enriched with new goods, Klamath
culture prospered, although in comparison with the levels
K achieved by the whites it seemed poorer than ever. Warfare had
M
721 consolidated power and wealth in the hands of leaders and the
648 magnitude of their operations drew Klamath and Modoc into an
175 uneasy cooperation.

622 Indeed, in many of these developments the Modoc participated
K only to a small degree. In disposing of those slaves destined to
M
175 be sold at The Dalles, the Klamath and occasionally the Warm
567 Springs peoples acted as middlemen; in consequence the Modoc
721 did not come as fully under the influence of the Columbia River
177 tribes, nor did they amass as much wealth. The development of
556 a chiefly class among them was feebler, and the tribelets co-
M
643 alesced under a single acknowledged leader only tardily and
525 incompletely.[20]

619 When in 1846 an exploring party under Jesse and Lindsay
M Applegate laid out an alternate emigrant route known as the
175 South Road, they directed it from Fort Hall down through Modoc
648 country and past the winter settlements on Tule and Lower
721 Klamath lakes, then west of the Cascades and north to the
Willamette settlements. The Modoc bitterly resented the in-
vasion of their homeland and waged war against the wagon
trains, a war which in turn brought reprisals from the settlers.
In 1852, after the Modoc had extensively damaged several trains

*648 the neighboring settlers were in part made up of men with
*657 Indian wives, and in part, too, of former employees of the
[464] Agency.[19] They were not always respectful of the dignity of the
Agent and frequently challenged his authority. At times, as in
the strife of the 1880's with the stockmen on the eastern border of
the reservation, the clashes assumed an almost warlike character.

• 177 Despite these preoccupations and deterrents, work somehow
433 proceeded. Not all Indians wanted the progress, with all its circumscriptions,
*657 that was gradually unfolded before them, and not
all who desired it were capable of achieving it. Nonetheless, the
lure of a farm and a herd of horses or cattle of one's own, to be
able to have a wagon and be a man of substance, to use the coffee,
sugar, salt, beef, flour, and baking-soda that had become the new
necessities, to dress well: these opportunities, open only to a few
entrepreneurs in the old days of raid-and-trade, now became
available to any who would work hard and subject himself to
177 an alien discipline. It was just this regimen that whole generations
*657 of children were subjected to in the schools. In the main,
871 the program in the early period was a success. The reasons why
its success was no more than qualified are set forth below.

*648 The tasks the government set itself were manifold. The Indians
*657 of independent tribes and bands were to be confined within a
177 reservation and there brought into a single polity. Within twenty
years they were to be transformed into self-sufficient farmers and
their feet set upon a road marked by the use of "citizens' dress,"
of modern homes, preferably situated on individual farms, by
ability to speak English and even to read and write in that medium,
and the abandonment of their own faith for Christianity.
Annual reports of the Commissioner of Indian Affairs carry a
statistical summary for all reservations of the state of "civilization"
of the Indians, couched in these and similar terms. Narrative
reports of the Agents dwell time and again upon the inculcation
of proper aspirations, extending at times even to the
minutiae of observance. "During the last two or three years,"
states Linus M. Nickerson (1884) with satisfaction, "I have not
[864] known a burial when the coffin has not been covered with a good
quality of black cloth or velvet and where the trimmings have
not been equally good."[20]

[Klamath Reservation]

FOUR

[P.52]

Clothing, Names, and Houses

*648 SOME OF THE OBJECTIVES SET FORTH BY GOVERNMENTAL POLICY
*657 called for programs of broad institutional transformation in
• 177 economy, political structure, and religion, and for only slightly less sweeping modifications in the family. Indian life was to assume the pattern of the rural, homesteading families of postbellum America. To judge by the wording of the treaty, a generation was deemed sufficient at least to launch the changes.[1] Meanwhile, the young were to be schooled to take up that new life—a life yet to be realized by their parents.

The dangers of increasing intergenerational frictions, of augmenting stresses between different segments of the tribesmen, were not directly faced. Among them, individuals responded to the opportunity according to their differing capacities and inclinations. Those who forged to the front in the early days of the reservation included a number of persons already familiar with life in the white settlements; and the Agency threw its weight behind them and cited their cumulative development as evidence of the wisdom of government policy. When so construed, however, their achievements created administrative expectations for their fellow tribesmen that proved unrealistic.

In enumerating the features that would be taken as indexes of progress in the statistical reports, the Bureau of Indian Affairs was doing no more than seeking common denominators of acculturation, readily observed and counted. At the same time, there was a temptation for local administrators to manipulate the
[291] markers and satisfy the indexes directly. Thus white clothing was
[342] issued directly as part of the annuities and houses were built for
[554] Indian leaders. To these practices, and toward such acts as the
[553] bestowal of new names, there was no organized opposition, and
acceptance was rapid.

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

acceptance was rapid. They will serve as a simple introduction to 648* 657*
the programs as a whole and to some of the underlying factors. 177

CLOTHING AND NAMES

An individual's acceptance of white clothing and names affected only himself. 177
Consequently, it waited less upon consensus 291
than did the assumption of a reservation political order, a change- 657*
over to farming, or even the decision to build a house in the new fashion. Moreover, both clothes and names, external manifestations of a new status, were supplementary to those already worn. Their addition to the stock already on hand did not at first require that native counterparts be discarded. The same eagerness shown toward Plains-type garments was now exhibited toward those new, prestigeful novelties: the blankets, trade cloth, and surplus military uniforms issued as part of the treaty annuities.

Although some of the first trade flannel was made into banners,[2] a monthly report of 1872 notes that it was being "cut into dresses for the old women and calico [is] purchased for lining."[3] A photograph of Dave Hill and Tecumseh, two Agency employees, taken in Washington in 1875,[4] shows them impeccably clad in the fashion of the day. It is unlikely that their garb could have been matched among the men on the reservation, yet the easy availability of men's clothing in the form of surplus uniforms gave men an advantage over their wives in the attainment of the new mode. For lack of suitable models, women's clothing lagged, but by 1877 the Agent could state, "The women try to imitate the fashion of dress, and many show a commendable neatness in their apparrel. They adorn themselves in many instances with native styles of ornament; but they generally couple with this cleanliness of person and dress; but all, both men and women, adopt and seem to prefer the American style of dress."[5]

Along with their easy acceptance of the new clothing, the 657*
Klamath also "readily" agreed to cut their hair.[6] This was a 177
significant step, for close-cropped hair was worn only by 602
mourners, and to wear the hair in this fashion at another time might bring on a bereavement. Here the example of the whites
may have provided encouragement for the step. Moreover, the 657*
whole sphere of funerary practices was undergoing change; some 177 764

*657 two years earlier, about 1868, Chief Lileks had induced his tribesmen
• 177 to abandon the practice of cremation in favor of the inhumation
764 he had observed in trips to Jacksonville, Yreka, and The
*657 Dalles.[7] With burial came new symbols of mourning and, apparently,
177 a partial relinquishment of the association with cropping
765 the hair. A few conservative individuals, however, still
302 resorted to the practice over a half century later.

[178] Naming the Indians was a matter of administrative necessity.
*657 Officials, faced with the duty of identifying their charges, labored
177 under the task of reducing unfamiliar sounds and lengthy, incomprehensible
551 names into writing. For the Klamath, the addition
553 of another name posed no problem. It had been native practice to use age terms for the very young—"My name is *niskag* (young girl)," one woman recalls telling her teacher—and to employ relationship terms when addressing kinsmen and occasional names in referring to others. The occasional names, of which an individual might have more than one, were often far from complimentary. Thus the literal meaning of the name of the Upland chief, Monchnkasgitk, is "One-who-has-a-big-belly;" while that of the individual later known as Allen David was "Black Anus."

Many new names were assigned when annuities were issued or when children entered school.

> It became one of the functions of the interpreter and clerk [recounts Good] to rename the stalwart braves, who were highly delighted with such commonplace appellations as "Joe Wilson" and "George Brown." "This is your name," he would say, writing it on a card, "and if you forget what it is, ask anyone who can read, and he will tell you." The bestower of names was sometimes amused at the corruptions arising from the Indians' peculiar pronunciation, as when "John Wesley" became "Whistler" and one who went forth as "Simeon" returned as "Sammy Andy."[8]

It may be added that the soldiers at the Fort and the settlers were also responsible for such names as "Great Eastern," "Old Faithful," "Skinflint," and "Skedaddle."[9]

*657

Housing

177 A relatively greater effort was needed to induce the Indians
342 to abandon what Agent L. S. Dyar characterized as "their warm,

ill-ventilated, native houses,"[10] in favor of log and frame dwell- 657*
ings. The advantages of the new structures were not evident to 177 •
the Indians,[11] and the labor required to build them was consider- 342
able. A small sawmill was set up in 1870, but at first its output 657*
was diverted primarily to Agency buildings. Somehow, the lum- 177
ber even after that time did not seem to go for housing. 313

> The completion of a sawmill [declares the roseate prose of A. B. Meacham, superintendent of Indian affairs for Oregon] has worked a great reformation, inspiring them to extraordinary exertion to amass property of various kinds. . . . They have donned the white man's costume, taken the ax, cross-cut saw, and hauled to the mill a half-million feet of timber, and today are lumber merchants with stock in trade constantly on hand, evincing shrewdness and business integrity that makes an agent's heart strong to work with and for them."[12]

The following year, 1872, Agent L. S. Dyar was at length able 657*
to report that "four good frame houses have been built for the 177
Indians, and two more [are] well under way."[13] They were built 342
for the leading men: for Chiloquin, Francis, Hunter Wilson,
Henry Blow, "Sergeant" Morgan, the daughter of Lileks, and
Link River Jack. On the Upper End, the commissary in charge
of the subagency urged, "During the ensuing two or three months
the houses promised Chiefs Barcley, Ben and Chocktoosh a year
ago should be built. . . ."[14] These houses were small, one-room [352]
frame structures, vulnerable to the winter cold, but furnished
with a bed, table, and four chairs.

Among the Indian advocates of the new dwellings were such men as Dave Hill and later Jesse Kirk, who, as elderly Indians today recall, used to ride around among their people counseling, "You've got to quit the old ways, change your houses, live like white people." They met opposition. Chief Lilu declined to leave his earth lodge for the house the government had built for him. As late as 1891, Agent D. W. Matthews noted that there was still "an occasional wik-e-up, which some of the aged prefer."[15]

> An Agent [recounted an elderly Indian of this time] used to go around from place to place and told the Indians that they must make homes for themselves of rough lumber, and get away from the wikiup. I heard him tell my father. My father said, "All right, if I can get the lumber." An old carpenter helped my father make the rough house. He must have been educated be-

> beds or other furniture. We had cracks all around. I was glad
> [592] and rolled around on the mats. We didn't have two families in
> this home like in the wikiup. Just my family."[16]

As families began to cultivate individual farms, to fence their land, and to erect barns and other outbuildings, some homes began to approach in quality those of the white farmers in the surrounding region. And, as they did, the Indian houses came to reflect a widening span between persons in standard of living.

Economy

AGRICULTURE

657*
IT WAS FUNDAMENTAL TO OTHER PARTS OF THE PROGRAM OF 648*
planned change that the Indians cease to depend upon fishing, 433
gathering, and hunting, and that they turn instead to farming. In this way and only in this way, the administration believed, could they be tied to the land within reach of Agency influence. The experience would teach them the virtues of industry, and they would become self-supporting. At first, it was acknowledged, they would have to eke out the produce of their farms with the yield of the native food quest and the rations that formed part of the treaty annuities. In time, the success of farming would render unnecessary those supplements.

With this plan before them, the early Agents fell to with a 657*
will. In 1866, when Lindsay Applegate established the Agency, 177 •
241

> . . .the little party. . .did not waste much time in beginning operations in their settlement. Two cabins were built, fields fenced, and a large vegetable garden planted, in all of which the Indians assisted to the extent of their ability, without compensation and evidently in a holiday spirit. A field of about thirty acres of bald barley, wheat, and oats was enclosed by a temporary fence in a day or two. The operation of the breaking plow was watched with great interest, and Chief Mosenkoskit of the Sprague River band insisted upon handling it himself. Unaccustomed to this kind of exercise, it was all the powerful sachem could do to maintain his balance as the oxen dragged the swaying plow through the heavy sod, but he was thrilled with a vision of the power of the plow and all it might mean to his people, and expressed himself as eager for the time when such work might go forward in his own beautiful Sprague River country. The Chief's enthusiasm for the plow is typical of the attitude of the whole tribe, toward the white man's civilization. It may perhaps be truthfully said that this enthusiasm too often expressed itself in

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

> *657 a mere change of externals, yet the white man's ways as the red
> • 177 man understood them were adopted with a rapidity unequalled
> 241 in most Indian tribes. . . .
>
> The vegetables grown that first year [corn, beans, turnips, carrots, peas, potatoes, artichokes, and onions][1] were a revelation and a delight to the Indians, who had previously lived so largely on small native roots. I have heard my father say that they were particularly captivated by beets which, with their red juice, they thought resembled "ittle-willy" [meat].[2]

In the effort to induce the Indians to cultivate their fields, the Agent seems to have enlisted the aid of the military. "I had about one-half acre broken for Blow," wrote Captain F. B. Sprague, "and he is at work like a white man, has it all fenced and cetera, & plants growing finally."[3]

The crops the first year were reported good, but subsequently
[133] they were killed by frosts or summer droughts. The elevation
[132] of the Klamath Plateau, some four thousand feet above sea level,
limits farming even today. Reports are studded with the phrases, "heavy frosts," "unprecedented heat," "unusually dry and frosty." Surveying the blighted fields, the early Agents redoubled their efforts. In 1869, Applegate reported that "the teachers . . . have been for a greater part of the time engaged on the farms, along with Indian boys receiving instruction in manual labor. . . ." R. B. Hatton, schoolteacher, stiffly pointed out that he "was instructed to labor on the farms . . ." and the tenor of his remarks suggests that in so doing he had been diverted from what he considered his proper function.[4]

*657 The following year, the new Agent, Captain O. C. Knapp,
*648 stated, "I again urge upon the Department the uselessness of
177 trying to make this an agricultural reservation. . . . The Indians
231 should be supplied with cattle and sheep, and they would soon
241 become self-sustaining."[5] His words were echoed by Agent L. S.
Dyar, in 1872: "These [crop] failures are very discouraging to the Indians as well as to the Agent, and demonstrate the necessity of paying more attention to the raising of cattle. . . ."[6]

*657 Nonetheless, from 1871 on, with the aid of the farmer, several
177 Indians cultivated little farms along the Williamson River and
241 the lake shore.[7] These in the following year amounted to some
twelve to fifteen individuals who "have small patches of land of a few acres each fenced, on which they have, with the help of

the employes, usually raised a little grain and a few vegetables."[8] 657*
Dyar viewed their efforts as praiseworthy, but unlikely of success. 177 •
"Although there is but little probability that the seed planted will 241
yield an abundant harvest," he observed, "yet I think it is better to gratify and encourage them by helping them all I can in their efforts at Agriculture as in doing so they are acquiring habits of industry and at the same time are preparing themselves to take care of the cattle which they now have and which I hope to see rapidly increase."[9]

Although Dyar continued to do everything in his power to 657*
advance stock raising, even converting the proceeds from the 648*
sale of hides into cattle for distribution to the Indians,[10] he still 241
lamented the impracticability of farming. "Were this a good 231
agricultural country," he remarked, "they would soon become 177
self-supporting and could they be induced to go to the Indian Territory it would be far better for them. As it is they must rely on stock and their old native food for subsistence."[11]

The hope for farming bloomed perennially. J. H. Roork, who 657*
succeeded Dyar, spoke of his ambition "to be successful in introducing 648*
such grains [and hardy fruits] here as will yield a reasonable 241
compensation to labor."[12] Soon thereafter, his superiors 177
were sagely advising him, "Your account of the failure of your efforts to raise field or garden crops . . . suggests the expediency of turning your attention to stock raising. . . ."[13]

When Roork had admitted defeat in 1878, and Agent Linus Nickerson in 1885, the new administrator, Joseph Emery, a professor from the State Agricultural College, sallied into the fray. With a determination that scoffed at the experiences of his predecessors he announced,

> I have not been able to depress the mountains nor lower our altitude above the sea, yet I believe, from experiments made the present year in a number of localities, that agriculture can be made a comparative success on the Klamath Agency. For years the Indians had received no encouragement to till the soil, and the great scarcity of implements on the agency made it impossible to accomplish much this year in the way of agriculture.[14]

Wistfully he remarked,

> If I had the plows to loan, I could set more than 100 Indians to work this spring tilling the soil. . . .[15] Fifty or more Indians have procured a little grain, and these will sow this spring from 1 to

> *657 10 acres of land. I am commanded, to go among the Indians
> *648 with my farmer and direct them in plowing, sowing, planting,
> 241 etc, and see that they have the necessary tools and know how to
> • 177 use them.

Vegetables, he thought, could be sold at Fort Klamath and Linkville; grain would always find a market at some price.[16] In order to heighten the incentives, Emery reported,

> I have found it necessary. . .to make temporary divisions of lands suited to Agriculture.
>
> During the Spring and Summer months, I laid off, assisted by Indian boys, about 50 farms, chaining boundary lines; the Indians greatly desired the work to be continued, each Indian agreed to fence and cultivate a portion of the land assigned to him.
>
> The plots laid off ranging from 30 to 120 acres—according to treaty stipulations."[17]

[625] The next year, however, he had recourse to the Indian police. "During the present Spring," he reported, "they have assisted in enforcing the general order that all able-bodied Indians will be required to do some work in Agriculture. I owe much to the police for the marked advance made this year in the lines of agriculture."[18] By these methods he soon had three quarters of the available adults helping, nearly every family seeding from 2 to 20 acres.[19] The following year he reported that "nine tenths of the Indians have been induced to engage in the work of agriculture,"[20] but the year after, with a record 2,400 acres sown, he was complaining about the "unprecedented heat"—and was moving on to greener pastures.[21] When he returned for another tour in 1896-97, however, he resumed the same program.

[829] Lindsay Applegate had remarked, some thirty years earlier, that the Indians "look upon the whites as superior beings. . . ."[22] It must have been difficult, even with the best will, to maintain that estimate in the face of administrative obstinacy of this order.

STOCK RAISING

*657
231
177 Meanwhile, with the discovery that the upper valley of the Sprague provided satisfactory condition for winter range, stock raising had gradually come to the fore. In prereservation days, horses had constituted an important form of wealth, and cattle were now accepted into the pecuniary system. By 1879, Agent

Linus Nickerson, who had formerly been superintendent of 657*
farming, reported some two thousand head of cattle upon the 231
reservation. Including the Agency herd, the average was some- 177 •
thing less than two head of cattle per tribal member. He added, "Some of the Indians are already raising beef cattle for the market. With the income they are able to supply their families with flour, sugar, coffee, etc." He claimed ten times that number could be carried by the reservation, a total that could be attained in five years, after which the tribe would become entirely self-supporting.[23] A severe winterkill next year, which destroyed seventy-five per cent of the cattle and forty per cent of the horses staggered his hopes.[24]

Despite such checks, however, the stock-raising program slowly recovered. With issues of yearlings (300 head in 1881)[25] and with natural increase, the herds grew. As they did, the farming program turned increasingly toward producing the hay needed for winter feed. Even blighted grain could be salvaged as hay. By 1883, Nickerson could report, "several large ranches,"[26]
and that year instituted the practice of buying Agency beef [439]
from the Indians. Buyers from San Francisco were at Yainax, he reported, and were offering $40.00 a head for the fifty fine animals on sale there.[27] Under the impetus of this demand, Nickerson reported, "a considerable number of enterprising Indian families are moving to [Yainax] and taking up fencing stock ranches. In two or three years, about one half of the population on the reservation will have settled there."[28]

By 1886, Agent Emery reported 1,485 head of cattle, 3,640 head of horses, 340 "half-breeds" (mules) and 195 hogs. The value set by the Indians on horses, together with a higher survival rate, led to an increase in ponies which was economically undesirable and Emery counseled the Indians to sell their ponies and buy cattle.[29] The quality of stock was a recurrent concern, and later Agents took steps to improve the breeds.

Logging

From the first, the Klamath demonstrated an eagerness to 657*
turn new opportunities to advantage, coupled with an indepen- 177
dence that sometimes strained administrative patience. When 313
the sawmill was completed in 1870, they promptly began to haul

*657 sawlogs in wagons issued to the head chief for this purpose.[30]
• 177 The lumber was earmarked for constructing Indian dwellings,
313 with twenty per cent (at least in later times) set aside as a milling
fee. In 1871, the Agent, requiring lumber to complete the grist mill, proposed to buy sawlogs from the Indians, the money to be invested in livestock, to be their individual property but to be kept in the Agency herd. "Probably one half of the logs," he added, "belong to the chief and I want him to lead off in buying stock instead of spending thier [sic] money."[31]

*657 By 1873, Dyar reported the Klamath were selling lumber to
177 Fort Klamath and other parties.[32] This trade soon became lucra-
313 tive, and when the elimination of employee subsistence allowance
439 threatened to bring on the miller's resignation, the Indians de-
cided to pay him the extra amount themselves.[33]

*657 Two years later, however, the Commissioner called Dyar's
*648 attention to a Supreme Court ruling of 1873, which held that
177 timber, like the land it grew upon, remained in trust status. Trees
cut incidental to the clearing of the land might be sold; but if
313 cut for sale the timber became the property of the United
439 States.[34] From time to time, Agents encountered this ruling anew.
Thus E. M. Marble, Acting Commissioner, pointed out in 1881 that, while Indians might hire out to cut timber, they had no property claim in the reservation stands.[35] The Indians then proposed to cut and sell dead and fallen timber, which was permitted. However, they also felled green timber and then requested permission to raft it down and sell it at a sawmill near Linkville.[36] Under the double guise of felling sawlogs for housing and cutting dead and fallen timber, a considerable illicit traffic went on with outside parties. Indians would resort to such devices as buying supplies from whites who wanted lumber and then proposing to pay the bill with lumber. The whites involved included one who had been carpenter at the Agency, but all stoutly avowed they did not know it was contrary to law. The Indians engaged in the venture numbered some of the most enterprising men, including at least three chiefs.[37] With the rise of towns around the reservation, the demand grew until in 1896 the sale of lumber to whites was estimated to exceed a quarter-million board feet, three-fourths of it cut from green timber.[38]

For the Klamath, their operations in the timber market were

657*

more than an exercise in resourcefulness and industry: they 698*
provided experience and allies in evading what must have 177 •
seemed a senseless legal prohibition. 313
439

EMPLOYMENT

Other employment supplied the Indians with cash to purchase 657*
items for which they were acquiring a taste. At the Agency, 177
Lindsay Applegate took the lead by hiring laborers for rations 464
of shorts (flour),[39] and from that time on Indians filled a variety 465
of subordinate offices, on the farm and roads, as interpreters, police, artisans and, later, in the schools.

Early in the history of the reservation, they began to work off the reservation for outside parties, John Meacham, following the directions of his brother, the superintendent of Indian affairs for Oregon, stipulated that the Klamath were to work four days on the reservation roads before expecting a pass to leave the reservation.[40] By 1877, Dyar was reporting that "the Indians make rails, chop wood off the reservation for citizens, some thirty or forty having been thus engaged."[41] They were soon drawn into haying and other harvest activities.

Among those who befriended them was "Sikes Worden, Post Trader at the Post, who kindly refuses to employ any but Indians for work which they can do. He will thus reimburse the Indian wood choppers, hay makers, etc. from a thousand to twelve hundred dollars per year."[42] According to figures given elsewhere, a woodcutter might receive $45.00 to $60.00 for thirty to forty cords of wood, while summer haying and harvest work might bring between $50.00 and $200.00 apiece.[43] By 1888, fully one hundred Indians were working as summer farmhands.[44]

FREIGHTING

Freighting was another major enterprise for the Indians. When 657*
Huntington had brought the first annuity goods down from The 177
Dalles in the fall of 1867, young O. C. Applegate had led his 489
"ax and rifle company," whose number included seven chiefs,
to meet it.[45] Several years later, when they had accumulated [439]
money from odd work, the Klamath made their way down to
Jacksonville and Ashland, some one hundred miles distant, and
bought flour at a little over one-third the price it would cost at

*657 the Agency, packing it home on ponies. Some brought back as
177 much as two thousand to three thousand pounds.[46]

489 This feat convinced Dyar of the practicability of hiring the In-
[439] dians to pack the annuity wheat from the Rogue River Valley for grinding into flour at the Agency grist mill.[47] In 1875, accompanied by two employees, they transported 100,000 pounds of flour from Ashland at a considerable saving "beside the experience acquired . . . and the confidence given them in their ability to accomplish what they undertake.[48] Under Dyar's urging and their own needs they requested that their annuities be changed from the " 'little things' (tenas ictas) as they term the blankets, clothing, etc. which they have heretofore recd." to mules and cattle. "The mule," observed Dyar, "is particularly adapted to the ways and use of the Indians in their efforts at farming, teaming, etc. . . ."[49] Two years later, encouraged by such instances, the Bureau instituted the general policy of employing Indians to haul Agency supplies.[50]

By 1881, the autumn trip to buy supplies in the Rogue River Valley drew the heads of some one hundred fifty families with an average of forty dollars each to spend.[51] In his report for the following year, Nickerson quoted a notice from the *Ashland Tidings* of October 27, 1882:

> *Indian traders*—About forty wagons, almost every one drawn by four horses, were brought to town by Indians from the Klamath Reservation after flour and other provisions last Tuesday. They filled the streets completely, and made a lively scene, until they moved on to their camping ground near the Eagle Mills. Nearly all the Indians had good harness and wagons, and dressed well. They are improving every year.[52]

With the acquisition of wagons and harness, the Indians began to take freighting jobs for the military at Fort Klamath and private parties at the growing town of Linkville. Twenty teams
[434] freighting during the month of August, 1889, earned approxi-
mately fifty dollars apiece.[53] The total income from this source five years before had been $5,500.[54]

*657
OTHER VENTURES

177 Indians now set their hands to other, lesser pursuits. In 1873,
434 Dyar reported that "A few with no help but instructions from
499
494

employees built a substantial bridge about 100 yards in length 657*
across the Williamson River, on which they propose to collect 177 •
toll. This will support several families."[55] Nothing more is heard 434
of the venture and subsequent work on bridges and roads took on [499]
a public character. A few women occasionally sold baskets and [494]
berries, and older Indians, generally women, were sometimes [462]
issued cinch rings and wove cinches as a means of support.[56]

Fur trapping provided an early source of income for some 657*
men.[57] At first, beaver, marten, and otter were especially sought, 177
and the available catch soon became depleted. By 1882, the 434
Klamath were turning to panther, bear, wolf, and coyote, preda- 224
tors which Nickerson claimed discouraged them from raising sheep. "The Indians," he reported, "now hunt them for their fur and receive quite an income from hunting and killing them."[58] Carried on over the late fall and winter months, the fur trade realized a total of $300.00 for those who followed it.[59] By 1891, however, the revenue from trapping was on the decline.[60]

Native Foods

In the original designs of the government, farming and other 657*
"civilized" enterprises were supposed to supplant such ab- 648*
original pursuits as fishing, hunting, and gathering. From the 433
Agent's viewpoint, the retention of native subsistence methods presented two major disadvantages. Not only did the traditional occupations coincide in season with farming, but they drew the Indians from under the direct surveillance of the Agency, and even off the reservation. The issuance of rations, though designed to provide a substitute during the transitional period, was restricted as much as possible, in order to allow more funds for other purposes.

It is clear from the graphic descriptions of the early Agents 657*
that they were well aware of the Indians' strong reliance upon 648*
native foods. The fish in Lost River, observed Dyar, ran from 433
two to four weeks earlier than in the streams within the reserve. 226
By late winter even the supplies of rations had been exhausted, and the Klamath eagerly awaited the news from the south. "If the Indians are not allowed to go to Lost River in the Spring," O. C. Applegate had pointed out, "then they will have to be subsisted during the month of March."[61] The Lost River fishery 657*
178
226

*657 continued to be exploited for fifty years, until the owners of the
• 177 abutting land put an end to it. On the reservation, the Sprague
226 and Williamson continue to supply a catch, although the drying
[251] of fish for the winter, common enough on the Lower End until
about thirty years ago, has now passed into disuse.

*657 Similarly root gathering continued to be an important activity
178 for many years, leading Nickerson to suggest that several of the
177 palatable and nourishing roots used by the Indians for food
222 "could be materially improved by continued cultivation."[62] "Root
[412] probes," or "camas diggers," as well as "fish spears" and fish
[227] hooks were forged by Agency blacksmiths for years.[63]

*657 Wokas long remained a staple for the Klamath. In 1881 Nicker-
178 son, noting that each family gathered some five to fifteen bushels,
added "this wokus, with dried fish, forms a large portion of the
222 food of those who have not the money with which to purchase
262 flour and groceries."[64] About the turn of the century, Coville observed a thriving wokas-gathering industry with a vast expanse of marsh to exploit, and speculated on the possibility of processing the seed commercially as a breakfast food.[65] The decline of wokas gathering parallels in time the Indian's diminishing use of dried fish, another winter food.

*657 A similar course can be traced for those fall activities, hunting
177 and berrying. From at least 1872, Indians were reported leaving
178 the reservation in September to hunt and gather berries in the
222 Cascades.[66] In addition, the men on occasion went on a spring
224 hunt for antelope and mule deer at the north end of the reservation.[67] Gradually the fall berrying and hunting came to be concentrated at the "huckleberry patch" on Huckleberry Mountain, southwest of Crater Lake. Hunting has continued to be both a sport and a means of providing food; and if the preparation of jerky has declined, it is because the freezer has displaced it.
[251] The drying of berries and wild fruits has been rendered obsolete by canning. There is local testimony that the killing off of predators by fur hunters and stock raisers has caused an increase of deer upon the reservation itself. It is not infrequent for a single family to consume six to fifteen or more deer in the course of a year. One tribal leader from the Upper End, a man then less than forty years of age, remarked in 1958 that until his family

657*

moved to Klamath Falls when he was nine years old, he had 177 •
eaten only venison and had never tasted beef. 178
222

In their continued loyalty to traditional foods, the Klamath 224
were responsive to several advantages beyond—but including— 657*
appeal to the palate. The techniques involved in securing them 178
were relatively simple and familiar, imposing few demands upon 177
the individual for capital investment in tools and labor, required 262
little in regularity of routine, and involved the cooperation of only small groups. Participation was direct, self-controlled, and provided an immediate reward.

Consequently, the issues of beef and flour were assimilated in use to native staple foods, rather than replacing them entirely. Flour was given the name that also denoted a meal made from ground seeds and cattail roots. It must be borne in mind that the rations were issued at times when other foods were largely exhausted, and probably because of this certain anomalies were introduced. Since the issues were public and general, there was no need, as there had been formerly, to conceal foodstuffs from neighbors. Thus, bread and biscuits were the first foods to be baked in the coals of the house fire, rather than in a special outside cooking hut; and, perhaps because of the method of issue, the food was shared by household, rather than by an individual family.[68] The practice of eating while the food lasted strained Agency resources: the Commissary at Yainax estimated that an Indian could easily dispose daily of two pounds each of beef and flour.[69]

The example provided by white cooking, the use of salt, sugar, 657*
and baking soda, as well as new foodstuffs, together with the 177
general acquisition of such utensils as the kettle, coffeepot, and 178
spider, extended the variety of culinary techniques and even 262
enhanced the preparation of native dishes. One woman recalls 263
the ease with which one could hull wokas with a coffee grinder; 415
and when a kinsman borrowed that useful instrument, she used her wokas mulling stones to grind coffee beans. Through it all, native foods continued to be favored, and the observation that "the Indian [school] children are very fond of fish" is nearly as true today as it was in 1893.[70] 657*

An analysis of the statistical and narrative reports of the 177
178
262

*657 •177 178 262

Agents shows that they consistently tended to undervalue the contribution made by native foods to the Klamath economy. From the first statistical entry in 1882, when they are estimated to contribute forty per cent of the food supply, native foods steadily decline in the records, leveling off from 1888 to 1893 at approximately twenty per cent, and, after a spirited fluctuation from then to 1901, rising slowly to ten per cent in 1904. That dependency upon these foods declined from total to partial reliance is admissible. O. C. Applegate, while Superintendent, reported that by the turn of the century some of the food resources had begun to dwindle under intensive use. He found the fish less abundant than in the halcyon days of the first Agent, and observed that both water fowl and prairie chickens had been overhunted.[71]

While conceding the decline, a critic may well find fault with the bland assessment of Elisha Applegate a decade earlier (1891) that native food quests were then "indulged in more as incidents and to add variety of life than as occupations to be seriously depended upon."[72] The year after Applegate made his report, one graduate of the Indian school, upon returning home, saw things in a different light. "Whenever I got job, I pitched hay. I did fishing and hunting, and I had plenty to eat all the time . . . lots of deer meat, and I used to pick wokas too."[73] If this was an indulgence, it was in sheer survival.

The sources of error are not hard to find. Administrators could form only the most general opinion of the contributions made by native foods, and must have tended to judge from the examples provided by Indian employees immediately at hand and from the more acculturated Indians. Moreover, their reports were in part designed to illustrate the progress which their charges had made away from their former customs. Accordingly, they understated the degree to which native economic activities conditioned the acceptance of new modes of earning a livelihood and supplemented those which had been taken up.

*657 177 178 221 433 [313] [464] [489]

Consider, by way of example, the pursuits which in the 1880's could be combined according to taste, need, and season.

Lumbering and logging were winter and spring enterprises, with intermittent logging taking place in the fall. Labor for the contractor at the Fort and for settlers ran from spring through

657*

fall; while freighting, limited by road conditions, had the same range of seasons. 177 178 221

For the farmer, splitting rails and fencing started in the winter and ranged toward spring, as did the clearing of ground. Plowing and sowing of grain might start in March, while vegetable gardens were not planted before May or June. Harvesting and haying took place in late summer and threshing in the fall. 433 [464] [489] [241]

The stockman rounded up and branded his cattle at first in the fall and later in the spring. He sold his beef in the fall, then drove his herd to winter in the upper valley of the Sprague. [231]

Those who relied upon aboriginal foods fished in the late winter and early spring, dug roots or hunted antelope and mule deer in late spring, gathered wokas, wild fruits and berries in the fall, hunted in the Cascades in the fall, and trapped for furs in the winter.

657* 221

Beyond this lay the domestic cycle. Homes were built or repaired in the spring and fall, supplies were bought in the fall, and fuel was gathered in the fall and winter. 342 356 313

This summary, bald as it is, will illustrate the fact that many more ventures were now open to the enterprising, as well as a wider range of relationships. It was possible to draw from several cycles activities that were seasonally compatible. Thus, when the harvests were in, fully one-half to two-thirds of the men might leave the reservation on passes to work for whites, taking their families with them.[74] Frequent crop failures drove many to seek outside employment to provide for the coming winter. Because new tastes had given rise to new needs, many at this time forsook those traditional pursuits that conflicted with more lucrative employment. Nor did money alone lie at the root of those preferences. Work for white settlers and freighting provided variety and seasonal mobility, opportunities to meet people, to change scenery, and to escape on occasion beyond the rule (however benevolent in intent) of the Agent. 657* 433 464 177 178

The new opportunities were open primarily to men, consonant with the roles of the sexes in nineteenth-century rural America. For them the new system, aside from a certain administrative favoritism, provided an equal chance for advancement. It is no accident that a number of the earliest employees of the Agency were Pit River Indians, of whom it was later said: ". . . as a 657* 433 177 178 [567]

*657 433 •177 178 567 general thing, they are quite prosperous, and energetic, having learned how to work well as slaves for the Klamaths."[75] One of them, the Indian named Skedaddle, formerly the slave of Chief Lilu, was first employed as farm laborer by the Agency.[76] During the Modoc War he enlisted under the name Henry Jackson. In 1883, he reappears as an interpreter at Yainax, in which office he cut hay and cared for the Agency herd as well as butchering the beef cattle.[77] Subsequently, he contracted with white ranchers to split rails, taking half his pay in cash, half in cattle, eventually amassing a sizable herd, which multiplied until it amounted to some eight hundred head of cattle and five hundred head of horses and mules.[78]

ANNUITIES

*657 *648 It was Agency policy to develop the quality of industry and to ensure the growth of individual enterprise. From this standpoint, the annuity system, in providing rations, was a device to surmount agricultural failures, to carry the Indians through the winter, and to keep them settled quietly upon the reservation. At the same time, there was a danger, of which the Agents were soon aware, that such issues would sap the self-reliance of their charges. As early as 1865 when Lindsay Applegate took over their supervision, he found that, though the Klamath and Yahuskin were well enough supplied with native foods to sustain them through the winter, it was necessary to quiet "their loud clamorings for flour." Accordingly he "made some moderate issues to the chiefs and, through them, to some of their subjects who seemed rather needy." The issue, it would seem, was sought as a right and as an exemplification of the good faith of the government, for he adds, "I became convinced at this time of a growing disaffection among the Indians, on account of the tardiness of the government in fulfilling treaty stipulations."[79]

Discontent was compounded by the suspicion, possibly inspired by unofficial advisors among the whites, that inferior goods were being palmed off in the annuities.

> I was approached today [recounted Captain Sprague to Applegate in 1867] by a Sub-Chief who requested me in the name of all Sub Chiefs to be present at the distribution, and in case the goods distributed were not of good quality and deficient in quantity to note the fact and represent to the authorities at

ferred.[90] At another time, he seems to have proposed issuing seven mowing machines and four sulky rakes to leading and competent Indians, but was firmly instructed by the Commissioner, "as these articles are intended for the use of all, it is not considered advisable to allow individuals to have the entire control of them." He was instructed instead to loan them out.[91] 657* 648*

"As these Indians become more civilized," observed Nickerson, "their demands upon the mechanics become more frequent and pressing."[92] Indeed, he had to advise the Commissioner against the policy of issuing condemned articles to the Indians since "they will bring them to the shops and demand that they be repaired."[93] It is plain that the frequent call, as a matter of due right, upon the services of Agency personnel lay at the bottom of Nickerson's desire to decentralize equipment by issue through the chiefs. To counter these demands, he had Indians trained to operate the mowing machines, sulky rakes, and other agricultural equipment. When Indian farmers desired to use a machine, the operator was to be paid for his labor and the use of his team. Nickerson added, "I have notified those Indians who are able to do so that next year they will be required to purchase their own machinery for haying purposes. Some of them are already laying aside money for that purpose."[94] Emery instituted a similar program whereby individuals paid an Indian workman for repairs made in the shop on their wagons.[95]

The ownership of a wagon required considerable outlay, more than some persons could muster. Hence, as Emery noted, wagons, plows, and other implements, as well as cattle and horses, often were held in common by two or three Indians.[96] [422]

With their introduction to an economy in which money served as a mediator in relationships there are indications that the Indians began to develop the view that all positions advocated by the Agency must carry remuneration. Nickerson, reviewing possible candidates for Indian judge, found himself obliged to state, "Those persons with most financial ability are least disposed to serve without compensation and generally least well qualified for such service."[97] New forms of wealth had come in, new desires, new needs, and native society was transformed in the effort to attain them. [177] [178] [434]

*657 *648 622 time had come, he summoned his people "to receive his solemn admonishments err [sic] his spirit take flight." Soon recovering, he voiced to the Agency farmer, S. D. Whitemore, the suspicion that the shaman who had cured him, and whose professional charges had stripped him of all his effects, had been in league with the subchiefs to bring about his death; and he requested that the shaman be imprisoned by the military. Later events made it clear that Monchnkasgitk had been a leader in the conspiracy, plotting to take the place of the old chief. Thereupon, Whitemore, then in charge of the Agency, called a council, at which he "stated that it will be highly necessary to consult their, and the government agent, or the change could not be regonized [sic]. . . . I learned that after a lengthy consultation with the indians has [sic] become impressed with the belief that Mosen Kasket and his band have no hostile intentions."[7]

[558] With Agency backing, Lileks once more was restored to a position of relative authority, but his recourse to outside support caused his personal prestige to decline. He thus had to resort increasingly to formal instruments to bolster his power and to implement the changes he sought. When one Spokane Ike slew
[682] his child in Jacksonville, Lileks asked that the Agent order all Indians back upon the reservation. Spokane Ike was tried by the Indian court, Lileks presiding, and was fined fifty dollars.

[692] Lileks took readily to the court, and Whitemore reported, "The indians are holding court dayly [sic]. I am not informed of the nature of their cases." O. C. Applegate described one session thus: "A few days ago the Grand Court of Klamath set, Chief LaLakes presiding, and many men were convicted of many
[681] crimes. One in particular had stolen a number of women, 20 mink skins and otherwise trampeled [sic] on the rights of his people, he now wears shackles and a heavy log chain and chops wood for La Lakes."[8]

*648 *657 622 The head chief was by no means an advocate of indiscriminate change. He favored inhumation of the dead, which he had witnessed among the whites in his travels to Jacksonville, Yreka,
•177 and The Dalles, over the native practice of cremation; and about
[764] 1868 he secured its adoption.[9] On the other hand, when the
[567] proposal was made in 1865 to liberate the slaves, Lileks was prominent in voicing his displeasure, undoubtedly backed by

other chiefs who were the principal slaveholders. "The Indians," 648*
reported Lindsay Applegate, "have declared that if such was to 657*
be the case, they would kill all of the Pitt River Indians among 622
them or run them off to other places to trade for horses."[10] Per- 177•
haps in deference to that feeling, the slaves were not liberated 567
until 1869, after Lileks had been deposed.

Within the reservation polity, the ailing and senile Lileks 657*
proved increasingly difficult to control. Growing autocratic 648*
toward his followers, he stubbornly opposed Agency policy. 622
Meanwhile, Monchnkasgitk, sensing his weakness, was waxing troublesome in a new bid for power. Early in 1868, Whitemore reported that the Klamath were venting a "more turbulent spirit one with another," and that they were flourishing arms and axes upon one another. Lileks now openly admitted that he could no longer control them.[11]

Meanwhile, the administration had progressively lost confidence in the turbulent chiefs and came instead to rely upon younger men such as Allen David, Henry Blow, Dave Hill, and Charley Preston, who combined a warlike record sufficient to give them standing in Klamath eyes with a dependable advocacy of white ways. These were men with whom young Oliver Applegate found strong mutual ties. When Lileks lost sway over the Klamath, it seemed natural to Applegate to move while he was temporarily in charge of the Agency to depose him.

The manner in which he did so is illustrative of the direct intervention by which the adminstration subsequently shaped political affairs. Applegate's own notation is sufficiently succinct.

> A few days ago [he wrote his brother in the spring of 1869] I had a great Council with the indians and tried some chiefs for various offences. Two of them (La Lakes & Moshenkosket) finding themselves about to be impeached, resigned. A grand Convention was held and candidates nominated for President. The campaign is now fairly open with Allen David & Blow in nomination.[12]

The matter as he later recalled it in greater detail was something more than the convention he deemed it:

> The younger Captain Applegate [narrated his daughter] took charge of the affair and called a meeting of the Indians at Kowasta in the early summer of 1868 [sic]. Here, seated on the

> *657 A large number of Indian offences come before this Court for
> *648 trial, consisting mainly of family quarrels, disputes about the
> 692 ownership of property and acts of licentiousness.[68]

With the accidental death of Crain, Jesse Kirk was appointed in his stead.[69]

Thus, within a generation the administration had replaced the popular leaders with those among them who were Agency employees, and in turn had supplanted them with the products of its schools. Legally constituted authority was administered through the Agency, at first through a customary court of chiefs and later
[625] through a Court of Indian Offenses. The Indian police, who took
their orders directly from the Agent, were satisfactory to him as the instrument of his hand. Not so the courts, which tended instead to constitute seats of power alternative to that of the Agent. The result was to be that Agents tended to strengthen the police while circumscribing the functions of the courts.

*657 Meanwhile, beyond the administrative structure thrived an
*648 unacknowledged informal leadership, based as in former days
622 upon wealth and accomplishment. Unlike that of the Agency, it
571 was not restricted in position nor limited narrowly in function.
This was a leadership in which employees could also participate; and it was presently to see such diverse men as the old chiefs, Monchnkasgitk, Henry Blow, and Allen David, make cause with Dave Hill, and he with young Jesse Kirk, and he in turn with Jeff Riddle, son of Frank Riddle and Winema, the heroine of the Modoc War, and with Henry Jackson, the wealthy exslave. In this sense at least E. L. Applegate was right when he observed:

> • [179] The tribal distinction among the Indians on this Reservation is
> [178] practically disregarded by the Indians, and the ancient preju-
> [101] dices are rapidly fading away. The general name of Klamath People seems to be superseding all other distinctions.[70]

[Klamath Reservation]

SEVEN

[P.95]

Social Change

WITHIN LESS THAN TEN YEARS AFTER THE RESERVATION HAD BEEN 648*
established, two communities had developed. The one at the 657*
Lower End was composed primarily of Klamath, with a small 361
number of freed slaves. Yainax was far less homogeneous. Near
the subagency were the Upland Klamath and the Modoc, while
some ten miles beyond lay Paiute Camp. With the beginning
of stock raising, the fine grazing lands of the Upper End drew
Klamath from the Agency side.[1] The Klamath Marsh settle-
ments, formerly the area of densest concentration, had been
abandoned as a winter residence in favor of warmer localities
about Upper Klamath Lake. Although O. C. Applegate later [731]
intimated the move was caused by losses from smallpox and other
introduced diseases,[2] the general advantages of proximity to
Agency and Fort may also have recommended it. Settlements on
the Lower End now clustered about the Agency and upon the
lower course of Williamson River. Only a scattering of houses
extended along the Sprague as far as Lilu's seat at Kawumkan
Springs, approximately ten miles above its mouth.[3] Beyond that
point, almost thirty miles intervened between the two com-
munities.

In their settlements, former foes were brought together: Peli- 657*
can Bay and other bands on the Williamson, Klamath and Wal- 648*
papi at Yainax. Band affiliations, which rested on kinship and 621
long association, continued to be strong for some time even within 619
the new settings. Thus members of the Pelican Bay band some- 177 •
times shared foodstuffs, and the claim that their parents stemmed 178
from the same tribelet long provided a bond strong enough to
enable one person to borrow from another. By the end of the
period, however, band identities had been largely relinquished
as peoples intermingled. In their place developed ties of varying

*657 strengths reflecting emergent neighborhoods; common employ-
*648 ment at the Agency, or as freighters and as work crews; shared
621 church interests; and, with time, friendships formed at school.
619 The growing importance of the adjacent white settlements and
• 177 the administrative colonies at the Agency and at Yainax set in
178 relief the larger community of the Indian reservation.

*657 Klamath relationships with members of the Agency staff seem
*648 to have been restricted largely to those demanded by their official duties. Their scanty numbers would in any case have made contact with them infrequent for the great body of the population, and the whites tended to maintain a closed community in their social relationships. An important exception to the general social insulation were some of the more acceptable members of the families of Indian employees, who were sometimes hired as help and thus received a conditional entrée to the houses of whites. Off the reservation, special protector-employer roles seem to have been assumed by such men as Sykes Worden, contractor and post trader at Fort Klamath, O. C. Applegate, and several others.

By far the most unhindered contacts were made at Fort Klamath. The freedom of the individual from social constraint in the early days is evinced in the situation John Meacham found.

> Certain Indian women [he remarked] . . . had established several habitations in the vicinity of the Agency. They were in the habit of hanging around the office, the quarters, private houses and other buildings of the Agency, losing no opportunity of insinuating themselves into the presence of the employes. They were saucy, impudent and lewd in the extreme.

He therefore placed the post off limits for women unless they had legitimate business, an order that "met with the hearty approval of the Indian men and the faithful observance of the women."[4] The practice was not stopped, however, and Dyar, who tried to institute a pass system to control the traffic, noted that "soldiers are in the habit of frequently visiting the Indian camps below this point—sometimes remaining over night."[5]

*657 Native marital practice posed no very great obstacle to a white
*648 who wished to consort with an Indian woman. In the nature of
563 things many of these unions were casual, but others possessed a more permanent character, though often common law in form. Indignant settlers in the Klamath Valley circulated a petition in

1870, demanding that whites living with Indian women and 657*
fathering children upon them be required to marry them or that 648*
the women be sent back and punished by law.[6] 563

The previous year, the Agent responsible for Indians in the vicinity of Jacksonville had reported a total of 60 Indians, 28 of them Klamath or Modoc, comprising Indian women living in casual unions with whites, together with their children. "The head quarters of the persons keeping these women," he continued, "is at Kanaka Flat about two (2) miles from this town. At that point there is an establishment called a 'Dance House' [547] where whiskey is sold and where women are plied with liquor and debauched in the most shameless manner." He advocated removing the women to their reservations, and this was subsequently done.[7]

As time went on, however, a small but growing number of stable marriages appeared in the areas fringing the reservation; and others, contracted about the same period, later came to light in more distant regions in the course of allotting tribal members. One such marriage was that of the Kentuckian, Frank Riddle, 648*
and Winema, the Modoc heroine of the war between her people 657*
and the whites. To judge from Meacham, who in turn quotes an 563
informant—perhaps O. C. Applegate, who knew the family well 177 •
—Winema was an early advocate for the acceptance of the new ways she herself had adopted.

> "In the evening you would see the women and men gather around Wi-ne-ma while she told them of the wonderful things she had seen among the white people, of their manners and social customs; of the laws and rules of life; of their way of making law; making machinery, its uses, &c. For hours they would listen while she talked, and to her, much of the advancement of the Indians at Klamath and Yai-nax may be attributed."[8]

Clearly, along with other features there were qualities of self-enhancement in her new role.

Few mixed couples even tried to remain on the reservation. 657*
The official and lay attitude was disdainful of "squaw men," and 648*
they in turn must have been reluctant to subject themselves to 563
the minute regulations of Agency life and the limited economic 167
opportunities there. Too, they may have found the kinsmen of their wives both abundant and demanding. For their part, the wives may have been eager to reach beyond the limited oppor-

balance, ascribed it to war and stated that in 1864, "the females 657*
were largely in the majority . . . a condition which continues . . . 648*
to this day."[13] 563
162

That the sources were indeed to be found in the conditions of native life is suggested by the circumstance that subsequently the imbalance was reduced: about 1875, the overall ratio was 0.72; while by the latter part of the period, from 1885 to 1906, it had reached an average of 0.87. It has since continued upward, to attain the approximate equality that characterizes the white neighbors of the Klamath.

Freed slaves constituted a second novel element in the popula- 657*
tion. Marriage to a slave had once been scorned, though Chief 648*
Chiloquin himself had married a Shasta slave; and even today 567
some stigma is attached to slave descent, albeit it is likely to be 178
brought up only as damaging gossip. Both sentimental family 177
attachments—a traditional attitude transcending acknowledged differences[14]—and recognition of the achievement of former slaves went far to ameliorate their position. One slave, Charlie Pitt, had been raised with his captor's son, Drummer David, in fraternal amity. The bond remained strong through life, and Charlie willed David his property when he died.[15] Another, one of three captured Pit River brothers, escaped to friendly whites who raised him in Ashland and gave him the distinguished name of Stonewall Jackson. In 1878 he returned to the Agency and the following year became a sawyer's apprentice. In recommending an increase in salary for him, Nickerson remarked that he "speaks the English language fluently, & is what may be called a civilized Indian." With several offers at better wages off the reservation, he wished to remain until he could qualify as a competent sawyer.[16] The best known of the slaves was Henry Jackson, whose rise has already been sketched. It is worth noting that he married the daughter of a Modoc chief, and that tribal members from over the reservation were not too proud to accept his bounty.

The altered social order was characterized by greatly in- 657*
creased mobility. An entire new range of opportunities was open 648*
to those who possessed or could develop new skills. Opportunity, 555
however, fell unequally, for the major new enterprises and posi- 177
tion in nineteenth-century America were masculine. As they were 178
incorporated into the regular activities of the Agency and within [562]

*657 the surrounding white neighborhood, the men came to take up
*648 roles narrowly and specifically defined in American terms and
555 to rephrase them in terms of their closest native counterparts.[17]
177 Thus, in the political field, judges and Indian police enlarged
178 the formal duties of office with some of the powers traditionally exerted by chiefs. Assimilation of roles, however, progressed in both directions; and in the end even relationships within Indian society upon the reservation were modified toward the American system. This was only partially the consequence of conscious imitation on the part of the Indians or of change directly instituted by the whites. In some measure, it came as the undesigned byplay of a modification made for another purpose.

*657 This, for example, was one of the effects of the educational
*648 system and its particular instrument, the boarding school. Be-
871 cause boarding school spanned the time of life upon which the
177 Klamath vision quest and the girls' puberty rite fell, those native
178 experiences were largely eliminated; and change of status was
[881] signaled instead by the final return from school. Education was designed for an altered future, but it increased intergenerational
[561] strife, as elders, their accumulated wisdom rendered obsolete in a changed setting, confronted youths skeptical in the superiority of their book-won knowledge. From the vantage of program, this was unfortunate—if inevitable—for the Agent depended for cooperation upon those same vexed adults.

To be sure, much of the change instituted might be regarded as supplementing and enlarging—rather than replacing—native content, for many a Klamath who was a schoolboy in those days today combines the learning of his elders with the lessons taught him in the schools. Participation in two orders juxtaposed for them made manifest the relativity of each one. For those youths, the new order was not to be taken on simple assertion; it had to demonstrate its superiority in a manner not required by those born into it.

*657 With all the changes that tended to distort the social order,
*648 women were less directly affected than were their husbands and
562 children. Their roles were still principally internal to the family,
177 as wife and mother; and though opportunities for employment
178 were beginning to open for them in the schools, their contacts with the ambient American culture were more fleeting and more

K

circumscribed. Because the step involved a wholesale commit- 657*
ment, those bold enough to marry whites, as already noted, 648*
tended to pass out of reservation society. One or two women in 562
the early days sought to demonstrate they they could support 177
themselves as well as men were capable of doing, but they were 178
clearly exceptional.[18]

K
Confronted by shifting social values, tribesmen on the reserva- 657*
tion still could take assurance from a value acknowledged both 648*
by the whites and by their traditional culture. The high prestige 556
assigned to industry and to its material manifestation, wealth, 181
proved a common denominator upon which to rank the ability of 178
men engaged in new activities. In the new day, Plains garments, K
horses, and slaves were outmoded, and were replaced by a house [177]
and outbuildings, a fenced farm or ranch, wagons and buggies,
and plenty of livestock.

K
Within this context, the family also changed as movements 657*
within the reservation, the construction of smaller frame dwell- 648*
ings, and the cultivation of individual farms reduced household 592
size to approximately that of a single conjugal family. Some idea 177
of the shift may be gained by comparing subsistence rolls from 178
the administration of Lindsay Applegate[19] with data from the
end of the period. A summary of issues made in 1872-73 to heads K 657*
of families of Klamath, Modoc, and Yahuskin Snakes lists 54 648*
families totaling 658 persons. The majority were from Klamath 592
Marsh, with some from Link River and Sprague River bands and 162
several Modoc. One is possibly Paiute. The other two pages N M
duplicate some of the individuals, listing Schonchin's band of 657
Modoc, some eight "houses" comprising 97 individuals; Ocheho's 648
band of Warner Valley Paiute, 17 "houses" and 161 persons; 592
Chocktoot's band of Paiute, 13 "houses" and 113 persons; and 162
the Sprague River band of Monchnkasgitk, 8 "houses" and 97
individuals. A tally made in 1866 by one Jackson Jones (Link
River Jack ?), "Chief of Ulalona," lists for the Link River band
22 men, 18 boys, 42 women, and 20 girls in five houses.[20]

An analysis of these three lists reveals interesting facts about K 657*
the contemporary social groupings. Where the two censuses over- 648*
lap, there is overall agreement, although the figures for individual 592
households differ slightly. For the census of the Klamath at 162
large, the average household size is approximately 12 persons,

Of all the societal
relationships, the ~~government~~ *Social Change* sought directly 103
to change only those within the family. It was clear that a nation 657*
that was soon to impose upon the Mormons the American, and 648*
not the Biblical family, would permit no special marital practices 595
among the Indians. Polygamy was banned, although not retro- 177 •
actively for unions such as those of Allen David and Monchn- 178
kasgitk, which had been contracted prior to January 1, 1870.
Some leaders themselves appear to have advocated the change in
a desire to emulate whites. In 1877, Gatschet noted that there
were still two or three polygamous men.[26] Since polygamy had [556]
been a mark of the affluent, the ban, like the emancipation of the
slaves that preceded it, served to erode the status of the tradi-
tional chiefs.

An effort was also made to place under the authority of the 657*
court of chiefs certain relationships which had formerly been 648*
regulated privately between the families or individuals con- 622
cerned. In the legal code instituted when the court was estab- 692
lished, the consecration of marriage was made the function of 685
the head chief, to whom the groom was to pay a fee of five, three, 583
or two dollars or the same amount in horses, graduated according [643]
to his means. It was again the chiefs who punished fornication [684]
and polygamy and performed divorce.[27] The traditional ritual [586]
of marriage still was being practiced by some families in the 1890's[28] but the gift exchanges between the families concerned which set a public seal on the union were superseded, and the controls exerted by the family over the couple were thereby diminished. The effects of these and other changes were recognized by Gatschet. "Matrimonial reverses . . . among the Klamath [he declared] . . are one of the unavoidable consequences of the gradual emancipation of the females from the former rule of their brutal husbands through the advent of the whites, and also of the obnoxious and corrupting neighborhood of the soldiers at Fort Klamath."[29]

With time, the seal upon marriage came to be set by the 657*
Methodist church and its ethics in turn permitted the independ- 648*
ent of spirit to flout tradition. One woman recalled that upon 581
the death of her husband his family proposed that she wed his 587
brother in customary manner, but she refused out of regard for 177
the memory of her husband and the sanctity of the bond of their 178
marriage in the church.

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*657 The removal of property interests in the marriage on the part
*648 of the natal families of the couple, together with the general
581 upheaval of society, brought to the fore the practice of common-
588 law marriage, previously an unusual form of union. In time, such
• 177 a marriage, if generally acknowledged as stable, was officially
178 termed an "Indian custom" marriage, and recognized by authorities and Indians alike. Many unions, however, were unstable, and genealogies reveal that then as now it was common to find individuals who had had as many as three mates. Indeed, the woman previously mentioned as refusing to marry her husband's brother subsequently consorted informally with her ranch foreman.

*657 Thus by the end of the period of its firmest control, the gov-
*648 ernment had altered the family in form to correspond to that
177 idealized in American society. It had done away with the special
593 status of slaves. Children were removed from the physical cus-
[567] tody of their parents and sent away to school, to be returned as adolescents at odds with the ways of their parents. These were individual measures, not calculated for their total impact. The approach to social, as to other aspects of change, was predicated upon the individual and upon the conjugal family. It failed to envisage the need to create bodies that would give strength and continuity to a reservation community.

> *657 To prevent a *practice* is one thing, to change the belief in the
> *648 theory which actuated that practice is quite another thing. Thus
> 756 while it is very true the *practice* of medicine by Indian doctors
> 178 is abolished yet I am fully warranted in saying that there is not
> half a dozen Indians on the Reservation who are not as firm as ever in the belief of "spiritual medicine." Even Head Chief Allan David grave, sedate, and logical as he is in most things, acknowledged to me the other day that he *still believed* and was afraid to punish the Doctors.[2]

Notwithstanding his appreciation of the difficulty in eradicating belief in this way, Meacham continued to war against the shamans, causing Link River Doctor, whom Knapp had imprisoned, to be arrested and tried for having openly defied the order against shamanistic practice.[3] Meanwhile, he hailed the ministrations of the agency physician as demonstrating "that an efficient, patient and intelligent physician can do more than almost any other person in rooting out thier [sic] faith in thier own 'spiritual' medicine, and thus opening the way for the white man's customs, laws and religion."[4]

Not all shamans were initially singled out, for many were held in esteem. Of his paternal grand-aunt, a shaman, a present-day informant recalled, "She was like a preacher and all respected her. Chief Chiloquin always called her first when he had a meeting because she had a good brain. . . . Sally had a strong power
*657 [i.e. tutelary spirit]. . . ."[5] Tecumseh, an early Agency employee
*648 and Dave Hill's companion during the lyceum tour of 1875, was
756 a noted shaman. It was the parvenu chiefs, replacing Lileks and
754 Chiloquin, who abetted the Agents; and initially, as in the code
622 set forth by Dave Hill, their censure was directed only against
• 177 sorcery. Indeed, Hill's wife wrote him that she had taken their
178 ailing child to a female shaman to be cured.[6] As Henry Blow
remarked, "Since there is a white man's law among us the doctors are afraid to kill for malice or money as they did long ago, but exert the same power to heal the sick as they did."

*657 Significantly, when the court of chiefs tried Doctor John, a
*648 shaman, for having bewitched and thus slain another, the chief
756 witness against him was Sally, the woman shaman mentioned
622 above, who testifyed that in her dreams her shamanistic powers
177 had seen those of the accused.[7]

178 In 1880, Nickerson took a further step toward reducing the
[754] number of shamans, but thereby gave those who remained a

measure of official sanction. “I have recently induced their chiefs 657*
and people,” he reported, “to dispense with one half or more of 648*
their native doctors, each chief and his people selecting one to 756
retain. They came into this plan more readily than I had appre- 622
hended.”[8] On a visit to the Agency, Lindsay Applegate came 178
upon the new system and, in a letter bristling with indignation, 177
wrote “[Nickerson] turned to me and remarked that they ware his indian docters that he had invited the indians to furnish to practice with his docter at the same time [.]”[9]

Meanwhile, the growing success of the medical program upon 657*
the reservation sapped the authority of the shamans in what was 648*
their last legitimate field. The personality of Dr. Royal, who had 756
doubled as chief of police, apparently did much to win over 164
some of the chiefs, as did his treatment of syphilitic cases among 177
the Indians. (Since, as Roork had remarked, the disease had been 178
contracted by Indians in the course of their annual trading trips to Oregon City and other points,[10] it may have had a higher incidence in chiefly families.) They desired to retain him and, wrote Nickerson in advocating this, “Should he remain permanently the chiefs have agreed to do all they can to do away with their Indian doctors. These Indian doctors have heretofore had almost unbounded sway over the people.”[11]

In outlawing shamanistic activities, the Agency in effect drove 657*
a wedge between the shaman and his ritual assistants: the inter- 648*
preter, caller, and singers. Since a curing seance was a public 756
demonstration, it involved too many participants to be concealed 177
easily; and the shamans, formerly among the most respected and 178
feared members of the tribe, were not given to skulking. More- [178]
over, in native theory, supernatural power waxes with use; and when performances were no longer given frequently, that power declined.

Recalled H. N.:

> I always seen David Hill go among the people and interpret the agent’s words. Sally [the shaman] said, “I didn’t do it myself, but my medicine do it. It’s up to my medicine. If I do it, it’s the medicine’s fault.” But David Hill said, “It’s better for you to quit than to have trouble for yourself, or your family. That’s what the agent wants.”
>
> . . .
>
> Nobody ever called her after the orders were given. They might help minor things. I watched Sally. I watched her doctor.

> *657 She worked all night once, and I thought there must be some-
> *648 thing to it. But her power got small. You know what the Chris-
> 756 tians say, "Backslide," not working strong enough. She said, "My
> • 177 help is getting small."[11]

178 Alec Wilson was a shaman, one of perhaps three in the lower
Williamson River area. After the Agency had outlawed shaman-
istic curing, he gave up his practice. Later, his child fell ill. His
wife railed at him, "You call yourself an Indian doctor! Why
don't you do something? Can't you see your own child is dying?"
Helplessly, he explained, "My tricks [i.e. powers] are all gone,
have left me; I can't do nothing without my tricks."

Though prohibited, shamanistic activities continued into re-
cent times. In 1897, Emery dealt severely with two instances of
curing at Paiute Camp, awarding a month at hard labor each to
Doctor Sam and Tom Godowa for attempting a shamanistic cure
of the latter's daughter and a week in jail to Tom Chocktoot,
headman of the Paiute, for a similar effort on behalf of Pete
Pauline's daughter. Chocktoot had also to return the sack of flour
K and blanket he had received as his fee.[13] A number of adults who
[838] were products of the boarding school recall the transvestite
shaman, White Cindy. One man was cured by him in the early
1890's;[14] and a woman who fell ill through dreaming of him
underwent the required shamanistic cure, although she was a
Methodist. Henry Jackson is said to have retained shamans to
perform cures at his house, and he is widely suspected to have
hired the assassin of the Modoc shaman, Doctor George, in 1899,
* K on the suspicion that he had encompassed the death of his sons.[15]
*648 While the campaign against the shamans was proceeding,
*657 other events had taken place. In 1871, a Paiute had introduced
756
668 upon the Upper End (Yainax) the nativistic Ghost Dance reli-
177 gion; and Doctor George, at that time not yet a shaman, had
M
648 brought it to the Tule Lake Modoc. There it was taken up by the
657 Modoc shaman, Curley-haired Doctor, and played an ideological
756 role during the Modoc War. A Klamath commoner named
668 O'Toole brought the religion to the Lower End, at the Lakes,
177 where a dance was organized by Allen David (then head chief),
Lobert, a headman and shaman, O'Toole, and Frank Chilks,
another commoner. No Agency employees among the Indians
participated.

648ff

After the end of the Modoc War, a second movement, the 657ff
Earthlodge Cult, was brought to the reservation by two Pit River 668
Indians, Henry Jackson and Pit River Charley, who had learned 177 •
about it while visiting relatives in northern California. Shortly 178
after this cult was introduced, a delegation of Klamath and Modoc from both Ends of the reservation visited Falls City, California, and Fort Crook to witness dances and seek the "message." Gradually, the Earthlodge Cult passed into a second phase, known as the Dream Dance. At the Upper End, the leaders were again Doctor George and Monchnkasgitk, while at the Lower they included Allen David, Jason Howard, a commoner, Chanchan, a shaman from Pelican Bay, O'Toole, and Lobert. The Paiute abstained from both the earlier and the later phases of this cult. The movement effectively stopped about 1878 with the building of the Methodist Church.

Nash, whose account has been followed here, has set forth the ritual and the theological content of each movement and has convincingly analyzed the social tensions and individual drives, so far as they can be recovered, that gave significance to the movements. The Ghost Dance was given antiwhite content by the Tule Lake Modoc, but not by the other groups. [184] The Earthlodge Cult, on the other hand, was strongly antiwhite at the Upper End, but not at the Agency. Around this time the Indians were becoming alarmed by reports that they were going to be exterminated by the troops and agitated by the boundary line and military road disputes, which especially affected the Upper End. Such fears may have contributed to the growth and local character of the Earthlodge Cult.

Viewed together, these movements constituted a progressive accommodation to the Klamath scene. As Nash characterizes it:

> The Ghost Dance represented a sharp break with Modoc and Klamath ritual tradition. The Earthlodge Cult was more in accord with this tradition, and the Dream Dance was still more consonant with it, and in the course of its development became incorporated into it. At the same time the aboriginal distinction [756] between the ritual experience of shamans and the ritual experience of nonshamans was broken down. Participants in the Dream Dance, particularly the strong dreamers, began acting like shamans; and shamans who participated in the Dream Dance acted more like ordinary men. . . . As the Dream Dance grew older, the traditional gap between shamans and non-

*648
*657
668
•177
178
756

shamans widened again as ordinary people ceased dreaming, and shamans incorporated Dream Dance symbols and practices into their rituals.[16]

*648
*657
797

While these nativistic movements were going on, the first steps were being taken to provide Christian training to replace the native faith which was being discredited. In 1872, Thomas Pearne, an educated Indian from the Yakima reservation, had been appointed interpreter. During that year, until his resignation to return to Washington Territory in the following spring, he carried on missionary work among the Klamath, bringing thirty-six into the church. Among them was Lileks, who at his death three years later was numbered among the "Praying Indians."[17] [622]

The following year, the Reverend James Harer was appointed Commissary at Yainax, where for a brief period he preached at religious meetings which were well attended.[18] By 1876, the Agent at the Lower End and the farmer at Yainax still were holding forth. Employees had volunteered to advance half the salary for a missionary if the Methodist Missionary Society would match the amount; but nothing came of it.[19] Roork, the following year, took a number of the principal men and women, along with some scholars from the Indian School, to the annual conference of the Methodist Episcopal Church in Salem, probably in another appeal for a missionary.[20]

The flavor of those early meetings is preserved in one of the letters to Dave Hill, dictated in 1875 by Allen David.

> After we had had our talk at the Agency I sent word for all the people to come to my house to talk about these things, and see who would agree to listen to what Dave, Tecumseh and I had said, and who would get our hearts and who would not. I told them to come on Sunday the Lord's day and we would all the same as mammook [make, hold] church, we would make good hearts and the Lord would mammook close nanish [take good care of] us on his day. So some Yainax Inds.—Brown Mosenkosket and some Modocs, some Lake Inds., some Chiloquin's people and some of all the Inds. came. Chikaskane first spoke and said that at first he had a bad heart. That the chiefs first listened to the Agents and got their hearts and then tried to get the other Inds. to get the same hearts; that they had put him in the guard house which was right, and Mr. Dyar was also right for he was in the wrong and all the same as said to the Chiefs

*648

797

> Make them better men and women." He was a Methodist preacher and was a big man. He had a loud voice and was a good singer. He was awfully strict. He didn't want the Indians to get into trouble. He said, "If you don't mind me, I will put you in jail or put a ball and chain on you." And he did. So the Indians behaved well, you know. I understood what he said, and it sounded good to me and after they interpreted his sermon in Klamath, the old Indians liked it too. Testimonies were then given. . . . The preacher read from the scriptures and made sermon. . . . He said, "I want people to come together and work together as one."[illegible]

The emergence of native preachers provides another illustration of the confrontation of native and American roles. From the Indian viewpoint, the role of shaman did not coincide with that of the American preacher, for in aboriginal times the shaman's duties had encompassed curative powers, and through sorcery and counter-sorcery he had come to wield quasipolitical influence as well. Now healing lay within the duties of the Agency physician, while political sway had passed progressively, first to the raid-and-trade leaders and latterly to the Agency chiefs.

*648
*657
793
622
537
177
178

On the other hand, points of resemblance existed between the traditional role of the chief and that of the preacher. The sermon, the most distinctive and formal exercise of the minister, as the Indian saw him, corresponded most closely with the exhortations to a better life given by chiefs to followers and by elders to the young. The correspondence of preaching with political authority was furthered by the circumstance that a number of Agents had assumed the responsibility of preaching to the Indians. Among those realizing the linkage in their actions were Dave Hill and, to a lesser extent, Lileks, Allen David, and Henry Blow. Jesse Kirk, soon to become a preacher, later applied that office to political ends.

In the Klamath view of the supernatural order, syncretism set in early, probably as the result of an Indian effort to reconcile native and Christian belief. The trickster-transformer figure of Gmukamps, known in myth by the epithets, "Earth-Maker" and "The One Above," became identified by some with God, although his trickster exploits led others to reject this. Within the first decade of reservation life, Christian dualism, seizing upon the first correspondence, became responsible for the coining of

another figure, known only as "The One Below," to represent the 648*
Devil. This figure appears in a Klamath version of the Garden 657*
of Eden recorded by Gatschet[29]—a tale no longer recalled today. 776
The identification of Gmukamps with God is strengthened in 177 •
Indian eyes by his mythical foster-parentage of the hero, Aisis. 178
As one Modoc, a fundamentalist preacher, has put it:

> you know, Gmukamps and Aisis—that's nothing but God and Jesus. The Indians knew the story of the Bible, but they were ignorant in those days. They thought that the lakes they performed their miracles around were the Klamath lakes; they didn't know it was really the Sea of Galilee.[30]

Looking back over the entire field of change from the last 657*
decades of the nineteenth century, the observer could discern 648*
major acculturative trends. The Klamath who entered upon the 177
treaty had already undergone pervasive, though largely un- 178
directed modification. Thereafter, they were subjected to a consistent policy of change which, despite defects in execution, outside interference, and an intervening war, was maintained for well over a generation. Within this frame, a reservation culture had taken shape, embodying a synthesis of white and Indian lifeways. By the middle of the next century, only a handful of tribesmen would be left who could report from direct knowledge events of pretreaty days; the remaining elders would be products of the synthesis.

Measured by the indexes which the Bureau employed to
register progress, the advance was evident. When that formula- [464]
tive period was ended, a large number of the Klamath were [511]
productively engaged in work of "civilized" character, and their
material wants had come to approximate those of their white
neighbors. Many were conversant, and a few literate, in English, [191]
and their numbers were increasing steadily. The extended family, [212]
at least among the progressive, had made way for the more [596]
mobile and assimilable conjugal family. In the schools, a new [594]
generation was being trained to embrace as natural and desirable [871]
a way of life which the Church, in turn, commended as good to
old and young alike. Expectations seemed to lie within the grasp
of those willing to work to achieve them.

Beneath the surface upon which these changes could be traced, [571]
however, lay cleavages and disconformities as yet unfathomed

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 that were to threaten their success. Under the pressure of change,
*657 the Klamath had responded in diverse ways and had drawn
• 177 apart. A program addressed to a single people–if drawn from
178 several tribal cultures–had now to cope with a growing variety
571 of subgroups shaped by the acculturative experiences they had
undergone. Loosely structured as the native societies had been, they had nonetheless been clearly delimited. Participation in American culture now greatly extended their limits, and beyond the reservation the simple clarity of the social relationships they knew soon became distorted. As they participated in the life that went on beyond the reservation, the Klamath grew conscious of roles that not merely diverged from those of native society but at times were even lacking there.

In the new setting, expectations blossomed, on the part of whites as well as of the Indians, for which the reservation provided inadequate soil. A central goal in administrative planning was the inculcation of individualism, a characteristic ideal of American society of that day. The pursuit of self-interest must, however, have its limits; otherwise it trespasses upon the interests of others. Even in the days of the "robber barons" of nineteenth-century enterprise, American culture provided a context of value and structure within which individualism flourished, and which set limits upon untrammeled license. On the reservation, the creation of a similar context proved difficult indeed; it might even be said that the planners seemed unaware of the need to establish such restraints. As a result, they left the field free for the burgeoning of narrow self-interest.

Tribal society had been small in scale,[31] marked by scanty numbers and intensive face-to-face relations. Self-interest had been present here as well, but it had been subjected to major restraints by family and village. In transforming this society, the Agency had placed a premium upon explicit and formal controls exercised by its staff and by those Indians closely dependent upon it. A major characteristic of reservation society was the extent to which the Agency had become implicated in its being. Administrators, seeking to transform that society, strove to remove a strictly Klamath leadership as an intermediate variable in control, in the well-founded fear that such leaders might prove too independent. In so doing, they enlarged the gulf separating

political authority from the governed. The Klamath, in turn, be- 657*
came increasingly unresponsive to political control vested in an 648*
alien administration. Consequently, when the Agency later be- 177 •
came aware of the need to limit the growth of rampant individ- 178
ualism, it no longer was heeded. Moreover, the dissolution of 571
other restraining bodies had gone on apace, until at the end of
the period of control there were left as social stabilizers only a
weakened extended family, shifting neighborhoods, and the
followings of popular, informal leaders.

On the threshold of allotment in severalty, with its further stress upon separatism, the prospect was not auspicious.

[P. 122 is blank]

[Klamath Reservation]

share of the principal from the tribal fund, the per capitas, 648*
begun two years before, were flowing in from timber sales. By 657*
1926 they were $500 annually, and four years later had risen to 434
$700. Though they thereafter declined slightly, they rose again to 313
a figure in excess of $800. Acess to these funds gave the Indians a considerable measure of economic independence. A family of four, at the 1926 figure, received $2,000 from timber receipts alone, an income sufficient to provide for all their needs or to indulge some of their luxury cravings. Where "money talked," it afforded access to many areas previously closed. Having money gave at least partial emancipation from Agency surveillance.

Indeed, from the days of allotment on, the growth of a money 648*
economy upon the reservation had been an emergent theme. 657*
Amounts of money that Indians had been able to secure prior to 434
that time, though important in their economy, had not given them 452
the same degree of independence as was later to be theirs. After allotment, anticipation of income from leasing and from other
sources increased the volume of purchases on credit. To his [454]
knowledge, Emery reported in 1897, no Indian had funds deposited with the Agent or with any bank, firm, or person.[102] Although in the next few years O. C. Applegate transmitted checks drawn by a number of Indians to cover debts they had incurred, the practice was less a payment from accumulated savings than a convenience in handling money. What the correspondence strikingly shows was the practice of buying on expectation. Then as now risks were involved, and many individuals in the parlance of the day were rather difficult to "bring to time." That difficulty had sometimes to be surmounted by asking local men of property, such as Henry Jackson, to stand behind an impecunious would-be customer. At times the Agent exerted moral pressure upon a delinquent debtor, but under some conditions he declined to serve as collection agent. Repossession of property for nonpayment often ran against the jurisdictional barrier of the reservation line.

Along with access to individual real property went the transla- 648*
tion of traditional relationships into a more pecuniary idiom. Such 657*
tribal members as Robert Wilson and his wife, William Crawford, 178
and Jesse Kirk purchased insurance policies.[103] A number of 571 [177] •
Indians hired farmhands, both white and Indian, instead of draw- [464]
ing exclusively or even principally upon kinsmen.

reserved for Indian cattlemen was ample, and that indeed the 648*
tribe was losing between $6,000 and $8,000 a year on land with- 657*
held for their use but not grazed. "Even this, he went on to say, 423
"did not seem to satisfy a number of Indians, and as a result the 427
tribal council recently [1926], passed a resolution to close the 563
range next year." He recommended that the Bureau disapprove 311
the tribal action.[122] During the remainder of his tenure, the issue of leasing the tribal range recurred at least twice more; and it arose from time to time to plague his successors.[123]

The desire to convert equal access to tribal resources into a pro 648*
rata share of rentals found a counterpart in such measures as 657*
those involving tribally supported programs for lumber. The lum- 313
ber mills operated for years by the Agency had been partially intended to supply materials for building houses and barns, but by 1908 only the mill at Yainax remained, and the Indians were no longer bringing in enough logs to keep the sawyer busy.[124]

With the establishment of sawmills on the reservation, the government mill drew less and less traffic. It was moved to a new location in 1927, but although there was no commercial sawmill within twenty miles, business was not measurably improved.[125] By 1930 it functioned only a short period each year for those members who wished to haul their own logs and pay twenty per cent of the lumber to defray milling expenses. Reported Arnold:

> During the past two years a few disgruntled Indians who do not avail themselves of the opportunity of obtaining lumber through their own efforts have objected to its operation on the theory that is being operated at the expense of the tribe for the benefit of a few of the Indians. Due to this criticism, the future of the sawmill is uncertain.

Soon thereafter the mill was closed.[126]

These were some of the expectations among the Indians created 648*
by increasing contact with a free-enterprise system. Individuals 657*
came to see that tribal membership entailed not only the restric- 619
tions imposed by Agency regulation but pecuniary returns as well. [177] •
Those members dwelling off the reservation discovered that they could realize their pro rata share of tribal income without being subjected to supervision in expending it. Moreover, insofar as the Superintendent was willing and able to take decisions into

[Klamath Reservation]

THIRTEEN

[P. 185]

Modern Klamath: Demography and Economy

ALTHOUGH THEY LACK THE DRAMA OF CULTURAL CONFRONTATION, 648*
the years since the barriers of the reservation crumbled have 657*
been eventful ones for the Klamath, and deserve minute study. 619
The wealth of material makes such a treatment inappropriate, 177•
and recommends instead a summary approach. Viewed as a 178
whole, a half-century of change has been marked by progression, with no major discontinuities. Geographically, physically, culturally, and socially, the Klamath lost special attributes they had once shared; yet, held together by a joint history, through participation in a tribal government, and by interest in a tribal estate held in common, they retained their identity as Klamath. This was a period in which, compared to the dominant society, the Klamath passed into a condition of reduced power, unable even to control the tribal assets save through a veto, constituting an ethnic minority in the communities where they resided, even within the reservation.

One of the indexes of latterday Klamath diversity has been 648*
their geographic distribution. At the turn of the century, approxi- 657*
mately ten per cent of the tribal membership resided off the reservation.[2] By 1955 the number had mounted to over forty per cent; and three years later, after termination, it exceeded fifty per cent of the Tribe. As had been true earlier, the absentee members were grouped concentrically about the reservation. Perhaps a quarter of their number resided within Klamath County in towns adjacent to the reservation. Outside the county, they were scattered throughout areas of southern Oregon and northern California where Klamath had long had ties. Along the

*648

*657 missiveness. Their ranches often took on the appearance of rural
464 slums, and were the scenes of drinking parties and brawls.
433 Economically profitable or not, ranching constituted the most
233 common occupation for those who were employed. It offered special advantages. The land was usually an inherited allotment and, together with cattle and improvements, was often nontaxable. Outdoor work with livestock was a familiar activity; it permitted considerable latitude to the farmer in adjusting his routine. There was space to live.

*648 Whether dwelling in town or on a ranch, tribal members
*657 continued to seek native foods; but these activities had come to
433 occupy a different place in their lives. Men of all ages still fished
and hunted; many families still gathered huckleberries; and
22 elderly women at least continued to dig for the succulent roots
262 of ipos and camas and to gather wokas. The latter foods, how-
177 ever, were sought as cherished delicacies, now rare; while
178 journeys to the berry fields assumed the character of an outing. Much of the fishing had acquired a strongly sportive aspect and was carried on by angling. Only the spearing of mullet during the spring runs and the hunting of deer and waterfowl seriously served food demands. The larger game animals, which had figured in only a small way in Klamath diet and played a more important role among the Modoc, had become abundant upon the reservation as ranchers killed off predators. Tribal members often hunted them from a car or spotlighted them at night. Waterfowl were often shot as they sat upon the water. Fifteen deer would see a household through the year; and a number of Klamath families met all their meat requirements by hunting and fishing, being content to buy an occasional cut in town to add variety to their diet.

*648 "Meat hunting" thus continued to ignore sportive conventions,
although fishing had in part given way to them. At the same
*657 time, individual Klamath were wont to play with those conven-
224 tions by entering contests for the biggest buck or rainbow; and
226 they delighted in underscoring white failures to abide by their
181 own standards of sportsmanship. For the Klamath, hunting and fishing possessed particular virtue as an attribute of an Indian estate. The ability to pursue fish and game without regard to season was a signal right cherished by the Indians and valued

*648 theless, analysis showed that they aggregated two extended
*657 families together with one other nuclear family unrelated to
602 either. The earlier arrivals had attracted relatives, but they had
178 been selective, encouraging some and in at least one instance
giving the cold shoulder to a kinsman deemed undesirable, when he paid them an exploratory visit. For their part, they were scrupulous in choosing compatible relatives to visit on their occasional brief returns to the reservation.

[736] That kinship bonds, selectively utilized, were still in force is shown not only by such action as the bidding for tribal tracts, but in the assumption of responsibility for the care of children from a broken home. Although choice was exercised among relatives, and the uncongenial among close kindred might be passed over in favor of more distant, but more compatible, relations, the principle first evoked was that of consanguinity. In the majority of instances, primary reliance was placed upon parents and children, upon siblings, grandparents, and grandchildren.

*648 Among kinsmen, there was an enlargement of the sphere of
*657 individual, at the expense of common, property. At times it took
602 bizarre extremes. In one adult household, for example, each
421 member's foodstuffs were separately stored and even individually
• 177 cooked; and each independently purchased his supply of the
178 wood to be burned in a common stove. There was evident in
family interdependence what might be termed a pecuniarization of relationships, a conversion of traditional reciprocal obligations into the common denominator of coin. Already evident in the early days of allotment, it had grown with time, taking on as it did a onesidedness that was increasingly dysfunctional. Money could be extracted by the importunate from kinsmen still sensi-
[888] tive to the charge of stinginess. The aged, dependent upon their children for tenderness, were often likely to be besieged by their requests for "loans" from lease and per capita checks, and once those funds were dissipated, might then be left without enough to maintain themselves. Some families, like the ranchers previously described, were beginning to resist such demands, but for those still immersed in tribal society, refusal was difficult.

*648 The weakening of kin bonds entailed the disappearance of
*657 feud groups, entities that formerly had drawn principally upon
602
578
177
178

kinship loyalties and that had provided relatively stable focal 648*
interests about which allegiances might cluster. The anonymous 657*
destruction of property as a time-honored method of exacting 602
personal revenge remained even in the last days of the reserva- 578
tion, when the jacklight shooting of a cow was construed as the 178
malicious act of a foe. Distrust thus engendered was likely in 177
turn to lead to a search for potential allies, especially among kinsmen and cronies. Local legend in Chiloquin still recounts the memorable gunfight between two tribal families in the days before its incorporation, one firing from the railway depot while the other entrenched itself in the family hotel. At the first few shots the stationmaster, a newcomer to town, was flushed from the depot; and when the fusillades were stilled he left town, never to return.

As law and order became more firmly established over the reservation, and extended families, their members scattered on separate allotments and among the reservation towns, became
dispersed, retaliatory obligations declined. In the end, feudatory 648*
alignment left their mark chiefly in a continued reluctance of 657*
former opponents to drink together or otherwise associate. The 602
drinking cliques, with their stable membership cores, reflected 578
these antipathies: three decades after the gunfight mentioned 273
above, the families involved still did not consort together. Only 178
one person, and she an affinal, had crossed the line. 177
[573]

Indeed, the violence of more recent years, as remarked, lay far less between families than it did within them, for many of the quarrels that precipitated assaults arose in the course of drinking parties, and thus antagonized persons who were accustomed to associate together. Although there was a degree of mobility in the membership of such parties, and clashes at times might involve a visitor, many instances of homicide arose out of family disputes. That the tensions thus vented were generated by the changes in familial roles seems at least partially true, to judge by an examination of court cases; but they were affected indirectly by other segments of the psychosocial system, such as the relations with whites. Such disputes, however, could only weaken the family, and that at a time when family solidarity had become a less imperative need.

Within the reticulation of familial roles, the traditionally 000

Within the
*648 reticulation of familial roles, the traditionally
*657 esteemed attributes had lost place. Age was no longer accorded
561 respect, for the wisdom of experience seemed irrelevant under
593 the new conditions, and in the environing society the emphasis
577 was upon youthful qualities. The premium upon industry as an
434 ideal for old and young alike had become submerged by the
178 golden flow of per capitas which rewarded equally the wastrel
• 177 and the unremitting toiler. Remarked one man wryly, "I can
make more money raising Klamath than I can raising cattle."[2]
Under these changes, paternal authority had declined sharply.
"Why should I listen to you?" demanded one adolescent son of
his father. "I've got just as much money saved up [in a compulsory trust fund] as you have!"

*648 By contrast, the status of the mother within the household
*657 had been enhanced. Housekeeping and child rearing constituted
562 concrete activities that possessed a high measure of continuity
434 with the past, of a type normally respected in her counterpart
177 in white society. Access to her own per capitas had raised the
178 economic standing of a wife to a par with that of her husband.
[623] The relative changes in local roles, together with the passage
of woman's suffrage in the nation at large, had become reflected
in the increasing prominence of women in the debates of the
General Council.

*648 The major point of contrast between white and tribal house-
*657 holds on the reservation was the relatively greater fluidity among
563 the Klamath, as reflected in the record of sequent marriages,
58 the figures for common-law unions, and the broken families. In
this respect, Beatty did not differ significantly from Chiloquin.
Interethnic marriages—those between a Klamath and a nontribal
partner—were more stable than those contracted between tribal
members.

*648 Household composition makes it clear that the traditional
*657 valuation of kin had by no means been entirely relinquished.
592 In a number of instances, Klamath, particularly women, had
587 taken in the children of collateral kin. Remarriage produced
[178] composite families, in which the couple reared not only their
own children but the offspring of previous unions of one or both
partners.

*648 Consequently, Klamath households exhibited a diversity of
*657 form, size, and composition, frequently characterized as well by

[Klamath Reservation]

*648 *657 563 where after attending public school or the Catholic academy, she took special training or found a job. About that time she met her future husband, a white employed as a laborer in logging, millwork, or construction. Evidently, he then stood below her in socioeconomic status, although in a superior ethnic bracket. The subsequent advance of the husband, after their marriage, may be regarded in no small degree as the result of her own drive and ambition as well as his. Such couples rarely returned to the reservation; and their life together was undoubtedly an extension of that first step, before they met, which had taken her away from the reservation.

ACCULTURATION

*648 *657 • 177 [171] [434] The suggestion has recently been made for the Ojibway that the sociocultural position they now maintain on their reservation in Wisconsin represents an accommodation to the standards of living of lower status whites.[11] At Klamath, the circumstances that might have reduced tribal members to a similar economic condition have been offset by income from leases and from tribal timber. The question may still be posed, however: to what degree does Klamath life on the reservation represent the direct acculturative influence of those whites, particularly of lower-class status, whom they most closely approximate?

The historical record, already reviewed, shows clearly that many early contacts of a persistent character were with whites whom Agents with some justification regarded as outcasts or renegades from their own society; but, their influence although it was undoubtedly felt, did not compare with the broader programs of the official staff, directed at the whole Klamath population and implemented through influential leaders. A few individuals such as Frank Riddle stand out; but their own ties tended to be with administrators like Oliver Applegate. The major individuals to offer opposing counsel were former Agency employees or individuals of substance in neighboring towns. Klamath recognized the tokens of success, and were unlikely to follow persons who showed every evidence of failure in their own lives.

There is some warrant for seeing in the Klamath situation a structural convergence. On the one hand, the skills and roles acquired by Klamath in the early days of the reservation during

the course of their employment by whites—to mention but one 648*
sphere—were even then associated in American society with 657*
inferior status, as involving largely manual labor. The course of 177 •
technological change tended to reduce those skills further in prestige. The Klamath remaining upon the reservation generally confined themselves to occupations of this level.

In these and similar contexts, tribal members entered into [464]
relationship with whites, both as coworkers and as employee or rarely—as with Henry Jackson's hired hands—as employer. Within this context, they had the opportunity to model behavior upon a wide range of examples, and were not restricted to whites of similar socioeconomic status. The Klamath girls who worked as domestics in Klamath Falls at the turn of the century had many opportunities to observe the life of middle-class families.

Yet individual change is only part of the picture, interwoven 648*
as it often is in the fabric of institutional change. In such a struc- 657*
ture as the Indian Shaker movement on the reservation are to 795
be seen the summation of a number of individual commitments 177
to a new creed, and thus the emergence of an institutionalized 178
consensus. For each participant, the commitment must have had a highly individual significance, in the light of his condition and belief prior to entering the sect. A brief résumé of the history of that movement at Klamath will illustrate the complexity of the factors surrounding institutional change.

The Indian Shaker movement had its inception on Puget Sound in 1882, but expanded vigorously only after a favorable court ruling a decade later.[12] A messianic faith, it incorporated elements of native belief and practice along with many aspects drawn from Catholic and Protestant Christianity. As it spread, it vied with and was influenced by other syncretic faiths as well as Christian sects, from which its converts and opponents came.

The Klamath church traces its origin to the East End leader, Henry Jackson, who had been instrumental in bringing the Earthlodge cult from northern California. Now, in 1914, forty years later, stricken with what was to prove his last illness, he turned his eyes northward, inspired by what he had heard from the unorganized local converts about the Shakers and their cures. When they declined to treat him themselves—perhaps the fate of the shaman, Dr. George, was still etched in their minds—he

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 sent a mission to the Yakima reservation in the state of Washing-
*657 ton. The leaders who came down worked over him for some
795 time, but concluded that his case was hopeless; and indeed he
• 177 soon died. Notwithstanding this initial failure, the Shakers be-
178 came firmly established. A tribal member, one Stanley Pedro, offered them his dance hall and, drawing a parallel with the better known movement of Europe and the eastern United States, urged that the movement be named the Annie Lee religion. The church, located on the outskirts of Chiloquin, became a focal point from which influences subsequently fanned out to the Siletz reservation on the Oregon coast and to Smith and Klamath Rivers to the southwest. By the circumstance of its location, it drew members primarily from the Klamath proper of the Lower End.

The church met with no official threat. Gone was the day when an Agent might freely move against a religion of which he disapproved. Wrote the Acting Superintendent mildly in 1917, "They are somewhat fanatical and they indulge in some ceremonies that savor very much of ancient Indian customs but their creed contains some very good things. . . ."[13] He or a successor is said to have sent a member of the Indian police to observe the ceremonies, and the latter recalls that he reported with warm favor on the practices he witnessed.[14]

Several features are significant in the establishment of the church at Klamath. It came from other Indian groups along the Columbia which had previously been cultural donors, although the earlier cults received had come rather from the south. As adopted, the Shaker religion was seen as an Indian faith, its syncretism not acknowledged. Proponents thereafter came to underscore the uniqueness of its development by denying that native shamanistic elements or specifically Christian features lay at its core. At the same time, the freedom for inspired expression led converts at Klamath further to modify the received doctrine.
[953) Illness brought on through the agency of ghosts and the receipt of power through songs are but two such reinterpretations. Klamath communicants likewise differed in not eschewing coffee, normally forbidden in other congregations.

The growth did not take place in a vacuum. Such Pentecostal faiths as the Four Square Gospel were on the move soon after the church had come into being. In 1926, missionaries of that

sect were permitted to make temporary use of the Shaker church 648*
building until their own structure could be erected. Tribal mem- 657*
bers were drawn into entrant fundamentalist sects as well as the 795
Shaker faith, and on the occasion of revivals Shakers freely 177 •
visited their services. 178

Together with some of those sects, the Shaker faith embodied [787] many of the demonstrative acts, in dramatized testimonial, visions, and the inspired state known as "the shakes," which had been largely abandoned by other churches that had become more staid with the passage of time. Its cures were the most spectacular demonstration of its power, and many of its converts came to it in this way. At the same time, it drew no very large membership: in 1925, Spier found only twenty Klamath thus affiliated. Any claim to the exclusive allegiance of members—an aspect of the Christian heritage—made heavy way against the broad tolerance in things religious characteristic of the Klamath.

The member of the Indian police who had found favorably for the Shakers was cured by them on another occasion, rang bells in the services, and even sparked a drive to improve the appearance of the church. With equal concern, he contributed heavily to the Four Square Gospel mission, which he felt was beneficial to the "coming generation." His formal affiliation continued with the Methodist Church, and he was often in attendance at the Williamson River Mission. Nor did commitment to Christianity dim his evident belief in the validity of aboriginal Klamath religion. In his mind, and the minds of many other elderly Klamath, there was no need to select narrowly and exclusively a single revelation of the divine order on earth.

The fundamentalist churches—the "emotional" churches, as 648*
they were disparagingly dubbed by some white Methodists in 657*
Chiloquin—appealed primarily to whites and ethnic minorities of 795
lower social status, and indeed participation in their services 563
was a factor weighed in status evaluation. Accordingly, these 177
sects brought tribal communicants into intimate contact with those components of the community, providing the basis for a certain degree of acculturation as well as of intermarriage. A few of the Mexican Interethnic unions stemmed from these associations, and at least one white Interethnic couple was regularly affiliated with the Negro church.

The Shaker church, however, was an ethnic church of some

*648 rigidity, and while its members freely attended the services of
*657 other sects, they were selective in admitting non-Klamath to their
795 worship. It was finally upon the issue of its Indian character that
177 the church was riven. The immediate circumstance was the effort
[563] of the "Annie Lee" faction to introduce the Bible into the ritual.
*648 A stout minority of the members refused to allow this, observing,
*657 in the words of one member, "The Indian has his religion: God
795 speaks to him through the 'shakes.' The white man hasn't got
578 them; he has to use the Bible." The contest soon came to litiga-
177 tion, during which the conservatives held services in private dwellings, while their rivals occupied the church building. Some years later, while the issue dragged on, a fire destroyed the structure; but the "Annie Lee" faction possessed sufficient vigor to rebuild it. Increasingly, that group had been gravitating toward the Four Square Gospel; and when the church was rebuilt it came to be used jointly with another fundamentalist sect.

*648 Thus, even the maintenance of an "Indian" religion, objectively
*657 syncretic in form and content, is sought by a state charter of
795 incorporation and internal disputes are placed before the courts
177 for decision. Moreover, its growth parallels the revivalistic move-
[692] ment of fundamentalist sects upon the West Coast; it vies with them for members; and its destiny is finally interwoven with theirs. Any theory that sees in the growth of such a religion a reaction of the Klamath people to pressures of the time must consider that special history and account for the parallel growth of other sects among non-Klamath at about the same time. For the Klamath, those sects must be regarded alternant to the Shaker faith in providing opportunities for expression. In assessing the features that attracted converts, the appeal of familiar Christian practice, known from earlier Methodist services, must be reckoned, as well as those features which were strictly aboriginal. For some, indeed, the identity of the church as Indian may have been compelling, as fostering an image of independence from the almost overwhelming presence of American culture.

To evaluate the impact of the Shaker Church from the members involved is hazardous. Although only a handful of individuals became exclusively committed to the Shaker way, its impact extended far beyond their ranks. At the same time, the majority

648*
of tribal members held aloof, while some members were no more 657*
than "Sunday" or "holiday" Shakers, attending services only at 795
wide intervals. 177

That there was no single Klamath response to culture contact 648*
even upon the reservation, must now be abundantly clear. It is 657*
also true that tribal members are not to be found extended along 184
a single continuum of change. No typology satisfactorily pre- 177
serves the mosaiclike pattern of the accommodation they have 178
made. For the course, even of institutional change, is the product, not of the engagement of reified "cultures," but of the countless individual choices expressed before concrete alternatives and projected against past experience. In the successive role-relationships into which they have entered, the biographies of some elderly Klamath suggest that there may well have been for them an inner continuity, not unchanging, which provided in their life-way a reference and a means of self-identification.[15] For many younger tribal members, however, the range of possible identification has become greater, while coercive restraints have weakened; and their selection among behaviors may be so conditioned by factors in the immediate situation as to appear inconsistent from one time to the next. Cultural confusion may well have resulted in their failure to form a stable self-image.

A central characteristic of modern Klamath relationships has 648*
been termed, for want of a happier phrase, "permissive diver- 657*
sity."[16] By this is meant a condition offering the individual a wide 156
latitude of choice among multiple and optional alternatives, per- 177
mitted modes being not only broad in range but diffusely de- 178
limited. Analyses of Klamath myths[17] and of the ethnological record suggest that this state, which corresponds in large measure to the "loose structuring" of Embree,[18] was characteristic of aboriginal Klamath culture, but it may well have been enhanced in reservation times by the breakdown of native agencies of control and by those other developments fostering individualism. The roots of its continuity lie in conditions of child-rearing, already reviewed, as well as in the social transactions of adult life.

The corresponding qualities in the individual are equally clear. For many Klamath, the interpersonal distance is of considerable magnitude, and constitutes a wary, defensive response to the

*648 anticipation of rebuff. It may have as its corollary a diffuse self-
*657 image, since the subject lacks any consistent delineation of his
156 characteristics from the reactions of his fellows. For some, as
• 177 well, there is a sense that a stable reference to self through time
178 is lacking, since each fresh experience tends to define it anew.
For the majority of tribal members observed over a period of time, enduring reference groups in which one could claim membership were limited to such entities as "Klamath Indian." As Clifton has put it:

> Persons as psychologically isolated as the Klamath must work hard at the business of maintaining their position. They cannot be expected to contribute much in the way of specific demands on others (outside of occasional impulsive outbursts), and they value situations where specific demands are not made on them. We seem to be confronted with a human group whose members share a primary orientation toward living which is organized around the need to be left alone to their own devices as individuals.[39]

Permissive diversity has found an expression in the manner in which individuals have fused life-ways out of historically disparate elements. This was particularly striking among the older Klamath, who in their youth had participated actively in traditional Klamath culture. Some, indeed, pointed to the essential similarity of native ethic and of Christianity; but others found no need to justify their choice. Life for them possessed a meaning that was involved less in the cultural source of its elements than in the condition of their combination.

*648 One old friend, then bedridden and since deceased, may serve
*657 to illustrate the point. As a child she had lived in an earth-lodge
159 and witnessed her uncle, the shaman, Alec Wilson, performing
177 his cures. Later, as a young woman, she became ill when dream-
178 ing of a shaman, and recovered only when he had been forced to
156 treat her. The gathering of traditional foods and the weaving of
baskets had been part of her skills. A sweat lodge stood outside her cabin. She spoke Klamath and knew the native myths and songs.

Yet equally, she was a product of the Agency school and had worked at the military post of Fort Klamath. When she married, she wed her husband at the Methodist Mission. Together, they ranched together on Klamath Marsh, and with her daughter and

grandchildren, she was a familiar figure in boomtown Chiloquin. 648*
Cured by the Shakers, she almost joined the church, then changed 657*
her mind. From her bed, she discussed a life-way that was an 159
indissoluble blend of diverse elements integrated by their personal 178
import. When she narrated or discussed a Klamath myth, 177 •
her assimilation of a Christian ethic was evident in the delicate 156
manner in which she skirted obscene passages. In admonishing
her great-grandson, she spoke in the traditional manner, but in
English, the only tongue they shared. The English she spoke, like [191]
that of her boarding-school contemporaries, was likewise syncretic;
for it bore the impress of Klamath sound patterns and grammatical categorization.

Individuals such as she, often happy to escape from the gray 648*
reality of age into nostalgic memory, initially struck the observer 657*
as conservative when contrasted with the young people: the boys 156
in Levis, cowboy boots, and leather jackets, the girls in jeans and 177
plaid shirts, who spoke little or no Klamath, and who loitered 178
in the cafes of Chiloquin hanging on the heavy beat of the jukebox. Yet at most, such folk were old-fashioned, and still retained the tastes and inclinations of long habit. Their commitment was selective. Those who still liked to dig the roots known as ipos did so, not with an aboriginal digging stick, but with the more durable iron counterpart made years ago by the Agency blacksmith; and they traveled to and from the grounds, not on horseback, but in the most modern of automobiles.

If there were tribal members who wanted to have as little as possible to do with whites, they did not thereupon stop speaking English or give up their houses, cars, and radios to accomplish this. They continued to purchase food and other necessary items from white merchants. Indeed, their hostility might find short shrift from another Klamath who commanded more knowledge of the traditional lore and still recounted the old myths to her grandchildren, yet possessed many friends among the whites.

Clearly, there was at Klamath in the latter days of the reserva- 648*
tion no clearly distinguishable category of the "native-oriented," 657*
in the sense of a preferential adherence to the institutions of 177
native life. Deliberate retentions rather served as the diacriticals 178
marking an ethnic nationality.[20] The use of the Klamath language [191]
to signify an Indian estate was one marker. It might be used on

*648 formal occasions in the General Council in a demonstration of
*657 decorative oratory; and there it might also serve a speaker to
• 177 shut out a heckler who knew only English. In such a session, a
178 member in the audience, although fluent in English, might de-
191 mand the services of an interpreter for the purpose of underscoring his Indian status. Similar functions were served when Klamath was spoken in the presence of whites. The ability to shift from one language to another, or from one behavioral modality to another, was akin to the behavior which Polgar has described in the "biculturation" of Fox children.[21]

*648 In the latter days of the reservation, there were few occasions
*657 when tribal members came together for traditional events, and
177 the sessions of the General Council constituted the main remain-
178 ing tribal gathering. Such individuals as our old friend mentioned
623 above had their closest and most continuous relations with chil-
619 dren and grandchildren, who by no means shared their outlook.
571 On the occasional visits of their aged peers, these elders exchanged memories and expressed common concerns which were as much the product of the parallel roles they then performed in their respective families as of the time in which they had grown up.

*648 Such accommodation as there has been to American culture has
*657 not only changed through time with alterations in the state of
177 Klamath and American cultures; but at any single time, Klamath
178 have drawn diversely from what was available. Thus, the small
184 number of families in Chiloquin that have attained a measure of social acceptance by whites of middle or high status have done so by manifesting the appropriate life style. In so doing, unless they are able deftly to shift role-orientations, being now Klamath, now white, they have had to sacrifice close relations with their kin. "Some of my family I never see any more," remarked one such woman, "and I don't want to see them." They often forbade their children to play with undesirable tribal children. Insistence upon household neatness, fastidious emphasis upon personal cleanliness, punctuality, and adherence to self-standards usually accompanied these attitudes.

Inframodal behavior among Klamath in turn has by no means been random in form, but has approximated already established patterns in the dominant culture; often combining them in ways

that seem bizarre. In evading prohibition, as already noted, tribal 648*
members learned successively to operate stills, to patronize and 657*
to serve as bootleggers, and to drink alcoholic extracts. For local 177
roughs, the pug and the cowboy provided glamorous models; 178
and several youths ventured upon the hard trail of the profes- 184
sional boxer. [883]
Although cowboy hats and boots were still worn in the latter days of the reservation, they were giving way among this set to the ducktail haircut and the leather jacket. Drag racing and drinking were pursuits as common among tribal adolescents in Chiloquin as among their peers elsewhere. The intermittent use of marijuana cigarettes and an occasional Pachuco tattoo were evidence of the selective adoption of Inframodal practices.

As a category, the inframodal Klamath were often the immediate descendants of some of the elderly individuals already mentioned, dependent upon them for money once they had squandered their own funds, sometimes residing with them, sometimes "shacking up" in a separate household in a common-law union. They formed but one range of the main body of tribal members, among whom they found associates perhaps as often
as they did among their own sort. They did not habitually asso- [571]
ciate with Inframodal peers among other racial groups, but [573]
characteristically remained in small tribal cliques, of which the [273]
drinking groups were the chief stable expression.[22]

Those tribal members still on the reservation comprised a main body, upon which three lobes might be distinguished: the elders, the Inframodal, and those conformant to American standards. The latter alone had tended to become almost completely cut off from the major body of their fellow tribesmen, save for a few leaders, who had been able to keep the respect of both whites and Klamath. The remainder constituted a single society of strong egalitarian persuasions.

While recognizing that a single criterion must fail as a device 648*
for sorting out categories which are the product of such com- 657*
plexity, a first approximation was attempted in an analysis of the 177
records of a random sample of tribal members in Chiloquin.[23] As 178
sorting criteria, the subjects were first scaled against five some- 184
what overlapping entries involving behavior before the law. Then, 125
working symmetrically from the extremes of the scale, they were

*648 divided into three segments as nearly equal in size as possible.[24]
*657 The symmetrical cuts resulted in a Conformant segment, prevailingly
• 177 law-abiding in record, almost twice as large as the Inframodal
178 category at the other end, which consisted of these
184 persons with the highest record of violations. The Intermediate
125 membership was slightly larger than that of the Conformant.[25]

The characteristics of each of these categories, when contrasted, tend to confirm statements made previously. Members of the Conformant segment were least Indian biologically and included the highest proportion of women. They seem to have come from comparatively smaller families and, with the Intermediate subjects, seem to have received far more adequate parental care than did the Inframodal category. Educational achievements are less distinctive, reflecting the compulsory nature of schooling on the reservation, but again the Inframodal segment lags behind the others in school grade completed. In the measure of engagement in business or ranching and in record of money management, the distinctions are decisive, with the Conformant category far outstripping its fellows and the Inframodal segment at the bottom. Finally, in both the percentage of those married and living with spouse and family as well as in the stability of residence the same order is seen.

In the second part of the study, the thirty Klamath subjects who had given Dr. Clifton responses to the Murray Thematic Apperception Test (TAT)[26] were assigned by judgment to the three segments, the protocols of each category being treated together by a method of analysis previously employed in examining Klamath mythology.[27] When all of the modern TAT segments were combined and contrasted with the myths, the responses were seen to reflect changes which had in fact taken place through time. Thus a trend toward a universalistic outlook
[602] was reflected, along with lessened attention to the ramifications
[594] of kinship, a reduction of the family itself to nuclear form, and
[554] a concurrent diversification of role relationships toward individuals
[571] acting impersonally as employer, policeman, doctor, or teacher. A secularization of life may also be reflected by the scant consideration of religion in the modern protocols.

[571] When the modern TAT segments were compared, the Conformant subjects were seen to place a strong emphasis upon support

given the family by neighbors as well as by the impersonal agents 648*
of society, while making little mention of any kinsmen beyond 657*
the immediate, two-generation family. Members of this category, 177 •
who objectively were least Indian genetically and who mani- 178
fested the highest measure of intermarriage with whites, were 184
the only ones to introduce racial comments in their responses. 125
This may well be taken as evidence of their sensitivity to a [571]
marginal condition. In treating intrafamilial roles, they saw a [829]
strong paternal figure (lacking in the protocols of the other two [593]
segments), but they viewed his authority as one against which
the son repeatedly rebelled. Moreover, contrary to their own
superior record of family stability, members of the Conformant
category envisaged the marital bond as frequently threatened
by feminine interlopers. Here again is an indication that the
Conformant families, like the most acculturated among Vogt's
Navaho veterans,[28] had achieved their condition only at the cost
of gnawing anxiety.

By contrast, both of the remaining TAT segments tended to [602]
stress kinship, for in their protocols a greater reliance is placed
upon grandparents and more remote kinsmen, with correspondingly less dependence upon friends, neighbors, or impersonal
agents. Indeed, the Inframodal subjects tended to view the
latter with suspicion and outright hostility. In neither segment [593]
was the paternal role seen as prominent; and the mother instead
occupied a central position, not disciplining, but strongly supporting her children. Sibling relations, which in the Conformant category had been seen as continuing through life, stood on a lower level among the intermediate subjects, who viewed the bond as existing only in childhood; and were negligible among the Inframodal segment. Similarly, the marital bond appeared to be conceived by Intermediate members as weak, being marked by a succession of casual liaisons, while the Inframodal saw strife between the couple, rather than outside interference, as disrupting the union.

By contrast with Conformant subjects, members of the other
two categories exhibited a far less realistic view of the conditions [829]
making possible achievement, but they did so in different ways. Those of the Intermediate segment seemed to see conformance as a necessary factor for success, although their behavioral record

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 showed them in fact to be deficient here, and they made complex,
*667 conditional statements about it. They seemed uncertain about
• 177 the manner in which a prosperous life was to be achieved. The
178 scofflaw members of the Inframodal category, by contrast, saw
184 accomplishment as the result of individual strengths, rather than
125 of surrogate support. In this, having regard for their family form,
829 they may be regarded as fairly realistic; but attainment for them
often took fantastic forms. One might say that they were content to play with the idea but were unprepared to put it into practice. In their treatment of crime and violence they took a realistic view, as against the Conformant subjects, who also gave it prominence, or the Intermediate category, who seldom discussed it; and they often saw them from the perspective of the violator. Conformant concern with crime and violence, by contrast, was coupled with the view that punishment, often involving remorse as well, was both merited and certain.

*648 Several general comments may be offered. In the first place, the
*657 Conformant subjects stand somewhat apart from members of
177 the other two categories in adherence to standards dominant
178 among whites. A matter of some note is the size of the group.
184 While the size of segments was determined by the purposes of
the study, the impression is strong that a larger proportion of tribal members would seem to be attuned already to values honored in American society than have been accepted by their white peers. Social acceptance, from this point of view, has lagged behind the formation of acceptable attitudes.

There are reasons for this. On the one hand, a number of tribal members approve these attitudes as merely reflecting those of the traditional Klamath. Some of them, despite Conformant behavior, decline to choose white associates if it means giving up ties with Klamath kin and friends. Then, too, among whites the formation of acceptable attitudes and behavior must be accompanied by other qualifications, discussed earlier. Major white stereotypes, as can be seen, have been formed about behavior and attitudes found principally among the minority of Klamath who fall into the Inframodal segment, and these have been extended to characterize tribal members as a whole.

Finally, behavior of Inframodal type is more complex than may appear at first. It was present, in somewhat different form, in

aboriginal Klamath culture; it has assumed some of the aspects 648*
of criminal behavior among whites; and as already noted is 657*
turned against the institutions of the whites and the persons of 177 •
Klamath. If Inframodal individuals are seen as rejecting the 178
ambient culture, they spurn only selected parts of it; and they 184
might have rebelled in similar fashion had they lived in the
native society a century and a half earlier.

There is much that continues to link most tribal members together. The assessment of an earlier paper seems valid.

> An individual may act in a manner that both we and the Klamath define as anti-social. Affected kinfolk may object, but their voice is muted and their efforts frequently null. Yet outside of the group immediately affected, the offender may find ready acceptance and even approval, so long as he has not violated the cultural standards of independence, of indifference to pain, danger, or personal inconvenience, of open-handed liberality, of steadfastness to a friend, and of a shrewd opportunism to others. But because there is now no homogeneous mode of behavior governing relations with members of social groups, and no effective coercive agent, Klamath behavior today probably departs more widely from the mode than it did in aboriginal times.[29] [571]

Thus, in various ways the Klamath have come to be differentially distributed, even within the confines of one small reservation town. Members have become acculturated in behavior and attitude to varying degrees and in divergent directions. Through [563] intermarriage, they have come to manifest a range of biological features, some more acceptable than others to non-Klamath. Finally, they have come to be ranked by whites upon a social gradient, although as a whole they are assigned an inferior position. In turn, historical, cultural, ethnic, and social considerations have led most tribal members to eschew their placement and to maintain a life somewhat apart. A major factor in their sense of separateness is the identity accorded corporate image by the tribal government. The following chapter reviews that institution.

[P.236]

The Tribal Government

*648 FOR NEARLY FIFTY YEARS FOLLOWING ALLOTMENT, THE KLAMATH
*657 tribal government constituted the formal instrument for arriving
619 at common objectives, the ultimate guardian against encroach-
646 ments upon Klamath treaty rights, and the corporate symbol of Indian status. Its form and operations sensitively reflected the interplay of continued efforts by the Bureau of Indian Affairs to mold Indian life and the Indian reaction to those efforts. They gave evidence as well of the diversity of opinion which presently arose among tribal members as to the future in which they wished to live.[1]

[423] Central to the importance of the tribal government was the considerable wealth over which it presided: at the close of allotment, tribal property amounted to over 860,000 acres of land, roughly three-fourths of it in prime timber, owned corporately by some 1,150 members. By contrast, the Umatilla reservation, in the northeast section of the state, in 1908 possessed fewer than 2,000 acres in unallotted tribal lands for a comparable (893) membership.

*648 The principal body of the tribal organization was the General
*657 Council, a successor to those sessions convened on occasion in
646 times past to discuss matters of common concern. Such *ad hoc*
623 councils had formerly been found useful to the federal government for mustering a representative Indian body; but with the development of an executive body, the General Council also emerged as a more regular entity. Like its predecessors, it was
[562] originally composed of all the men of the Tribe; after the pas-
[177] sage of the Nineteenth Amendment, the women were added to their number.

*648 Since the highly rationalized bureaucracy of the government
*657 found the occasional councils too unwieldly to handle the in-
646

While the political strength of a family is seen not only in the 648*
succession of interest but in a propensity for members of a family 657*
to vote *en bloc*, this is far from invariably true. The schism 619
separating Jesse Kirk from his half-brother, Joseph, is one prominent 602
instance—and by no means the only one—to the contrary. [665]
In fact, alignment within the family and extended kin has often [578]
been modified by contending considerations.

Nonetheless, for some leaders the solidarity of family sometimes 648*
took precedence over impartiality in the discharge of office. 657*
One tribal council member is quoted as defending his action 661
favoring certain enrollments by the explanation ". . . that since 602
two children were his niece's children, he felt that it was his duty 619
to guard the interests of his minor relatives."[8] Political leaders, seeking to emphasize the purity of their motives, needed to go no further in justification than to declare that they sought only the welfare of their grandchildren.

Although intermarriage and alternative associations have long 648*
overlaid clear identification with the several peoples who had 657*
entered into the treaty, such affiliations have continued to exert 663
political force, however greatly diminished in recent years. In 621
turn, they related to the two broad communities on the reservation. 619
The Lower End remained predominantly Klamath, while Modoc, Paiute, as well as a number of Klamath and Pit River, comprised the Upper End community some forty miles away.
Even after the closing of the subagency at Yainax, the populations [184]
of Sprague River and Beatty continued to reflect the special character of the eastern reservation.

In turn, the relatively easier access of the Lower End to outside [177]•
influences—a subject already reviewed in discussing modern tribal demography—superimposed the effects of differential acculturation and intermarriage upon the traditional subtribal
allegiances that distinguished the two Ends. Difficulty of travel 648*
along the road from the Agency to Yainax had given rise to the 657*
practice, long maintained, of holding separate councils at each 621
place. Thus at the two Ends there had developed political communities 665
responsive to their own local leaders. Harrison Brown, 619
in 1931, played upon a familiar theme when he recognized in Wade Crawford, a leader from the Lower End ". . . a young man who is not a full-blood, who is trying to stir up trouble, and we

EIGHTEEN

Conclusion

THE ADMINISTRATION OF THE KLAMATH TRIBE UNDER THE PROVISIONS 648*
of the Treaty of 1864 comprised a program of directed change, 657*
paralleling in its general features the relationships of the United 171
States government with diverse other Indian peoples. Because a common policy lay behind the administration of Indian affairs, the history that unfolded at Klamath was similar at many points to developments on other reservations. Since, however, unique characteristics of Klamath culture entered into the equation, and common events were locally mediated, that policy had different effects in execution.

Within the spectrum of American Indian cultures, it was im- 648*
portant that the tribes brought upon the Klamath reservation 657*
were unacquainted with agriculture, but had some knowledge of, 241
and esteem for horse-herding; that while they lacked traditions 233
of large-scale political organization, they placed a premium upon 619
industry and the acquisition of material wealth. These attributes, 181
while by no means unique, were distinctive in their combination; 177
and they gain significance when seen from the perspective of 178
the policy objectives of the government. Similarly, the circumstance that many individuals had already undergone extensive acculturation beyond the Klamath country provided the early Agents with native allies already won over to the prospects of change.

Even the application of a common policy exhibited special 648*
features. Two instances should illustrate the point. The recogni- 657*
tion of the tribal claim to a large domain, together with the [423]
retention of surplus lands after allotment, laid the basis for a [619]
corporate wealth equaled by only a few other reservation peoples. [434]
Later, the rejection of the Indian Reorganization Act during the Collier administration placed the Klamath among a minority of

*648 tribes across the country. The issue was fought employing terms
*657 then common in rural Oregon, which were echoed on the Uma-
*648 tilla reservation, which also rejected the Act. Opponents at both
*657 places contended that the act represented an attempt to impose
171 Communism upon the Indian. Since tribal and personal wealth
at Umatilla was far more modest than at Klamath, the rejection was not so much the act of a reservation plutocracy as a reflection of regional biases present in American society at large.

*648 When this has been said, there remains much, even within the
*657 seemingly unique, at Klamath that transcends the local sphere.
177 The following remarks single out for consideration only one
segment of that history, the period of directed change. Yet it is significant for understanding the period that federal supervision of the Klamath was preceded by a half-century of unguided change, the extent of which was not wholly comprehended by early officials; and that it in its turn was followed by a time in which the administration, while continuing to preside, had once more lost essential control over the subject people. The impact of reservation policy was profoundly modified within that context.

000 Directed change[2] involves the control by a superordinate
people over the behavior of a subject group such that it guides the modification of their behavior in accordance with a plan of superordinate choice. It thus differs from planned change, in which a people modifies its own behavior according to design. Control in the former situation may range from physical coercion, and even the elimination of recalcitrants in the subject society, to the arts of gentle persuasion. All this is directed to the end of rendering the subject people compliant to the measures and goals imposed upon them. The tactic of control may encourage the development of a responsive regulating system within the subordinate society, of whatever nature it may be—political, economic, religious, societal, or a combination of these—in such a way that the guiding group may most efficiently transmit directive pressures to the individual members of the subject population. Vital also is the exclusion of contradictory influences, either from without or from members of the administrative staff.

Strategic concerns govern the choice of goals. Are the subject peoples to be made privy to the grand design, or should they initially be set objectives which, though limited, are soon attain-

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

able? What of the priority to be assigned to goals? Are some 000 achievements the necessary precondition to others? Should different segments of the subject people be directed to the attainment of special goals? At what rate should change occur? These illustrations do no more than sample the field.

No agent of change is an advocate of indiscriminate change. He is interested in encouraging modifications in certain areas, but he may well find that in order to attain his goals he must inhibit change at other places. To this may be added that the peoples subject to directed change may well gauge the desirability of the goals imposed upon them by the degree to which they are also the goals of the surrogate peoples. Too, since in directed change the primary advocates are external to the society of those experiencing it, the instrumentalities by which they intervene may prove irreconcilable, not only with the goals seen by the subject people but even with those they themselves seek to impose.

Thus at Klamath a basic incongruity existed between the indi- 648* vidualization of Klamath society and the coercive means some- 657* times employed to achieve that end. A similar disparity lay be- 177 • tween the ideal of an egalitarian American life and the reality of the hierarchical relationship between Agency staff and the Klamath people.

Here were major sources of stress. Implicit in the program was a period of tutelage marked by asymmetrical relationships. In fact, however, the social system of the reservation bore the marks of a castelike hierarchy,[3] in which informal social relations between Agency staff and the Klamath were exceptional. To be sure, tribal members entered into significant secondary relationships as Agency employees and in work-roles off the reservation; and in later times those ties provided the basis for entering into more intimate relations.

What was baffling was this: The material achievements stressed by the administration—in dress, housing, and economy—were often sought as eagerly by the Klamath, and they gradually came around to sending their children to school and going to church themselves. Yet all of these changes, profound though they were, seemed to bring them no closer to an acceptance as equals. As Seldon Kirk was wont to remark in council,

• 177

> When the White men made a treaty with the Klamath in 1864, they said, "In twenty years you will be just like White men, no difference." But when twenty years went by, no White men. And they said, "Twenty years more." After that time still no White men. It is now nearly ninety years, and I ask you, "When will we be like White men?"

This is not meant to claim that the reservation system had failed of the goals which had originally been set. Children were educated and adults retrained to American ways, and in considerable measure the training took hold. Even the resistance of later days often carried the stamp of considerable sophistication. By the beginning of the twentieth century, however, after a generation of rule, success had so far operated as to make the system too rigid for the will of the subject people. They were now highly diverse in biological character and in experience, were no longer confined to the reservation, and were open to outside influence at every level. The coming of allotments, the realization of property, and the anticipation of citizenship, while improving the Klamath lot, made them at once impatient with the residual restraints.

By this time, the administrative machinery for handling Indians had become formidably complex; yet, beset with the multiple identities of the Indian, the Bureau had failed to distinguish among its charges upon some scale of acculturative competence.[4] The Bureau was bound largely to the polar concepts of the Indian as subject to supervision and the Indian as citizen with rights to the enjoyment of his property. In its dual responsibility as custodian and as teacher, the Bureau has often found the former an easier task.

*648
*657
177
434
[464]

Perhaps the greatest single instance of that preference in action was the decision permitting the commercial cutting of tribal timber. This was a step advocated by influential Klamath and by administrators alike, yet its effects proved disastrous to ranching enterprises then under way. The Klamath did not come forward to take employment in logging and milling. Nonetheless, Agency operations now could take their stand upon the firm index of success afforded by management of the tribal estate—an index to which superior governmental bodies were attuned. The maintenance of a tribal estate in trust, in its turn, perpetuated the ambivalence of the Klamath position, which in this quality recalls

the "dependent domestic nations" of Justice Marshall's famous 648*
decision. Many Klamath, now that they possessed funds to secure 657*
their material desires, lost incentive to strive. Lacking opportunities 177 •
for training in competence except that offered in youth [434]
at school or—peripherally—in tribal government, many proceeded
to demonstrate their unfitness to handle their own affairs. Spicer[5] [171]
has noted how reservations in the Southwest suffered from being isolated economically from the surrounding regions. This was less the case at Klamath: in the timber exploitation, the reservation was all too closely identified with the dominant needs of the Klamath Basin and the West Coast, to say nothing of the nation at large. Instead, the ultimate needs of the Klamath had dropped out of the calculations.

In a recent analysis of the assimilation of minority groups in 000
American society,[6] Gordon identifies with the major society dimensions of integration which he designates as cultural, structural, marital, and identificational. In his view, cultural assimilation in visible externals is likely to take place first, probably in conjunction with entrance into formal, secondary relationships. Not, however, until members pass into those intimate social relationships termed primary with members of the host society have they achieved a crucial stage in assimilation. Thereafter, Gordon assumes that marital, then identificational, assimilation will follow with time.

Klamath may demur that they do not wish to submerge their 648*
identity through assimilation with Americans, but at least they 657*
have long sought parity. At first through their own efforts, then 177
later through their dividends from timber, they have acquired many of the attributes that are to be equated with Gordon's cultural category. Assimilated at this level, they have failed to be received at their own appraisal into the social system. Geertz[7] has postulated a model of change involving a cumulative imbalance between social and cultural dimensions which may have partial applicability here, for the Klamath have felt keenly the lag in admission to social relationships of which cultural properties already acquired form the symbols.

Caught in limbo, the Klamath have reacted in diverse ways, many of them characteristically individual and indirect. Some have evaded the situation by moving from under reservation

*648 surveillance; they have then had to make their peace in another
*657 community. In other instances, measures—for example, early
• 177 sawmills, drought cattle, loan funds—designed by the administration to be instrumental in helping the Indians to attain distant goals of betterment, were diverted by tribal recipients to provide short-range benefits. Such action, present even in early times, became more pronounced as disillusionment set in; and organized forms of opposition were also added. In a formal character, there
[619] was an insistence upon the prerogatives that marked tribal
identity. Hence the highly emotional attachment to treaty rights, in however altered form hunting and fishing may be exploited; to the tribal government, however criticized its incumbents; and to the self-preserving myth of the past.

*648 There is, however, another side to the Klamath reaction which
*657 is to be seen in the anomic aspects of the life of Intermediate and
177 Inframodal segments of those dwelling in Chiloquin—although
182 this behavior was not limited to that city. Within Chiloquin,
184 those persons manifest many of the traits that Leighton terms
156 disintegrative: a high frequency of broken homes, of hostility, crime, and delinquency; weak development of associations, recreation, communication, and leadership.[8] For the community as a whole, their effect is accurately characterized by his term. At the same time, their behavior had acquired such substantial predictability that the city fathers had come to rely upon it in the form of revenues from the municipal tavern and fines and trusty labor, for a considerable portion of the municipal budget. Under these circumstances, one might fairly say that a stabilized cultural pluralism existed.

*648 A situation like this cannot fail to leave psychological marks,
*657 and indeed Clifton,[9] observing that "there is very little evidence
177 to suggest, unequivocally, that guarded restraint was a dominant
156 component of aboriginal character structure," considers that attribute to be largely a reaction to the complex unpredictabilities of the reservation. Indeed, the Klamath reaction has striking
[171] parallels in the "hostile dependence" of the Sioux[10] and the
"valuation group alienation" of the Aleut;[11] and it bears close resemblance to the situation described for the Ojibway by James,[12] who sees the personality traits he analyzes to have their source in the immediate context of white-Ojibway relations.

Those same traits others[13] had held to be conservatively Ojibway; and marking their counterparts among Menominee and other peoples the Spindlers[14] propose to see in them a common survival of psychological characteristics shared widely by American Indians. Underhill,[15] by contrast, accounts for the commonalty by reference, like James, to experience in a shared situation, the reservation.

648* 657* 177 156 171

These differences of interpretation are by no means irreconcilable. The writer would agree with James[16] that "the genesis of the modern Indian self lies in the social processes that constitute reservation life," but he would include among those processes such relationships as may have survived in the peculiar cultural environment furnished by the reservation.[17] Favored in persistence at Klamath have been generalized characteristics, rather than complex and specific traits. They have survived in part because they are inculcated during childhood;[18] and the family, within which child-rearing takes place, is one of the structures that has retained distinctive qualities. They are sustained in the quality of primary relationships and are rooted in the individual, often at an unconscious level.[19] As Spencer observes, "The diffuseness of the social structure may be regarded as a survival from the heritage of the past, while individual activity continues to be couched in essentially aboriginal terms."[20] Reservation existence has provided, however, an ever changing context—albeit somewhat sheltered from the rapidly changing environs—in response to which enduring features have undergone modification.

[114] 648* 657* 156 177 178 [571]

To take the quality of guarded restraint, which Clifton regards as characteristic of the personality configuration of modern Klamath, one can indeed trace continuities with the past. In the myths there are present themes of watchful waiting and the use of subterfuge in dealing with strangers and foes, and a wary reserve in conflict with affinals.[21] In traditional relationships, as Spencer has shown, sub-rosa patterns of aggression characterized "hostility . . . driven underground" by public disapproval.[22] That covert revenge has persisted is evidenced by historic records of several murders, of such acts as the firing of a haystack in 1897, attributed by the victim in part to the perpetrators' "envy of his prosperity . . .";[23] and to modern incidents of the same nature. Today jealousy is frequently attributed to unspecified others,

648* 657* 156 177 178 571 [538]

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 usually Klamath by inference and to be identified only in part
*657 with feuding groups. It may well be that such a projection is an
156 indication in many modern Klamath of an alienation from their
• 177 own membership group. More central to the issue taken here,
178 however, is the probability that under the tensions of reservation
571 life guarded restraint, once restricted to a few role relationships, has become generalized to a much broader range of contexts, while at the same time it has grown to be a pervasive characteristic of Klamath personality.

*648 The modern situation at Klamath, with its measure of human
*657 disengagement, apathy, and generated hostility, may be inter-
156 preted by some as justification for the abolition of the reservation
177 there and as an indictment of reservations everywhere. Such
178 conclusions are likely to be far too sweeping. The Klamath situation was a consequence of a reservation become a holding operation, with a program that had ground to a halt. Ironically, termination of the reservation was founded upon the premise that the Klamath had attained a successful level of integration with their white neighbors. It may not be concluded that problems have automatically been solved by the action taken; nor may it be maintained that other, less drastic steps, if taken in time, might not have proved more effective.

*648 For many Indian peoples reservations are a highly significant
*657 reality, constituting the only familiar homeland, the major con-
171 tinuity with the past, the sole real property, and the principal token of the government's resolution to honor pledges made long ago. At the same time, chosen with an eye to native exploitation or to the needs of the small farm of the nineteenth century, they are often unfitted to support a population by current standards. They thus pose the dilemma embodied in schemes on the one hand for local development and on the other for the relocation of Indian families. Sweeping measures are inappropriate; each reservation merits consideration in its own terms. Yet it would be shortsighted to seek only for material advancement, essential though this is; for, as the Klamath instance shows, unless the program give men hope, they languish even in prosperity.

Modoc NS17

M walked with the cradle on her back, it was bound down with a
K piece of buckskin, and there was in some cases a harder material
304 used in connection with the buckskin, such as a small piece of
854 board, or a piece of willow basketry. These headbands were, of
course, properly padded to prevent actual injury to the child's
head, but the pressure was sufficient and was so adjusted that it
caused a decided flattening of both the front and back of the
M head. The younger generation has not been subjected to this
K cradle treatment and does not show the flattening, but among the
[178] older Klamath and Modoc the flattening is very pronounced.
M K Probably due to the influence of the Shoshonean peoples to the
854 east, the cradle board finds some use among the Lutuami, but the
• 177 woven tule and willow cradles are typical of the region.

M In addition to the various articles of dress mentioned in speaking
K of the uses of tule, the Klamath and Modoc make a belt
291 either from the fiber of the inner bark of certain trees or from
286 human hair. These are worn by the women in every-day dress.
Plate 17, fig. 7, shows one of these belts of fiber.

287 As a brush for dressing the hair the tail of the porcupine is
M used (pl. 22, fig. 2). Usually the longer spines are removed and
K the skin of the tail is then stuffed either with shredded tule or
302 with shredded sage-brush bark. In dressing the hair the brush
237 is drawn through it directly against the points of the spines,
which, as may be seen from the illustration, lie almost flat.

K As before mentioned the Klamath have many vegetable foods
262 in addition to the wokas. Most of these are derived from small
plants, but the pine furnishes one. The inner bark of some of
the species of pine is much esteemed as a food and there is a
[237] special implement used in taking it. This knife-like bone implement
(pl. 22, fig. 5) is used in separating the inner from the
outer bark, and is usually made from a deer rib or from a rib
of one of the other large animals.

SUMMARY.

M The Klamath and Modoc people possess a specialized culture,
K due largely to the extensive use of tule in the making of houses,
285 basketry, and various utensils. The only baskets made of a
harder material are conical burden baskets, triangular sifters, a

Klamath Reservation

Foreword

114 I shall not comment in this Foreword, which Dr. Clifton graciously asked me to write, on the technical qualities of these studies in the Culture and Personality tradition. It is of particular significance to me that this study of personalities should be added to the impressive series on the life history of a people, a series of studies, of a single people, probably unique in anthropology. The prehistory, the ethnography, the ethno-history, the linguistics, the period of white contact on the reservation and its vicissitudes, and the termination of the reservation have all been studied in detail and comprehensively. Dr. Clifton's study, while not a specific part of the series of studies directly relating to the processes involved in implementing the federal legislation terminating the reservation, was closely related to them. From the point of view of those of us who hope that Social Science will provide the information on which public policy is based it would have been fortunate to have used the rich fund of actual and potential information on the Klamath Indians to provide a sound demonstration of the use of scientific knowledge to formulate public policy. The results of the kind of study made by Dr. Clifton added to the other information available would have provided the basic data for a significant demonstration of how wise planning in the use of scientific knowledge might be used to formulate a policy, humane, significant in terms of human values and as an expression of enlightened democratic government. The political arm of the government, however, ignored completely the scientific [177] resources at its disposal. The analysis of personalities so effectively set forth in this study makes it quite clear to all except the most naive that the problems of adjustment which have been so apparent during the period of the Klamath Reservation were not automatically solved by the final act of Termination. But that will be another story.

L.S. Cressman

Eugene, Oregon
June 30, 1961

121 had been founded. There was, for example, no evidence for anything remotely
181 approximating a "Native Oriented" group on the reservation. Moreover, it became
054 apparent that a particular style of personal adjustment was by no means
characteristic of the majority of individuals throughout their life-spans.
So called "Transitional" modes of adjustment, for example, might be used to characterize the confused orientations, the value conflicts, and the disorganized family life of persons early in their life arc, but the same persons frequently settled down to a respectable, stable "Elite Acculturated" mode of existence in middle age. Or this sequence might frequently be reversed.

125 However, the formal sampling approach was jettisoned primarily because of the
123 many refusals among the samples. That such a reaction might reflect important
variables and hence prejudice the reliability of the consequent approach was considered, but it was apparent that the major cause for refusal was the absence of an existing friendship relation between subjects and field-worker (or some influential intermediary). Moreover, an analysis of the status of those who refused indicated that this reaction was neither confined to nor clustered within any identifiable grouping.

125 For these reasons, attention was given to securing what may be called a deliberately
representative sample of the reservation population. The criteria of representativeness included variations in social roles assumed by the subjects (occupation, sex, leadership, and so on), variations in role performance, differences
123 in standards and values, and age differences. When appropriate subjects
were known personally by the Anthropologist, they were approached directly.
If no friendship relation existed, potential subjects were, less frequently, approached through the recommendations and aid of an intermediary, or, finally, a direct effort was made to become acquainted with a suitable subject. In all instances, an existing friend relationship proved the more successful mode of approach. For reasons to be suggested in the next section, there are few Klamath persons whose influence is both high and extensive, and, conversely, few who
123 can easily accept external imposition of controls. Thus intermediaries, whatever
their manifest status, rarely could elicit the cooperation of more than one suitable subject. The result of this effort was a set of Rorschach and Thematic Apperception Test Records, and short life-histories on a sample of fifty four persons, which sample could for the purposes of the research be considered as
128 reasonably representative of the target population. The ten case studies in this
report were selected from the original sample so as to provide as much variety as possible in the limited confines of these pages.

Aside from the problems of obtaining an adequately representative sample, there is another aspect of the field method used in the Klamath study which may be of
123 some interest. In each instance the potential subject was made aware of the intentions
of the field worker and the purposes of testing and interviewing. It
181 will be clear from the next section that the contemporary Klamath are in no relevant
sense "primitive," nor are they an isolated population. Indeed, many
125 subjects were familiar with the "ink-blot" test from television programs, movies,
177 or hearsay information. More generally, the major task, that of identifying
ambiguous stimuli, was associated with the simple game of "seeing faces in the clouds" or figures in rock formations. Further, most Klamath under fifty years of age are sufficiently experienced in the practices of American culture to have some personal familiarity with the "test situation," whether personality, aptitude, vocational, or intelligence. Thus there was a shared basis for this peculiar form of interaction.

Because it is for several reasons considered important, the fact that each 125
Klamath subject was, in general terms, made aware of the intentions of the 123
examiner and the logic of the test procedure should be emphasized. Recently,
Hauck has described a different approach used for research among the Unitah- 125
Ouray Ute, where he modified the usual Rorschach procedure by concealing the 114
purposes of the test beneath a supposedly innocuous "cover story" (Hauck 1955: 10).

This approach to field testing is subject to criticism on several grounds. In 125
the first place, it is somewhat less than ethical to conceal the purposes of a 123
test so as to facilitate cooperation, and then to publish results in line with
original intentions. Occasionally, this approach has been used in culture and (114)
personality research. It entails the assumption of a kind of mechanical meaningfulness
of any responses to projective tests, however administered, and whatever
the test taking attitude of the subject. At a minimum, the subject has the right
of knowing what he is involved in and the privilege of refusing. Secondly,
where clinical methods of interpretation are to be employed, it is essential
that field research using projective tests as closely as possible approximate
the clinical situation. This assumes that the cooperating research subject is
more apt to reveal important aspects of himself if he clearly understands the
intentions of the examiner. Indeed, one purpose of projective testing is to 12
facilitate communication about difficult topics, not to unduly impede it with
artificial barriers.

Another aspect of this issue is that most American Indian populations include 12
some members with higher education, or, like the Klamath, others with some 177
awareness of the "ink-blot" or the "picture" test via spectatorship in the mass (171)
media. Because of this awareness, any subterfuge or concealment of test objectives
may be publically revealed and further distorted. The consequence of this
can only be a confused or negative appraisal of field research and field researchers.
Given the existing wariness and suspicion of many American Indian
populations and their concern with their status as "Guinea Pigs," such an outcome
is not very desirable. Finally, it is quite conceivable that another field
worker might want to pursue similar research in a situation where the purposes
of a test have been concealed. If so, he will have to support the original lie,
either by accepting it or by expanding upon it.

Quite frequently, the success of field research in the area of culture and 12
personality studies turns upon obtaining an adequate sampling of a population
in a very limited period of time. Perhaps, as is suggested by the extensive
sampling of Hallowell and the Spindlers in repeated field sessions, it is the time
factor which is crucial. In terms of the ethics of research, the validity of
results, the richness of materials collected, the possible consequences of
distorting objectives so as to obtain cooperation, and the implications for
future field work, the alternative approach of using a "cover story" to obtain
quick results is not desirable.

The Klamath personality research grew out of Clifton's participation in a larger 114
study of Klamath reservation culture. The initial, unpublished, evaluation
of the test and life history data was intended to improve understanding of the
psychological consequences of acculturation in the Klamath case and to give
additional depth to other studies of styles of Klamath behavior. This first
approximation, although suggestive, did not prove entirely satisfactory, largely
because of too mechanical a utilization of what are, in the trade, called
"standard interpretative hypotheses." In short, the initial report was too
cookbookish. At the same time the possibility of bias had to be considered,

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 175
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common
experience and status as Indian in contrast to White, the contemporary Klamath 101
may be considered as one people. This section consists of a sketch of today's 177
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the 162
reservation's population.

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 13
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological [184]
aspects of these water courses were essential to the aboriginal Klamath economy,
as they are essential to the recreational hunting and fishing of the present [224]
population, White or Klamath. [226]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly 648
White culture. For nearly a century they have maintained multiple loyalties:
to the Agency, which represents the Government, to the Tribe, which was an ar- [829]
tificial construct and has seldom been a viable corporate group, to the local
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet 178
in the same years the Klamath have also acquired and learned much, and it would
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-resi-
dence with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White [181]
men of the Klamath. Instead, there has developed a variant socio-cultural
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been trans- 648
ferred to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not
utilize these resources. These latter homesteads are little more than rural [241]
slums, the scenes of perennial drinking parties. For decades the timber indus-
try has been the mainstay of the local economy, but relatively few Klamath have [511]
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

Most Klamath live in one or another of the several
648 towns and settlements on the reservation, or else they have settled elsewhere,
36 in Portland, Salem, Eugene, in California, in Alaska, in the Midwest, or along
[167] the Atlantic seaboard. In 1955 the Tribe had 2118 members, and of these 40
percent lived away from the reservation (Stern & Swanson 1960). Partly because
[619] of the recent progress of the termination of federal supervision of the reservation,
by this date the percentage of members residing off the reservation has
[161] probably increased. In fact, for years there have been numerous "tribal members"
[619] with no experience whatsoever of reservation life.

648 Throughout the years of White contact inter-marriage and inter-breeding have
144 been frequent. Today, more than 70 percent of the Tribe's members are, genetically,
less than one-half "Indian," and less than one sixth are "full-bloods."
[171] Many are indistinguishable in appearance from their White neighbors, as most are
not easily distinguished in dress and language.

175 The isolation of the early reservation period was soon removed by the influx
177 of White settlers, who at first took up farms and started towns near the fringes
of the reservation. Through inter-marriage and through the consequences of
[361] allotment of land to individual Klamath, many Whites were soon residing within
the reservation's boundaries, either on the lands of a spouse, or on land bought
[423] or leased from tribal members. Another source of change were the ever present
[657] efforts of Agency officials to make over aboriginal ways, and later, the rapid
growth of the lumber industry and the development of full fledged frontier communities
[726] were also important sources of acculturative influences. In quick
succession the Klamath experienced a period of armed conflict (the Modoc War of
[786] 1872-73), a religious revivalistic movement such as that which swept the plains
area, extensive governmental planning and intervention, the allotment of land
[181] in severalty, and a growing participation in the cash economy. Because aboriginal
Klamath values had stressed achieved status for those who worked to accumulate
[556] wealth and property, for some Klamath the early period of contact provided increased
opportunities, and there was a group of men who for a time were effective
[436] entrepreneurs. It was through such personal efforts and through the "easy money"
had from private sales or the leasing of agricultural lands, from pro rata shares
of boundary settlements, and from per capita payments for sales of tribal timber
that the Klamath made the transition to a money economy.

648 The participation in and contribution of the Klamath to the economy of the region
is a significant point of interchange between Klamath and White, and one with
[313] many ramifications. In considerable measure, the local timber industry prospers
[423] or slumps, depending on the allotted cut in the tribal forest. Similarly,
local merchants are somewhat dependent upon the assured income of tribal members,
434 as they are upon the purchases of mill workers, fallers, and cat-skinners.
The major town on the reservation, Chiloquin, obtains the largest share of its
[632] revenue from sales at a municipally owned beer-hall and from the fines and forfeited
[251] bails paid by visitors to the city jail, both of which establishments are
patronized largely by Klamath.

648 In other aspects of community life the participation of Klamath is perhaps best
621 characterized as that of passive spectators. Many Klamath have come to have a
sense of being aliens in the heterogeneous local culture, although there is a
563 small assimilated minority.

[571] Thus Klamath may interact as equals in card rooms and pool hall, and are met
with a stereotyped "friendliness" in interactions in stores and on the street.
However, the great majority live in intimate interdependence separate from the
main currents of White social life. White ethnic exclusiveness is reflected

581 Probably one-third of all Klamath women have
borne at least one child out of wedlock. At the same time, there is considerable
[848] out-marriage, and while Klamath and local White unions are not frequent, numerous
[563] tribal members have married off the reservation, to Whites, to other Indians,
and to other ethnic groups. With regard to common-law marriage, one occasionally
[588] hears a Klamath protest that such an unsanctioned union constitutes "Indian-style" marriage, but all evidence leads to the interpretation that the style
[177] is Twentieth century, not aboriginal.

602 Klamath family relationships are by no means limited to the household group,
but are sometimes extended to other consanguinal and affinal kin. Occasionally
596 there is sufficient integration and stability in these relationships to require
[591] notation of the existence of an extended family, but in all cases the bonds are
[177] extremely loose, and the extended group is rarely a residential unit, which
aboriginal Klamath extended families were. These are, thusly, *de facto* groupings
rather than *de jure*. They arise out of special needs and do not have sufficient
[626] status to involve prescribed behaviors. One of the striking cultural losses
is the organization of the co-residential extended family as an agent of social
control.

602 Generally, all kinship bonds are loose or permissive. Although the organiza-
[594] tion of nuclear families is tighter, frequently these groupings, too, are not
co-residential units. All such kin groups are marked by the absence of obliga-
592 tory responsibilities. Perhaps the household group is best represented as the
nearest collectivity to which an individual may turn when in need, with the
571 loose, extended group standing as the next nearest such collectivity. But there
are other groupings with similar functions, friendship networks, adolescent
peer groups, drinking cliques, and similar bonds in specialized role relationships
with local merchants, some of whom act as bankers, brokers, and bondsmen to
their own clientele.

593 Within the total kin network, perhaps the strongest, the most durable, and the
603 most influential ties are those between siblings, and between grandparents and
grandchildren. In some measure this reflects the structuring of the domestic
593 group. There the influence of the principal male is weak. The husband-
592 father frequently does not work, he may rarely be at home, and he seldom acts
as a disciplinarian. Whether or not there is a male attached to the household
[422] group, the wife-mother is usually the power figure. The character of domestic
relationships is suggested by the fact that several households, admittedly ex-
treme cases, had kitchen shelves which were partitioned off by individual owner-
ship of the foodstuffs each section contained, so much here belonging to Father,
that section being Mother's, and this over here the Son's. Thus even with re-
gard to the canned goods needed for daily meals, there was no family property.
[181] Quite clearly, family organization is marked by extreme individuation.

593 One important antecedent of the character of these family bonds has been the
657 constant flow of per capita payments to all and sundry, to the most stable and
industrious and to the most delinquent. Controls over the expenditure of
434 children's funds by parents has been one important feature of these payments,
which although designed to prevent misuse of funds, have also acted so as to make
children more independent of family authority. Klamath children not only come
to feel that they are economically independent, but they feel that the source
of the funds is inexhaustible, and they flaunt their position in their parent's
faces. Additionally, the frequent absence of a stable male identification
figure within the family circle, a male tied to a job by value and need, has
thrown the burden of domestic responsibility upon Klamath women. This is a
serious source of strain in household groups.

882
155 drop out rate of Klamath adolescents, a slacking of attention, and a decline
156 in test performance and grades.

871 Something of the character of adult Klamath concerns and behaviors has already
been suggested. Many work in only a desultory, disinterested fashion, and it
156 is unusual for a Klamath woman to have a full-time job. Thus self-concepts are
[461] not so closely bound to job or profession as are those of local Whites. In
1953, for example, it was found that 65% of adult Klamath were wholly or partly
434 dependent upon per capita payments for their livelihood. Whereas the reluctance
of Klamath women to take outside work reflects the pressures on them to remain
[462] in the home and the extent of their responsibilities there, it also reflects
the fairly secure economic position resulting from the special benefits of
tribal membership. Aside from the twice-yearly per capita payments, these benefits include the privilege of year round hunting and fishing, medical care, loan
services, tax exemptions on land and privileged employment rights at the Agency.
[464] On the other side of the coin, outside of the Agency, the principal local employers are Whites, and for one reason or another they are very reluctant to hire
tribal members. In historical perspective, the development of tribal income paid
out in the form of per capita payments has paralleled the decline of Klamath
participation in the labor market. The contemporary Klamath do not work so often
nor do they work so steadily as did their parents and grandparents. There are
fewer Klamath loggers now than there were in the past, almost no business men now,
and fewer active ranchers and farmers.

434 In spite of shifting policies and personnel, the influence of the Klamath Agency
657 officials has been one of constant supervision over and intervention into the
affairs of Klamath individuals and groups. The controls over the expenditures
of children's funds was noted, and the same controls are exercised with respect
[241] to those tribal members who have been deemed incompetent. Yet the activities
of stable ranchers and farmers have also been supervised by extension workers,
[654] and efficient, prospering Klamath farmers complain that, with a good price decided
on and a buyer waiting, they have to await the approval of an extension worker.
Thus the adequacy of Klamath individuals is frequently in doubt, whether by experience with a particular tribal member's high style of living, or by policy.
657 At the same time in many ways the Klamath have been protected from responsibility
for their own actions. Payment for debts incurred with local merchants is an
426 example, for the reservation being under federal jurisdiction, goods unpaid for
could not be repossessed, nor could income be garnisheed. As Stern and Swanson
phrase this situation, the Klamath have attained economic security "attended
by supervision."

657 Of course, through constant experience with Agency personnel and policy the
Klamath have learned that bureaucratic restrictions may be evaded or circum-
829 vented, and they have long since acquired knowledge of the appropriate manner
of phrasing a request for funds or services. The Klamath complain of this that
forced contact with the Agency has made liars out of them.

648 In summary, little more than a century of contact has merged the originally
177 distinct Klamath, Modoc, and Paiute, and has altered them physically, culturally,
171 and personally. In spite of a small assimilated minority and a large off-reservation population, the reservation Klamath exhibit a distinct way of life
which is novel if heterogeneous. This Klamath Reservation Culture is the
657 familiar context of everyday experience for contemporary tribal members. Thus
181 it is the source of what stability and security they know. No matter how variant,
or how disorganized this pattern of life may be, it is one whose outlines are
the consequence of the thousands of daily decisions, the many lines of action,

and the modes of behaving through which the Klamath interact with their behavioral 181
milieu. For this reason it is not to be supposed that White exclusionism 657
or Agency policy alone are the significant antecedents of the stable
pluralism of reservation life. For a Klamath to leave the amorphous atmosphere
of his home or the circle of his drinking pals to enter into the unfamiliar and
unprepared-for activities of White life is a source of fear and anxiety.

Thus, however it may seem to the outsider, the existing way of life on the
Klamath reservation offers substantial predictability to tribal members, a place
to live, a corporate body with which to identify, and multiple stable human
relationships. As a cultural system it may be stable in form although changing
in detail, and therefore this novel set of human relationships is not likely
to quickly disappear. The Klamath today may not be the same persons who were [177]
settled on the reservation a century ago, and aboriginal Klamath, Modoc, and
Paiute cultural attributes may have disappeared, yet they are still self-consciously [171]
Indian. In studies of acculturation, it is frequently argued that groups
like the Klamath are marginal, that is, hung suspended between two cultural 181
worlds. We feel that such a metaphor is both confusing and misleading. It 657
assumes the presence of a reasonably intact cultural alter of aboriginal design
and a unilineal path of acculturation process. As indicated above, the former 121
is not present on the contemporary Klamath reservation. As to the latter, we
argue that the structural consequences of acculturation are many, and a lineal
assimilation process is only one of them. The Klamath situation, we feel, is
that of an unassimilated minority group which is itself very actively engaged in
maintaining its special position and which is subject to multiple external
pressures for maintaining its present boundaries. The Klamath are, therefore,
in a position analogous to religious and racial enclaves. They are a group
distinct from and in some ways opposed to American culture who fit, as it were,
into a special niche in the larger structure of American society. If the term
marginality is to be used with reference to any Klamath individual it can only
refer to his orientation towards conflicting reference groups in the heterogeneous
contemporary community.

Section III. Approach to the Rorschach Protocols

The interpretive approach to the Rorschach protocols was dictated to a large 121
extent by the overall purpose of the investigation. An avowedly inductive 125
and idiographic study requires a broadly clinical, not a narrowly statistical,
analysis of the obtained Rorschach responses. The conclusions reached on the
basis of this kind of research may be considered hypotheses to be tested in
controlled deductive research.

The validity of the Rorschach method for personality exploration is not at issue
in the present study; there are obviously more clear-cut and efficient research
methods available for that purpose. Rather, the test is being utilized as one
means of gaining insights about the adaptive mechanisms of individuals in a
particular sub-group that is undergoing an acculturation process — a case-study
approach. These insights may lead hopefully to theoretical advances in
that area of study called Culture and Personality.

From this statement of the general purpose of the research, several specific 121
methodological decisions follow. It becomes clear immediately that there will
be no comparisons of groups by statistical methods and few statistical tabulations
of group means and standard deviations. There will be no description of
that artificial construct — the modal Klamath personality. On the contrary,

Aunt May: Female, Age 58

Background Data

*159 Like Carrie, Aunt May's social position is marginal to Klamath and White seg-
[156] ments of the community, and she occupies a position of leadership, although
[184] hers is of a more informal variety. She has 8 years of formal education, but
in her words, has been learning all her life. She has been married four times.
[871] Two marriages were broken by the death of a spouse, one by divorce, and the
[586] fourth, to a White wage worker, to whom she has been married 20 years. One of
the tragedies of her life is that she has never been able to conceive, but she
[842] has made up for this biological failing by formal and informal adoptions of
numerous children, four of whom she had for at least for three years, and one,
[597] an adolescent boy, since birth.

Unlike many of the other subjects, Aunt May is a town girl, although she has
spent some time on a ranch in her youth and would now prefer to live in the
[756] country. When she was young she seriously considered becoming a Shaman, and was
closely identified with one of the surviving "Indian Doctors," but she became
dissatisfied with the prospects of this role. Yet she remained ambitious and
[874] wanted something more for her life than the "other Indians" were getting. She
took up with a white woman who put her to work and trained her as a seamstress.
[759] She became an accomplished mid-wife and frequently will answer to the query if
she knows a certain party, "Do I know him? Why, I cut his umbilical cord with
[857] a pair of my nail scissors." When a small girl she held the role of a "child
nurse" and more or less raised the remainder of her siblings. In recent years
*159 she was literally dragged from her home by a group of white ladies who wanted
156 her to attend their church, a church, which as a girl, on Sunday mornings she
had stood outside, wishing she could enter. She is the social center of gravity
•177 for two large but separate circles of Klamath and Whites. She is one of the
184 few Klamath women with whom elite White ladies will associate, and with them
her position is so esteemed and secure that an invitation to her house is highly
[794] valued. For her Klamath friends, relatives, and "pick-up" relatives (i.e., per-
[608] sons she has taken to her bosom as her own flesh) she is a confidant, an ad-
visor, and an out-spoken critic. She is out-spokenly critical of many patterns
*159 of contemporary Klamath life, particularly excessive drinking and disordered
156 family life. "When I was a young woman I just stopped drinking. It was making
a mess of my life. I didn't want to be a wet blanket, though. I still went to
[273] dances and all. What happened was that I told the boys that I had broken my
glass." Aunt May's home today is one built with her share of tribal income,
[353] spotlessly clean, well furnished and homey. Every room of the house has its
walls and corners covered with mementos and souvenirs, each of which is asso-
ciated with a treasured memory of a particular person and association. It is
noteworthy that these memories are her personal property and do not include her
[571] husband or adopted son. Most of her current social contacts are with Whites,
for although other Klamath visit in her home, she never visits in theirs, be-
cause she does not want to get involved in their arguments.

[157] Aunt May is an extremely assertive woman whose tongue is too often sharp and biting, but every criticism is immediately followed by an effort to soften a person up, reflecting her extreme sensitivity to personal relationships. Perhaps, like Carrie, this strong joking behavior constitutes an appropriate social role. Aunt May is equally sensitive to the reactions of others to her and she will call friends to task for imagined snubs. In public she sits erect and quiet, yet attentive to all that is going on about her, and with great care

Background Data

*159
156 Understandably, it is difficult to find a match for a person like Weasel, particularly in the instance of a woman who occupies a similar status. The few
[593] Klamath women who were like Weasel were not available for testing. Grandma
William's position is that of the mother of a large, disorganized nuclear family
[733] like Weasel's, one marked by excessive drinking, violence, and promiscuity.
[83] She is a vigorous, hearty, earthy old woman who has borne eight children by
three husbands. She is once divorced and twice widowed, her first husband
[587] having died after three years of marriage, her third after thirty-five. She
[871] completed six years of school, all that was available when she was a girl, and
she has lived and visited for extended periods in Washington state, Missouri,
[178] California, and Mexico.

[651] Grandma William's mother was a traditional Klamath wife and mother, and her father
for years an Agency Indian policeman. In her words, both her family of orientation
[464] and her family of procreation have had "bad luck." This bad luck consists of numerous
bouts with the law over acts of violence. Her father died in the Federal
penitentiary where he was serving a life sentence for murder. Several of her
sons have killed men in the past. One is reputed to have killed at least five,
and he is now in a State institution. Her other children are noted for their
violence, and local informants say of Grandma that they cannot understand how
such "a wonderful, good old lady managed to produce so many worthless children."
[577] Few feel that she deserves such a fate. Community acceptance of Grandma Williams
is based upon several attributes, her steady, hard work, her commitment to raising
[177] a family, her devoutly Christian behavior, her espousal of dominant White values,
and, especially, her hearty good humor. She has never accepted the guilt of
either her father or her sons, maintains that they were falsely accused, and
has worked steadily to secure her one son's pardon.

[191] Grandma Williams was raised in a Klamath speaking household and acquired her
English in school. She is very proud of her education and maintains that children
[871] today are not so well tutored in the 3 Rs as she was. She claims that "I
can just about out-spell, out-write, and out-figure all of my kids." This is by
[593] no means the only aggressive, competitive attitude she maintains towards her
children, none of whom have ever quite lived up to her standards. In this respect,
[603] Clifton was once able to witness her training a grandson, who was an alert,
spontaneous, active lad. The boy was made to be too polite and too formal,
[867] behaviors in keeping perhaps with urban middle-class society, but very much out of
place on the reservation. All of her sons have maintained their main affiliations
with the local "cowboy" culture, but they are ridiculed for their efforts at
riding and calf roping because of their obesity and clumsyness, none of them
coming near, in physical type, to the slim hipped, pencil shaped cowboy ideal.
[657] She is an excellent example of a woman who, early in the reservation period, was
carefully tutored by conscientious minister-teachers in inappropriate behaviors
[871] and values, and who has attempted to transmit these to her children. It would
[177] seem that she has produced over-trained, and mis-trained, hostile children, who
promptly discovered that regardless of their veneer of "culture" they were rejected
from many local circles because of their Indianness.

*159 Grandma is a direct, forceful person, another Klamath woman with a sharp wit
157 (yet a less personal one than Aunt May's). She is quick to initiate interchanges
156 and to attempt to knit together a strained situation. Yet her responses

Lily: Female, Age 15

Background Data 159*

Lily is an attractive young high school freshman. She is now repeating her 156
freshman year, due to various difficulties the year before. One of these in-
volved her cursing the principal, for which she was temporarily expelled, to [873]
be returned by her mother the next day. She spent the rest of the year in
silent rebellion. This incident is not too serious, for more than anything [561]
else it indicates the strength of her attachment to a close-knit girls peer-
group which is slightly wild and which makes it a matter of honor to oppose
adults. There is little additional evidence of any serious hostility or re-
belliousness. Lily is the eldest of two children; she has an elder half-sister,
her mother's illegitimate daughter; and she has lived all of her life on the
reservation.

Lily's major activities and concerns are those of a typical, small town teen- [883]
age girl. She attends school, "hangs around" a local teen age center, flirts
with the boys — White and Indian, dances — at her home or the home of a friend,
and listens to records. She comes from one of the most stable families on the
reservation. Her mother is Klamath, a grade school graduate who worked her way [874]
through two years of business school, evenings, in a nearby city. Her mother in
recent years has begun to assume a position of leadership in certain community [571]
activities, particularly recreation and education. Additionally, she has for
long been the advisor for numerous relatives. Her mother verbalizes great fear
and anxiety associated with this "getting out" and has done so only under con-
siderable external pressure. Her father is a California Indian who is the model [177]
of local White conceptions of masculinity. That is, he is vigorous and physi-
cally powerful, a hard, reliable, steady worker in a logging company, a hard [464]
"Saturday Night" style drinker, absolutely fearless, and a masterful fighter
in brawls. His fights are the focus of several local folk anecdotes, and suggest [157]
his excellent reputation, for he protects the underdog, takes on the bully (by
the half-dozen, if necessary), neatly dispatches all and never bears a grudge.

Lily is a more flexible and less submissive person that she would seem on first 159*
acquaintance. The difficulty with knowing her is that she wears a completely 157
impassive, rigid, unexpressive mask before all. One morning after knowing her
for a year the writer walked by her and then stopped, mildly startled, for Lily
had smiled (slightly) and mumbled "Good Morning" under her breath. She is also [123]
less inhibited than this mask of impassivity would suggest, as is evident from
her behavior with her peers and parents, but in all instances she prefers to
communicate with slight gestures and to make do with very few words. She is,
in fact, a remarkably self-possessed, poised, and reserved adolescent girl, a
consequence of which is that she is far more graceful than many other local girls
her own age. But, generally, her responses only minimally involve her with 159*
others. She is always among people, but not always with them. Her reserve does 156
not dissipate much with continued acquaintance, but is a constant feature of her
mode of adjusting to others. She never talks freely and her terse responses to
the blots and TAT cards are paralleled by an equal economy in all personal re-
lationships. There is no evidence to suggest that she is suspicious or distrust-
ful of others, although she can be quite persistent in avoiding people she does
not like.

*159
157 There are no indications of peculiar thinking or intellectual impairment, but the total absence of color responses does reflect a poverty of emotional responsiveness. She appears to be a laconic, taciturn youngster. Her free associations are stated briefly and not spontaneously elaborated.

157 The Rorschach gives us, then, the picture of a stereotyped, overly conventional
156 adjustment. She is a "good" girl who does what she is told and uses her fantasy
to gain the little instinctual gratification she gets. The fact that her smile
[154] comes as she is describing "teenagers dancing" suggests that, like most youngsters
her age, peer relationships are particularly important to her and that this i.
not an area of particular threat. It is probably the male authority figure who
is her difficulty.

*159
156 This protocol contains the first overt comment concerning an acculturation
*177 process. One can perceive her distance from her father in her discussion of
R10: "...it's supposed to get whoever they sing for well." Her objectivity
here indicates that she is a part of the generation which is undergoing accul-
turation. She can apparently look, with distance, at her father's tribe's cus-
[121] toms. One wonders to what extent this cultural change is a factor in her diffi-
cult relations with her father, or whether — with Freud — it's the "universal
Oedipus complex" we see here.

This is a conventional record to the point of constriction: 5 or 6P; F plus per-
cent adequate; several M; no major shocks. Only the absence of color responses
stands out. We are left with the question of how and why this youngster has
[121] buried her feelings so completely? Although this is a brief record, we hazard
the guess that it is the stress of acculturation which has created the over-
control which characterizes this girl's adjustment (R10).

121
156 vague identification and, since it is largely through identification that the
562 super-ego is established, weak super-egos.

593 It has been suggested that what we have called guarded restraint may be a "front"
121 maintained only when Klamath are interacting with whites. The point is that
guarded restraint may be another name for the extreme suspicion and reserve of
156 many enclaved or colonized minority groups vis-a-vis representatives of the
177 dominant culture (Underhill 1960). It cannot be denied that, in fact, reserve
[171] and suspicion do characterize much of the relationship between Klamath and Whites,
but the reserve and restraint which so characterize Klamath persons is not solely
a function of such situations. We agree that guarded restraint is one important
consequence of acculturative contacts, but the evidence of observation and life
histories clearly indicate that this is a personality attribute manifest in many
[829] situations exclusive of the presence of outsiders. Life history subjects, for
example, speak of the "Indianness" of their parents, meaning precisely an aloof,
reserved style of interaction. Many other informants verbalize reactions to the
endemic if latent suspiciousness of Klamath life. Thus guarded restraint is not
purely an observer construct with a referent limited to the test situation. Certainly, a measure of reserve and suspicion may serve utilitarian functions when
interacting with strangers, but the same characteristic makes strangers out of
neighbors.

121 Underhill's suggestion does raise the issue of a broader connection between
156 guarded restraint and the impact of acculturation. If there is such an association then we should expect to find these attributes widely distributed among
177 other acculturated populations, especially those which have been exposed to the
171 imposition of external political and administrative controls, and deculturation
or detribalization. That there may be some validity to this hypothesis is sugges-
157 ted by the fact that attempts to communicate our findings to observers with experience among other acculturated populations frequently evoke memories of similarity in character. What we have called guarded restraint has been suggested as characteristic of the contemporary Southern Ute (Stewart 1961) and especially the Mountain or Towoac Ute (Canan 1961), and of the Cree, Northern Athabascan, and Eskimo (Heinrich 1961). In each instance there are differences, but differences which seem to play upon a common theme.

Personality attributes analogous to what we have called guarded restraint have repeatedly been discerned among other more or less acculturated North American Indian populations. Thus Barnouw describes the Wisconsin Chippewa as emotionally isolated, suspicious of outsiders, and fearful of expressing emotions overtly (Barnouw 1950: 22-23). Klopfer's analysis of Chippewa Rorschachs suggests that "...the individual is under pressure to become as emotionally independent of his environment as possible, and to expect very little from others." (Barnouw 1950: 27). The Ojibwa have been described as emotionally restrained, suspicious, and anxious (Hallowell 1955: 350). Hallowell's interpretation of these characteristics is that they constitute persistent aboriginal components of Ojibwa character structure. In a similar fashion, the Native-Oriented Menomini have been described by Spindler as a group characterized by a non-defensive reduction of emotional display, whose perception is narrowed to only a very selective portion of their environment, and who are further characterized by a non-manipulatory passivity. Outside of the presumed character structure of the Eastern Woodlands, the most widely distributed "aboriginal" characteristics of North American Indians, generally, are given by the Spindlers as non-demonstrative emotionality, great reserve, individual autonomy, and a generalized fear of the world as dangerous (Spindler and Spindler 1957: 148).

On the face of these parallel descriptions it would seem that the Klamath are 121
similar, as regards guarded restraint, to a variety of differently situated, 156
differentially acculturated North American Indian populations, populations with 157
diverse cultural heritages. These similarities are, of course, susceptible to
different explanations. It would be a simple matter, for example, to explain 171
away the similarities as false, that is, as being a function of unreliable tech-
niques of assessment and highly ambiguous descriptive constructs or constructs 177
lacking in validity. Aside from being no explanation at all, this approach would [114]
involve discarding most of the available cross-cultural psychological data as
well as existing assessments of the personality dynamics of North American Indians.
Although this is the course advocated by many methodological puritans in the area
of culture and personality research we choose to accept the similarities as valid.

A second way of explaining these similarities might invoke the assumption of an underlying "North American Indian" character structure or basic personality analogous to Devereux's delineation of a core personality type for the Plains (Devereux 1951). Accepting this assumption the persistence of core traits must then somehow be accounted for. In the instance of the Plains, Devereux presents one possibility, namely that acculturation has resulted in a "stripped-down" and impoverished personality type (Devereux 1951: 25). Somewhat differently, Hallowell and his followers have argued that basic personality somehow manages to weather the vicissitudes of history and acculturation (Hallowell 1955: 309; Spindler 1955: 151). The common feature of both of these explanations is the [114]
assumption of an underlying, basic set of psychological characteristics linked to aboriginal prototypes and common to the population occupying a given culture area.

In the instance of the Klamath there is very little evidence to suggest, un- 121
equivocally, that guarded restraint was a dominant component of aboriginal char- 156
acter structure. The information is scanty and points to the definite presence 157
of great reserve and considerable suspicion, but only as one mode of interper-
sonal relations among others. Moreover, the Klamath reservation situation does 177
not allow a comparison of differentially acculturated groups after the model
used by Hallowell for the Ojibwa, and the effort to apply Spindler's technique [657]
of an internal comparison raised more problems than it resolved in this setting. [171]
Finally, the evidence from the Klamath psychological data indicates that, if
anything, older members of the tribe are less reserved and suspicious. In short,
we cannot assert from available evidence that guarded restraint was basic or
dominant in aboriginal Klamath character structure. We suggest that at minimum
this characteristic was present, but that it did not receive the emphasis it
now gets.

Aside from this difficulty, there are a great many conceptual problems associated 121
with the postulation of an underlying, basic trait of guarded restraint for the 156
North American Indians generally. We feel that it is stretching the point to
attempt to account for present similarities among unrelated cultures of such 157
different cultural heritages with a construct so broad. Due to the absence of 171
firm measures of aboriginal character structure this approach to explanation also
involves substantial methodological problems which are not easily resolved.

Instead of explaining contemporary similarities in either of these ways it is 121
possible to view modern Indian populations in the light of common acculturative 156
experiences and their status as dependent wards, as enclaved minority groups,
and as persons who have been promised much but who have attained little. Spindler 157
has suggested that when acculturation conditions permit both a ready identification 171
177

121 156 157 171 177 with the values of the dominant culture and provide access to the institutionalized means of attaining desired goals there will be a successful psychological adaptation to dominant standards, but that when these conditions do not exist then there may be overt change in the content of culture unaccompanied by changes in psychological characteristics (Spindler 1955: 199). In the same way, Hallowell suggests that constant association with powerful external agents, multiple conflicting sources of reward and punishment and the ridicule and invidious comparisons which too frequently accompany acculturation situations may result in extreme feelings of insecurity, personality maladjustment, and what he calls the "frustration of maturity" (Hallowell 1955: 329).

[178] Spindler's dual hypotheses are, of course, not the only alternative consequences of acculturation situations. We feel that between these polarities there are different modes of adaptation open, modes similar to those suggested by Hallowell. We therefore assert, hypothetically, that the defensive, guarded, reserved style of interaction now characteristic of the Klamath is the product of the deterioration and decay of major patterns of aboriginal Klamath culture, a prolonged exposure to and considerable identification with the values and standards of the dominant White society, and the persistent denial of access to the means and instrumentalities necessary to achieve these goals and to live up to the standards. We argue, in this way, that there are a great many similarities between diverse American Indian populations as noted by many observers, that these similarities do not constitute the residue of generic Indian character traits, but that they are a function of a common depressed minority group status within contemporary American society. Our analysis of this is that these components, specifically, the guardedness, the reserve, the suspicion, and the lack of involvement in creative group activity, are very much analogous to what various sociologists speak of as alienation or anomie (Merton 1957: 121-194; Nettler 1957; Seeman 1961).

000 on nature, physically and mentally, than we are. What distinguishes the civilized man from the primitive man of our days and of prehistoric ages is his greater faculty of turning to account the patent and the hidden powers of nature, or the invention of handicrafts, arts, and sciences. In this the savage man lags far behind the man of culture, and although we often have to admire the ingenuity and shrewdness displayed by the American native in his hunting and fishing implements and practices, the art of agriculture, without which there can be no real human culture, has never been pursued to any considerable extent by the Indians living north of the thirtieth parallel of latitude.

512 The climate of their home compels the Máklaks Indians to lead an
157 active and laborious life. Except in the coldest days of winter they are
[147] almost always engaged in some outdoor work, either hunting, fishing, or
cutting wood, gathering vegetal food, or traveling on horseback. Pursuits like these and the pure, bracing air of the highlands render their constitutions hardy and healthy, their minds active, wide awake, and intelligent. They are quick-sighted and quick in their acts, but slow in expressing delight, wonder, astonishment, or disgust at anything they see. Often they do not grasp the meaning of what they observe being done by the white people, and thus appear to us indifferent to many of the highest attainments
177 of modern culture. Children and adults are prone to reject or slow to adopt
[178] the blessings of civilization, because many of these are of no practical use
to a hunting and fishing people, and others are past their understanding.

The first things they generally adopt from the white people are the citizen's dress and handy articles of manufacture, as beads, tobacco, knives, guns, steel traps; also wagons and other vehicles; for when in possession of these last the horses, which they had obtained long before, can be put to better account They are also quick in adopting English baptismal names, sometimes discarding but oftener retaining their descriptive or burlesque nomenclature from the Klamath language. Gradually they adopt also with the money of the white man the elements of arithmetic, and learn to compute days and months according to his calendar. After another lapse of time they introduce some of the white man's laws, discard polygamy and slavery,

177 bury their dead instead of cremating them, and commence to acquire a smattering of English. Indian superstitions, conjurers' practices are not abandoned before the white man's ways have wrought a thorough change in their minds; and a regular school attendance by children can not be expected before this stage of progress has been reached.

157 [721] In his moral aspects the Klamath Indian is more coarse and outspoken than the white man, but in fact he is not better and not worse. He has attacked and enslaved by annual raids the defenseless California Indian simply because he was more aggressive, strong, and cunning than his victim; his family relations would be a disgrace to any cultured people, as would also be the method by which the chiefs rule the community. But the passions are not restrained among savages as they are or ought to be among us, and the force of example exhibited by Indians of other tribes is too strong for them to resist.

121 157 The character of men in the hunter stage depicts itself admirably well in the mythic and legendary stories of both chieftaincies. Low cunning and treacherous disposition manifest themselves side by side with a few traits of magnanimity hardly to be expected of a people formerly merged in a sort of zoolatric fetichism. There is, however, a considerable power of imagination and invention exhibited in these simple stories, and many of the ferocious beasts are sketched in a truly humorous vein.

Man's morals are the product of circumstances, and the white man who judges Indian morals from the Christian standard knows nothing of human nature or of ethnologic science. The moral ideas of every nation differ from those of neighboring peoples, and among us the moral system of every century differs from that of the preceding one. 000 The fact that the Modocs showed themselves more aggressive and murderous towards the white element than the Klamath Lake Indians may thus be explained by the different position of their homes. The latter being more secluded have not molested Americans sensibly, whereas the annals of the Modocs, who lived in an open country, are filled with bloody deeds. They are of a more secretive and churlish disposition, and what Stephen Powers, who saw them shortly after the Modoc war, says of them is, in some respects, true: "On the whole,

175 to be paid only after the ratification of the treaty by the President and the
648 Senate, which did not take place till five years after the conclusion, viz,
657 February 17, 1870. Meanwhile the Indians were always subject to the possibility of being removed from the homes of their ancestors by the stroke of a pen. The bungling composition of the document appears from the fact that a grave mistake was committed by inserting the term "east" instead of *west* (italicized in our text above), and by not mentioning the land grant made to the Oregon Central Military Wagon Road Company before 1864, which, when insisted upon, would, with its twelve-mile limits, take away the best parts of the Reserve, the Sprague River Valley, for instance. At the time when I visited the country, in the autumn of 1877, the Klamath Lake Indians showed much animosity against the settlers establishing themselves within their domain. The company having left many portions of their projected wagon road unfinished, Congress, by act approved March 2, 1889, directed the Attorney-General to cause suits to be brought within six months from that date, in the name of the United States, in the United States Circuit Court for Oregon, to try the questions, among others, of the seasonable and proper completion of said road, and to obtain judgments, which the court was authorized to render, declaring forfeited to the United States all lands lying conterminous with those parts of the road which were not constructed in accordance with the requirements of the granting act. (Cf. on this subject Ex. Doc. 131, House of Representatives, Forty-ninth Congress, first session, and Ex. Doc. 124, Senate, Fiftieth Congress.)

The first representative of the Government, Subagent Lindsey Applegate, erected some buildings at the northwest point of Upper Klamath Lake, called Skohuáshki (abbr. Koháshti); but as early as 1866 he called attention to the fact that the place had no suitable water-power, but that three miles above the little creek at Beetle's Rest was a most excellent motor for driving a saw-mill and a grist-mill, and, being on the edge of the pine woods, was a well-fitted and shady place for the agency buildings. This advice was followed in 1868, two years before the ratification of the
177 treaty. In the same year the old practice of cremating dead bodies was
764 abandoned and inhumation introduced. The grave-yard was established around the ash-pile of cremation, still visible in 1877, and in 1878 a second

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

177 cemetery was inaugurated between the Williamson River and Modoc Point,
764 one mile and a half south of the bridge.

175 President U. S. Grant's peace policy in regard to the Indians was
648 inaugurated by act of Congress dated April 10, 1869. The supervision of
657 the Indian agencies was placed in the hands of the authorities of religious
[797] denominations, a board of commissioners appointed,* and the spiritual interests of that reservation turned over to the Methodist Church.

SCIENTIFIC RESEARCHES ON THESE INDIANS.

114 The study of the ethnography of a tribe usually precedes that of its language; sometimes both are pursued simultaneously, and this is undoubtedly the correct method. In the case of the Mák̲laks, Horatio Hale,† the linguist of Ch. Wilkes's United States Exploring Expedition (1838–1842), and still holding forth as a pioneer in his lines of research, took down a vocabulary from a Klamath Lake Indian whom he met on the Columbia River in 1841. No ethnographic remarks upon the tribe accompany this vocabulary, probably because information obtained from interpreters, who speak the Chinook jargon only, is notoriously unreliable.

Next in time follow the extensive explorations of John Charles Frémont‡ of the interior basin west of the Rocky Mountains and of the Pacific coast from 1843 to 1844, and again from 1845 to 1846, during which the Klamath Lakes and Klamath Marsh were visited and explored. His reports contain graphic sketches of all that was seen and observed by his parties; but scientific accuracy is often wanting, and many countries are described without giving the Indian local names, which are indispensable to identification.

The acquisition of the Pacific coast by the United States (California in 1846, Oregon in 1848) naturally suggested projects of connecting the two oceans by a transcontinental railroad, starting from the Mississippi River and reaching to the Bay of San Francisco. The Central Govern-

† Born in Newport, New Hampshire, in 1817.

‡ Born at Savannah, Georgia, January 21, 1813; candidate for the Presidency of the United States in 1856; died in New York City, July 13, 1890.

000 could not remain unpunished. Brought before a jury at Fort Klamath, Kíntpuash, Chief Skóntchish, Black or Húka Jim, and Boston Charley were condemned to the gallows and hung at the Fort October 3, 1873, while two accessories to the deed—Bántcho and Slŭ'lks (now George Denny)—were condemned to incarceration at Fort Alcatraz, San Francisco Bay.*

Thus ended the long-contested struggle of the little Modoc band against the Oregon and California volunteers and the regular troops of the United States Army. Certainly the heroism and ingenuity displayed by the Modocs would have been worthy of a better cause, and would have passed down to posterity in the brightest colors of patriotism had not the murderous "entreacte" and Canby's death deprived the struggle of its heroic luster. The unworthy termination of this war is well typified by the fact that the skeleton of the Modoc captain is now dangling as an anatomical specimen in the museum of the Surgeon-General's Office, at Washington, District of Columbia.

STATISTICS.

648 From the end of the Modoc war to the present year the condition of
● 177 affairs has not changed much in the Klamath Highlands. The reports of
178 the United States agent repeat the same story of progress towards civiliza-
657 tion every year; but in view of the difficulty of bringing a hunter tribe into the high road of Christian culture and industrial progress we can not attach much credence to such reports so long as they are couched in generalities and do not contain special facts attesting mental improvement by schooling.

648 In agriculture success is possible only in the Sprague River Valley,
657 but pasturing will succeed almost on every spot of the Reservation. The
[241] report of 1888, compared with that of 1880, shows a considerable improve-
[231] ment in this direction. The 2,500 horses and mules counted in 1880 had increased to 4,532 in 1888; the 200 head of cattle to 2,201. In the latter year the number of swine figured 208, of domestic fowl, 1,000. Of the 20,000 tillable acres of land 1,400 were cultivated by the Indians in

* Slŭ'lks was released, and stays now at the Modoc Reservation, Indian Territory, with Scarface Charley and some other warriors of that war.

773 776 to touch the ground. He then stole all the fruits in the garden and went with them to his underground abode.

Then K'múkamtch, who had observed all this from a distance, arrived and knocked at the top of the house. This time it was the man who opened. When asked what had become of the fruits he excused himself by stating that Munatálkni had taken all of them. This put K'múkamtch into such a rage that he threw the woman out of the house and whipped her to death. Then he cut open the eyelids of both, which previously had been fastened together, and the man said: "I can see the sun." K'múkamtch then instructed the man how to make his livelihood by using the bow and arrow, and how to manufacture sinew-strings and obsidian arrow-heads. Upon this he brought the man's sister into life again and both went into the mountains to hunt, for they had nothing to eat. Ever after this K'múkamtch remained angry with them.

This is but the commencement of a long tale designed to show the miraculous growth of the family which sprang from the first man and woman, and their progress in the life-sustaining arts and manufactures. [177] There is no doubt that the above is a singular distortion of the Bible tale concerning Adam and Eve in paradise. The question which remains to be solved is this, whether or not Munatálkni himself is borrowed also from the Jewish story. If he is, then in connection with him we may recall Aíshish, who, according to some Modocs, is nobody else but Jesus Christ, who two thousand years ago passed through Lost River Valley and dug a deep well there which he presented to the Modocs—all this on account of a phonetic similarity between the names Aíshish and Jesus.

The remainder of the story is exactly like what other Oregonian myths relate concerning the origin of mankind and is incontestably of Indian origin. No further mention is made in it of Munatálkni.

SHŪ'KASH OR WHIRLWIND.

773 776 821 Another of the numerous elementary deities is the Whirlwind or Shū'kash. An interesting mythic tale about it, which I have obtained among the Modocs in the Indian Territory, makes of the Shū'kash an engine brought into play from time to time with tremendous effect by the

775 821 The common belief of the Oregonians is that after death the soul travels the path traveled by the sun, which is the westward path; there it joins in the spirit-land (ē'ni) the innumerable souls which have gone the same way before.* If the deceased was a chief, commander, or man of note, his "heart" can be seen going west in the form of a shooting star. The Egyptian belief was that the soul of the dead was following Atum, the sinking sun, to the west; and since then innumerable nations and tribes have adhered to the same belief.

From the Texts obtained from Dave Hill, pp. 129, 130, we learn that other abodes of dead men's spirits are the bodies of living fish. Perhaps Hill learned of this belief among the maritime and river Indians with whom he lived on the Columbia River, where the idea of fish eating corpses could suggest itself more readily than upon the lakes of the Klamath highlands. The *Notes* which I added to these curious texts give all the explanations which it is at present possible to give. It appears from them that such spirits can enter the bodies of "spirit-fish," that one skúks can see another, and that Indians, not white men, sometimes see the skúks, but at the peril of their lives. A distinction is also made between good and bad skúks, the latter being probably those who render the Indian's sleep uncomfortable by unpleasant dreams.

776 821 Some natural phenomena often appear to these Indians in the form of specters or hobgoblins, as clouds, water-spouts, snow-storms, columns of dust, etc Noisily and rapidly they pursue their lonely path, and their gigantic, terrific frames reach up to the skies; whoever meets them unawares is knocked down senseless or killed outright, or must exchange his body for another. Some of these specters look dark on one side and light on the other.

177 775 821 In northern latitudes, where polar lights are frequently visible, they are supposed by the Indians to represent the dance of the dead, and whenever Christianity is introduced among them they identify this beautiful spectacle with the last judgment, when the spirits of the deceased move about in the expectation of the coming Christ.

---

* Cf. Dictionary, sub voce ē'ni and Grammar, Appendix VI, p. 702. The Warm Spring Indians call the spirit-land: ayayáni. See also Texts, p. 174; 11.

m'na snáwädsh, tsúi nî snä'kĕlua; gä'tak lak̲í gî hûk.
his wife, then I remove (him); no longer chief remains he.

NOTES.

[177] **58–62.** The legal practices, regulations, and ordinances given here by a subchief of the Klamath Lake tribe are observed by all the chiefs, and are apparently fashioned after American models. The principle which seems to guide most of the judicial decisions of the chiefs, is given in one (59, 20. 21) of these regulations: "If a chief makes law like white people, that will be right."* This article is composed of three parts:

Part I. List of the chiefs acting as judges on the reservation in 1877.

Part II. Legal customs governing the Klamath Lake people.

Part III. Instances of application of these legal customs; amount of fines, terms of imprisonment, etc. These are the "*novellæ*" of Klamath legislation.

58, 1–3. P'lú, Lilu, and some other headmen mentioned here have signed the treaty of Oct. 14, 1864.

[563] [657] 58, 4. Móatuash. There are only two Pit River *families* living on the whole reservation.

58, 8. Tcháktot belongs to the Yahúskin tribe of Snake Indians. Cf. Ind. Aff. Report 1873, p. 324.

[193] 58, 10 etc. The future tense employed in these behests, regulations and defenses recalls the French future used in an impressive manner instead of the imperative: *tu ne tueras point, tu ne déroberas point.*

58, 10. shlí-uapk shash. The pronoun shash has here almost the force of a reciprocal pronoun, for the meaning of the sentence is: "do not shoot at people of your own tribe." The same is true of sas in palluápk sas, 58, 10; 58, 13 (twice); pálla shash, 61, 14.

[194] 58, 10. ksaggayuapkámsni is pronounced as one word, as the removal of the accent from the syllable -uápk demonstrates; and so in many of the following verbs standing in the future tense. For the sake of clearness, I have preferred to resolve these forms graphically into their component elements.

[192] [193] 58, 11. wátsam, etc. The possessive wátsam stands here instead of the instrumental case watsátka through attraction from wännikísham. Tchíkla here means to ride away on another's horse, the horse being missed by his owner.

---

* Dave Hill introduces himself in the first person as chief; but many of these decisions can be given by the headchief only, not by any of the subchiefs, to whose number Dave Hill belonged. The Modocs at Yáneks claim to observe these regulations; the Snake Indians do not.

*539 58, 15. shetcháktanuapk stands for the more common form: shitcháktanuapk.

622 692 58, 16. nánuktua shéshatuish m'na: "all what your husband has transferred to your parents to obtain your hand"; m'na stands for hishuáksham. Cf. 61, 8.

193 192 59, 7. mish, *you, to you*, is often used in this article for málash, málsh, *ye, to ye*, in allocutions to two or more persons. This is a way of expressing what may be called the "inclusive plural of the second person". This mode of speaking is observed in m's lápuk, 59, 7; lápuk mish, 59, 7. In the same manner 1 stands for ăt, 59, 8: 1 sissók-uapk, if ye whip each other; also 60, 22.

59, 9. 1 mi stands for mish mi.

59, 17. hă k̲úi gí'uapk: if he should fail to do his duty; 59, 19. hă tídsh gí'uapk: if he does his duty well; nanuktuánta: in every respect.

59, 22. í'χaks mí: what you may win by betting on the horses engaged in the race.

60, 2. kä'lish is the objective case of kä'liak, kéliak, "not having", the simple form of which, without -ak, would be kä'li or kä'liu (kä'li hû).

583 60, 11. túma wátch gitk. The horses have, of course, to be transferred to the parents of the bride and not to any of the chiefs.

231 60, 12. wátch. The horses owned by the Klamath Lake and Modoc people are valued from 20 to 25 dollars each; they descend from the hardy, enduring race of Cayuse ponies, and were originally obtained by bartering commodities with the Columbia River Indians at the Dalles, Oregon.

192 193 60, 15. wátch spuni'-uapka; wátch refers to *one* horse only, for the verb spuni', to transfer, is used of one (living) object only; shăwána is: to give *many* objects. "Not even one horse your wife has to give to you, if she leaves you; but if you leave her, you must give her several."

60, 17. láp snawä'dshla. Polygamy was abolished by the headmen of the tribe shortly after the establishment of the reservation, and this ruling was one of the greatest benefits ever conferred upon that tribe by the progress of civilization. But those 177 595 who had several wives then were not compelled to dismiss all but one and so in 1877 two or three men were still polygamists. The irascible and excitable disposition of the Modoc and Klamath females must have produced many chin-music intermezzos with their husbands at the time when polygamy was predominant.

61, 3. K̲á-i mí'sh etc. In this paragraph, in: k̲í'tgik, kάktak, hémkanktgik, gitkik, the terminal k contains the abbreviated gi, which joined to the foregoing nû, n means 193 *I said*. The construction runs as follows: Hû'nk ni gi k̲á-i mish k̲í'tgi; nánuktuanta káktak gi píla m's n hû'nk hémkanktki gi; nä'-ulakt gí'tki 1 snawä'dshash tchí'sh káktak gi píl. K̲á-i etc.

61, 6. tchik. This particle does not mean *if*, but cannot be rendered *here* (and below) with a more appropriate word. It is identical with tchĕk, *then*. A subordinate clause is here expressed by a co-ordinate one. Cf. 61, 9. 10. 12. 62, 4.

192 193 61, 6. któktatska: "we clip their hair in every instance", is the distributive form of któtchka, któtska, occurring in 58, 16.

61, 9. Tsúi etc. This inverted sentence has to be construed as follows: Tsúi tchish nósh híshuaksh wutódshish snawä'dsh m'na pä'n hû'nk snúkp'la, tsúi nä'-ulĕkan etc.

*539 755

Wudoká	hushtsóχa	sha	kíuksas	sálχitnuk	kléksht	húnk	snawédshash.
Struck	(and) killed	they	the conjurer	for being bewitched (and)	having died	this	woman.

627

Tsúi	sa	lúluksla	snawédsh	kíuksam	síuks;	hû'nk	sa	kíuksas	ä'mpēle
And		cremated	the woman	by the conjurer	killed;	him	they	the conjurer	brought back

tchī'shtal,	tsúi	sa	lúluksla	máklaks.
to (his) lodge,	and		cremated (him)	the people.

NOTES.

68, 1 etc. This is a pretty good illustration of the method of doctoring by suction adopted in similar tamánuash cases. Persons sent out to call for the conjurer do not enter his cabin, but loudly halloo outside till he appears; in this instance he is supposed to sing his medicine songs amidst the solitary wilds of the mountain slopes.

192 177 68, 1. mū'ntch-gī'tk. This temporal adverb places the mode of punishment described by the informant among the *ancient* customs of the people. Compared to what is stated here, the trial of Doctor John shows a material modification in the dealings with suspected conjurers, attributable to the influence of the white population.

192 193 68, 1. 10. salχíta is always used in a passive signification, "to be afflicted with the tamánuash spell or bewitching power", which conjurers can send out at will.

68, 1. 2. The words inclosed in quotation marks *anticipate* all that follows up to 68, 10.

68, 2. 8. a-i. This particle has the signification: "undeniably, evidently".

754 68, 5. shû'ta hû'nk. The "working" of a conjurer on a patient's body consists in rubbing, pressing, magnetizing, in blowing on it, and in pouring water over the face or 753 other parts. Sucking out the object which caused the disease is of course the principal operation called for to effect a cure.

68, 5. mû'ns; it is not stated whether this hánshish was a frog, a worm, a small stick, or any such thing; this is immaterial, for the Indian strictly believes that the article was removed from the patient's body and that it caused the disease.

192 68, 6. hántsantking and 68, 8: shúkpaltaking stand for hántchantki ging and shukpalítki ging; cf. shû'kpēli.

192 193 68, 6. hántchipka properly means: "he sucks towards himself"; husatchipgápēle "he throws up again to himself"; viz. into his mouth, so as to be able to take it out with his hands.

68, 7. lútatkish is the conjurer's assistant. His office is to repeat his tunes or speeches before those present in the lodge, to expound or explain his sayings, to start songs and tunes in his stead, and to perform such manipulations as mentioned here.

68, 8. k'lä'ksh, contracted from k'läkápkash, the dead, the deceased; k'lekápkash telshámpka, to be on the point of death.

192 68, 8. tché-ulχa: he rises from his seat on the ground, or on a blanket near the patient's couch, for the purpose of leaving.

756 69, 1. hushtsóχa. The killing of a doctor or doctress by the relatives of the patient who died under his or her treatment was nothing unusual in the Columbia Basin until quite recently. In some tribes the third failure in curing brought certain death on the conjurer, especially when he had received his reward in advance.

to kill, but his own they horses trade off for blankets to bury him in.

NOTES.

This short notice describes a funeral (isha) of the Klamath Lake tribe in the mode as adopted from the Americans not long after the treaty of 1864, when cremation of bodies was abolished. Whatsoever of the ancient customs in disposing of the dead is still observed, the reader will easily gather from the present sketch.

87, 3. tálaka means to go forth and back with the hand; hence to rub with the palm of the hand, to rub paint on, to paint.

87, 5. Hä' nen wä'g'n. In this connection they can also say: hä' nem wä'g'n; and for wátchatka: wátchetka.

87, 11. tánktak, in this connection, is a compound of tánkt and ak, not of tánk and tak: "just at that time."

87, 17. láp kímbaks gasháktchna: they follow the corpse, which is placed on the wagon, in two files *on horseback;* kímbaks is apposition to shashámoks.

88, 1. Nā'sh etc. The appearance of their graveyard (tchpinû) near the Williamson River does not differ much from that of our cemeteries; it lies in the midst of the woods. For titadsχátko see Dictionary.

---

*539 766 [115]

FUNERAL OF WARRIORS.

GIVEN IN THE KLAMATH LAKE DIALECT BY "SERGEANT" MORGAN, AN INDIAN FROM KOHÁSHTI.

[726] [825] Ní'shta hä'ma mû'kash tχû'tχuk: "mák̲laks k̲'lä'k̲!" Tsúi gátpa
All night long screeches the big owl presaging: "people die!" Then come

mák̲laks ktaklí'sh, tsúi shneshnalχō'ta hushtsóχok. Nā's wípka hû ámbotat,
men parflesh-cuirassed, and while burning down lodges murder they. One (man) escaped into the water,

tsúi shtí'ldshna tû' sa-amoksámkshi m'na; gená shtí'ldshnuk. Tsúi gépka
and reported over there at relative's house his; he went (there) to announce. Then came

tumí' mák̲laks wa-u'htákiug; tsúi shenótank gē'kshta túnip hushtsóχ shenó-
many people to disperse (them); and while fighting on one side five were killed in

tankok. Gē'kshta tchkash hushtsóχa túm, nánka géna kä'ktsnuk vû'shuk;
battle. On other side also were killed many, some started to run away from fear;

*539 Hä' i shma-'htcháktak yaínatat, k̲á-i i ûn k̲ésh shlé-etak; hä'-atoks
If you let your shadow fall on the hill, not you ipo will find; but if

[787] i k̲á-i shma-'htcháktak, tû'm i ûn k̲ésh shlé-etak.
you not let your shadow fall, much you ipo will find.

000 Móatuash, k̲'le-ugtkiuápkasht tchíalash Móatuashăm k̲ók̲etat, k̲á-i mhû'

they kill in spring time; the Modocs also assume, sage-hens the fish to swim up stream invite, there-

gisht k̲á-i lúela.
fore not they kill (them).

NOTES.

*539 171 I. What is contained in these short items refers equally to the Klamath Lake and to the Modoc people, although those contained under I. were obtained from various informants belonging to the former chieftaincy.

[192] 133, 2. páka to howl, bark; pák'la to howl repeatedly, to howl for a while; pák-luipka to howl for a while in the distance towards somebody.

[177] [231] 133, 4. 5. The cat and the chicken being but recently introduced among these tribes, this superstition must have been transferred to them from other animals. By inversion, the words tchíkin gû'lu, *the hen*, appear here widely separated from each other.

[192] 133, 6. K̲ú-i tchämlûk has to be resolved into: k̲ú-i tchē mál (for málash) hú'k: "bad then for you this is!" Cruel fights will follow.

133, 7–11. This story is not clearly worded, but we are taught by it how these Indians are conversing among each other with laconic breviloquence. An Indian living in the vicinity has heard the whining of the dog which means death to his owner. He goes there, shoots the man and takes to his heels. A relative of the murdered man comes up and is mistaken by others for the murderer. They deprive him of his wife, his property and his liberty; he becomes a madman on account of the injustice done to him.

[825] 134, 1. 2. The raven (k̲ák̲) is supposed to be a bird of fatal augury, because he was seen devouring the flesh of dead Indians. Compare: General *Note* on page 130.

[202] 134, 4. kíukayunk. They adjust a rag or piece of skin to a pole and stick out that improvised *flag* on the top of the lodge to notify neighbors that they had a dream last night and desire an interpreter for it.

[525] [825] 134, 5. One of the legs of a dead black tmélhak-squirrel is cut off and laid under the gaming-disk or the pá'hla to insure luck to the player.

134, 7–12. Tcháshăsh etc. This is a fragmentary extract of a scurrilous skunk-myth, which I have not been able to obtain in full from my informant, the Modoc chief Johnson, who speaks the Klamath dialect. This myth is well known through the whole of Oregon, for parts of it are embodied in a popular and melodious song of the Mólale tribe, whose ancient home is the country east and southeast of Oregon City and Portland.

134, 7. 8. mák̲laks nánuk is the direct object of hushtsóga; the skunk killed them by his stench.

[201] 134, 9. tû'paks stands for tû'pakshash; túpakship, abbreviated túpaksh, is properly the younger sister, as called by or with reference to an elder brother, while pa-ánip

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

THE LORD'S PRAYER.

I.

*539
782
177

Nálam p'tíshap, kat p'laí tchía: Nánuk nā'd hû'nk mî shéshash kátak
Our father, which on high lives: All of us thy name truly
shtî'nta. Mî húshkanksh gû'ta nā'lsh. Î hû'nk vû'nhuapk génta käílatat,
worship. Thy mind come to us. Thou wilt achieve on this earth,
wákaktak p'laítalknî gi. Shéwan î nálsh gē'n waítash nálam pála-ash
equally as (thou) on high dost. Give thou us this day our bread
nánuk waítashtat. Hä nálsh tuá k̲ó-idshi gíntanuapk, k̲á-i hûn, p'laítalkni,
every on day. If on us anything wicked should stick on, not it, thou on high.
hû'shkank î! húmashtak nā'd k̲á-i hû'shkankuapk, hä kaní nálsh k̲ú-i
mind thou! just as we not would mind it, if somebody us wrong
gî'uapk. K̲á-i nálsh î tuá shutétki k̲ú-idsha, î înúhuashkpak hak nálsh
should do. Not to us thou anything let do wicked, (but) thou keep away only from us
tuá k̲ú-idsha. Húmasht giúg mi né-ulaks, nk̲î'llitk tchî'sh, ktchálshkash
anything wicked. For thine (is) the rule, force also, glory
tchîsh tchúshniak. Húmashtak an hûn gîtk gi!
also forever. Thus I it to be say!

II.

Nálam t'shî'shap, p'laí tchía: Mî shéshash nánuk stínta; mî k̲óχpash
Our father, on high (who) livest: Thy name all revere; thy mind
gáltchui nanukä'nash nā'l. Gitá tchî'sh käíla humashták gi, wákaktoksh
come to every one (of) us. Here too on earth in the same manner be done, just as
p'laí ki. Nálash gēn waítash shápĕle shéwan î. K̲á-i nálash k̲ó-i shû'tä,
on high is done. To us this day bread give thou. Not us wicked render thou,
húmasht nálam mák̲laks-shítko stínta. I huáshgi nálamtant k̲ó-idsha
equally as our men-kindred (we) love. Thou keep off from our bad
steínashtat k̲óχpash; tídsh nálam steínash shútä. Mî tála litchlítchli, mî
(from) heart thoughts; good our heart make thou. Thine alone (is the) power, thy
steínash litchlítchli tchússak, mû'ni lák̲iam steínash. Húmasht toks tídsh.
heart strong (is) perpetually, great of the Lord the heart. Thus (it will be) well.

NOTES.

These versions of the Lord's Prayer are good instances of what can be attained, without using too many circumlocutions, in rendering religious, moral and other abstract ideas in a language deficient in many of them.

[192] For reign and kingdom no words exist, and they had to be rendered by hû'shkanksh, or in Modoc k̲óχpash, "mind", né-ulaks, "rule, law"; sin and forgive were

*539 rendered by "something wicked" and "not to mind"; for "thy will be done" stands
782 "achieve thou". Power and glory become "force, impetuosity" and "radiance", and
177 daily bread: "flour on every day". In the Modoc version, the wording of which is
192 inferior to that of version I, the use of similar expedients will be observed.

193 I. In the Klamath Lake dialect; by Minnie Froben.

139, 6. inúhuashkpak, phonetic inversion for inuhuashkápk' i; see Dictionary.

139, 7. ktchálshkash, from the word ktchálχa, to shine, to be radiant, resplendent.

139, 8. gitk, in an hûn gítk gi, is the verbal intentional gitki.

II. In the Modoc dialect; by the Riddle family.

139, 10. Gitá käfla is equivalent to gĕ'nta käilatat; in humashták gi the verb gi has to be taken in the *passive* sense.

139, 11. k̲ó-i shû'tä: "do not render us wicked." For shútä compare 111, 15. and *Note.*

139, 12. húmasht nálam. Between these words and the preceding ones there is a lacune in the text. mák̲laks-shitko, "our kindred": those who look like ourselves.

139, 13. 14. In mi tála litchlítchli the adjective strong stands for "strength, power", while in mi steínash litchlítchli it is used in its adjective signification. In this language abstract ideas are sometimes rendered by adjectives and by verbal adjectives in -tko.

DIALOGUES

I.

*539 **Tsématk.** Tatá lish sha ksíulakuapk?
When they will dance?

Skă'lag. Pá-ak k̲á-i an sháyuakta! uná a sha ná-asht she-édshtat mat
Not I know! once they so (said), on Saturday
sha nánuk shûkû'lki-uapk kshí'ulχish.
they all will assemble for the dance.

Kápuak. Tátai tchĭ'k sha kshíulakuapk? Plĕ'nkamkshi á? tám hak
Where after all they are going to dance? At Frank's house? perhaps

gi'ta	mák̲laks."
there	a people."

NOTES.

All Mák̲laks admit that K'múkamtch created their country, the earth and the universe, but as to the special process by which he created them they seem to have no definite idea, though they possess a multitude of myths for special creations.

Most of the places mentioned in this item are situated around Upper Klamath Lake. That they are localities inhabited for centuries past, and identified with the history of the tribe is proved by the fact that their naming is ascribed to K'múkamtch. The most noticeable of them are no doubt the three sweat-houses, all of which are of remote antiquity, and were put to use only when families were mourning the loss of one of their members. Two of them are quoted here: Wakáksi or Käilalkshíni spúklish on west side of Lake and Ē-ukalksi, a short distance south of Fort Klamath. The third lies about three miles south of Modoc Point; it is called Ká-ashkshi spúklish.

103
192

142, 1. käíla. About the meaning of this term in creation myths, cf. *Note* 96, 23. In other connections, in the present text, käíla or kä'la means spot, locality.

142, 2. 3. Tulish. To enable the Indians to catch fish at that place, K'múkamtch built for them, as tradition has it, an obstruction resembling a beaver-dam. Cf. nakótk, 143, 1.; gitl for gita hi.

142, 3. 5. Túkua and Koháshti are camping- and fishing-places on the eastern shore of the Lake. At Shuyakē'kish the Indians leap over rocks for amusement.

142, 5. ná-asni, ná'sni stands for ná-asht ni: "thus I".

142, 5. 11. Gúmbat is called Rocky Point by the white population, and lies on the western shore of Upper Klamath Lake. A-usmi is an island of the Lake.

142, 6. Wakáksi or Wáka is named after the tuákish-fowl whose cry is wáka wáka.

765
177

142, 6–10. 12–16. These mourning customs are gradually disappearing at the present time. One reason for this is the progressive assimilation of the tribes to American customs, another is the circumstance, that all of the three ancient sweat-houses are situated outside of the reservation limits.

142, 15. ndánnántak is composed of ndánnanti or ndánnantat ak: "only for three (kinds of relatives)".

193

143, 1. Nákotk is the instrumental case of nákōsh, lumber-dam: "on account of its dam Witlas will be a fish-killing locality." A loon destroyed that dam by forcing its way under it; one of our texts gives this myth. Cf. 132, 1–8 and *Note* to 74, 2.

829

143, 2. 3. Mbû'saks, Smä'k and Kä'katils are names given in contempt or derision of the respective tribes; the latter to Indians living at the Dalles of Columbia River, Smä'k to a tribe living south of that locality. Cf. 103, 2. 3. Mbû'saks is a name for the Snake Indians.

NOTES.

000 **194**; 1–8. These whoops and tunes were sung by Modoc warriors when on the war-path, or after their return in remembrance of their exploits. The whoops were chanted and howled while going round in a circle for one to two hours; even now they are heard on solemn occasions. This uniform performance was, however, interrupted sometimes by feigned attacks on a supposed hostile force lying in ambush or marching past. A scalp-dance tune, beginning with nk̲eíha, is added, also battle cries.

194; 2. The kä' kä' kä' refrain serves as an incidental interruption of the wéaha- and other whoops. They pronounce it almost voicelessly by tapping their hands upon the blown-up mouth or cheeks in a quick measure.

194; 3. The nók̲e nók̲e is sung either as an introduction to the howienā'-whoop, or as a conclusion to it. It is pronounced in a similar manner as the kä' kä', and often accentuated nokē'.

194; 7. This scalp-dance tune is one of the many heard at these dances during the earlier Modoc wars. A peeled tree, sometimes twenty feet high, was planted into the ground, otter and rabbit skins fastened on or near the top, and below them the scalps of the enemies killed in battle. Forming a wide ring around this pole (wálash) the tribe danced, stood or sat on the ground, looking sometimes at solitary dancers, moving and yelling (yä'ka) around the pole, or at others, who tried to shake it, or at fleet horses introduced to run inside of the ring. Circular dances are of course performed by joining hands.

194; 8. These are the war-whoops alluded to in **23**, 15. Cf. ä-oho-û'tchna in Dictionary.

*539 533 **194**; 9 etc. I include under the heading "humming tunes" lively tunes of short, ever returning periods of words whose signification is generally obliterated. Some of them may include archaic words and forms no longer understood by the present

NATIVE MYTH AND MODERN RELIGION AMONG THE KLAMATH INDIANS

By Robert F. Spencer

773 IN A RECENT STUDY[1] of social change among the Klamath Indians
177 of southern Oregon, informants revealed an unformalized synthesis of
178 aboriginal and modern Christian religious beliefs. These involve, among
[179] other ideas, an identification of the Klamath culture hero with personages in
the Christian pantheon such as the God-Father, Jesus, and Satan. This is of
interest since the contemporary Klamath have lost all formalized aspects of
their older culture. The major institutions of the past have fallen by the way
and, in their overt forms at least, have been replaced by those of the encroaching
Anglo-American society. Acculturation is so far along that the observer
[182] can elicit only covert survivals of aboriginal ideas. Although the tone of the
folk culture has been lost by the Klamath, the reservation life, a common
economy, and the wardship status enforced by external governmental agencies
combine to effect a haphazard solidarity in the group. It is hence not surprising
to discover a rephrasing of older values to meet modern situations.
A case in point is the attempt by many tribal members, young and old, to
find continuity in folklore and so to read Christian meaning into aboriginal
myth.

175 Klamath culture of the past was not essentially different in its orientation
177 from that of many western tribes. Because the tribe was geographically marginal
to several culture areas, it is possible to note the composite nature of its
culture and to discern the realignment and reintegration of elements which
[222] it shared with California, the Plateau-Basin, and the Northwest Coast. In
[226] its overall configuration, the native culture differed from that of the adjacent
gathering peoples because the Klamath had settled on the lakes and marshes
[631] of the region and depended on fish and a wild water-lily. Beyond the basic
[621] economic structure, however, one may note the California flavor of the separatistic
[771] hamlets with their loose social and political organization; the weakly
[791] developed (and possibly late) wealth complex, suggestive of the Northwest
and the Oregon coast; and the formalized shamanistic religion which points
to affinities with tribes in the Plateau, California, and elsewhere.[2]

---

[101] [1] This paper is based on data collected during two summer field sessions, 1948 and 1949,
[122] on the Klamath Reservation. Field research was subsidized by grants no. 21 (Reserve Fund,
1947) and no. 1132 (1949) from the American Philosophical Society, Philadelphia, and by
research funds from the Department of Anthropology, University of Minnesota, Minneapolis.

[113] [2] Cf. Leslie Spier, *Klamath Ethnography* (University of California Publications in American Archaeology and Ethnology, 30, Berkeley, 1930), 224-325; Verne F. Ray, *Cultural Relations in the Plateau of Northwestern America* (F. W. Hodge Anniversary Volume, III, Los Angeles,

773 776 [823] Crow's laughter turned the human and animal objects of his wrath into stones,[6] the basalt outcropping which are today pointed out around the Klamath Reservation as evidence for the truth of the old tale. To summarize, while the culture hero was not himself a source of power for men, the forces at his command were essentially the same as those which every Klamath sought in a formalized quest. Although concerned with natural phenomena like winds, heat, and rain, Kemu'kemps was on the whole indifferent to the fate of men. Like other anthropomorphic or zoömorphic culture heroes, he became the theme of many tales, a source of amusement and entertainment in the aboriginal Klamath culture. But even though humor was present in the tales concerning him, he appears to have been regarded as real and with a slight tinge of awe. There is no question of his marked importance in the aboriginal culture.

177 175 [721] To evaluate properly the Klamath culture hero in the modified setting of the contemporary society, attention must be paid to the religious modifications in the group since the inception of culture change through the encroachment of Anglo-American settlers. The Klamath were never drawn into hostilities with the Whites, unlike their linguistic relatives, the Modoc. Contacted sporadically by Europeans from 1825 on, the Klamath were ultimately drawn into a treaty with the United States in 1864. This reflected pioneer movements to the west and the growth of White population in Oregon. [797] An enforced culture change began with the treaty.[7] There was as a result [797] proscription of the shaman's ecstatic curing activities and an intensity of Christian missionization. Other introductions included a new technology, White education in reservation boarding schools, a new status in relation to an established administrative agency, and new concepts of property, society, and political tribe.[8] The result was in some instances chaotic rebellion, a resistance which took the form not so much of open revolt but rather of a half-hearted and often uncomprehending shift to new cultural values and [182] patterns. The effects are observable today in the tacit rejection of governmental administration and external Euro-American social goals, and in the disorganization of society and personality on the reservation.

175 668 Klamath history is well known since the treaty of 1864. Like many western American tribes, the Klamath were ripe for the native messianic movements, the cults which promised a return to the past and implied expulsion of the European oppressor. An example is the Ghost Dance of 1870.[9] Here Christian

---

[825] [6] Gatschet, pt. 1, 131-132. Some informants suggest that the name for Crow or Raven, Ka'ākemps, is the same as Kemu'kemps. This is doubtful, of course. Parenthetically, many modern Klamath insist that there are no snakes in the Williamson River valley because all were turned to stone by Crow's laughter.

[113] [7] Philleo Nash, "The Place of Religious Revivalism in the Formation of the Intercultural Community on Klamath Reservation," in *Social Anthropology of North American Tribes*, ed. Fred Eggan (Chicago, 1937), pp. 385-412.

[113] [9] Leslie Spier, *The Ghost Dance of 1870 among the Klamath of Oregon* (University of Washington Publications in Anthropology, 2: 2, Seattle, 1927), 39-56.

Here Christian
175 elements, like the sign of the cross, were interspersed with native Klamath
668 traits relating to the shamanistic seance and to the aboriginal folklore. The
177 acculturation process also involved modification and integration of Ghost
[578] Dance forms introduced from adjacent tribes.[10] The growth of tribal, rather
than hamlet, factions split the reservation at this time, and there was the
pattern, familiar among other Indians, of chief rivalling shaman and of progressive
against conservative. While the 1870 cult is one abortive attempt
at native cultural revival, the post-contact history of the Klamath is replete
with illustrations of a religiously conceived resistance to the disrupting
pressures from without. Variously listed are the Earthlodge Cult, the Dream
Dance, and several other revivalistic and messianic forms.[11]

175 By about 1900, nativistic movements on the Klamath Reservation had
177 burned themselves out. Tribal life of a half century ago was fraught with
[668] essentially the same problems which dog it today. People entered into economic
competition in the greater society and became nominally Christian (and so
[797] lent Methodist sanctions to social institutions). However, the older values
[791] were only with difficulty accommodated to the new. One or two shamanistic
practitioners survived but others felt that their power was gone. One informant
[533] tells of her uncle, a shaman, saying sadly, "My songs (shaman power)
have left me." Shamanism as an integrating factor in Klamath life and in
that of other Pacific Northwest groups is reflected in another important
771 movement, somewhat different from the frenzied Ghost Dance. This is the
175 Shaker Cult, also a synthesis of native and Christian elements but with
177 longer range objectives. Originating in the north in the 1880's, it diffused
slowly, reaching the Klamath in 1914.[12] Basically Christian in its orienta-
795 tion, the Shaker Cult admits a fundamentalistic Protestant eschatology;
but in its emphasis on a "God is Light" theme, the employment of the cross
as a particularly efficacious holy symbol, the use of bells, and the presence
of curing seances, it assumed a peculiar flavor. Numerous aboriginal elements
[755] also are discernible.[13] Techniques reminiscent of shamanistic curing are employed
(for example, the removing of causes of disease from the sufferer's
body by means suggestive of shamanistic legerdemain), although the Shakers
vigorously disclaim the older shamans, describe their work as of the devil,
178 and insist that the spirit of God effects Shaker cures. But the Shaker Cult,
771 too, although it enjoyed a following on the Klamath Reservation for some
years, is dying. A few older people now meet in each other's homes for services.
795 The Shaker church at Chiloquin, Oregon, is now rarely used, and the younger

---

[10] Spier, 1927, p. 45. The Ghost Dance was evidently introduced from the Northern Paiute. The Klamath held that Kemu'kemps was coming from the south and that the dead were to return. See p. 53.

[113] [11] Nash, 1937, pp. 412-435; cf. Cora DuBois, *The 1870 Ghost Dance* (Anthropological Records, 3: 1, Berkeley, 1939), 130-134.

795
771 reservation residents are not attracted. Like its more dramatic predecessors,
178 the Shaker religion fails as a bulwark against societal disorganization.

[182] The modern Klamath are in the main nominally Christian. Many are
allied with local churches: Protestant groups attract a fair following; some
771 are Roman Catholics; others now and again join the itinerant Pentecostal
795 and Holiness groups. While many Klamath are unquestionably religious in
184 the accepted Christian sense, the church offers a primary social outlet to
[797] those who value group association. Whatever the function of the church on
the reservation today, apparently it has no aboriginal vestiges in its ritual
[571] or organization. It would be impossible to say to what extent tribal members
find a link with the native past in the spiritual curing practices of such bodies
as the Pentecostal Assemblies of God, which, however, clearly make no concessions to aboriginal concepts.

771 It thus seems evident that the overt forms of tribal religion are gone. The
177 Klamath majority is now avowedly Christian even though church affiliation
is not universal. Religious attitudes seem highly diverse. Some individuals,
184 while indifferent to religious tenet, are admittedly attracted by the display
or by social opportunities. Some are devout, others ignore the churches entirely. Still others, whether or not church members, speculate on religious
questions, show considerable introspective preoccupation, or are frankly
curious about native religion and Christianity. Their opinions and attitudes
[755] demonstrate that the aboriginal past is not wholly dead. In this considera-
[757] tion, shamanistic curing may be ruled out, since modern medicine is generally
accepted by the Klamath and, in any case, shamanistic patterns have merged
with the decaying Shaker Cult. Since this is so, the less formalized aspects
of the aboriginal religion survive to intrude now and again into modern conceptualization.

183 The survival of cosmological features may still be observed here and there.
[773] For example, tales of people and animals turned to stone by Crow's laughter
are half-credulously recounted by young and old. A surviving custom or two,
183 reflecting the older world-view, might also be noted. A boy who kills his first
224 deer is well advised not to eat its meat himself. By giving the game away,
he averts failure in his next hunting expedition. Hunting on the reservation
today is a sport, no economic value being attached to it. (Aboriginally too,
the Klamath were so well adapted to their specialized lake-marsh economy
that hunting played a distinctly minor part.) This custom, which may stem
from the emphasis on wealth and generosity, is laughed down today but it is
825 still practised. Another very common belief is that animals can speak Klamath
[197] but not English. A howling coyote is recognized by young and old as a har-
[763] binger of death; the owl says, "'Maklaks, 'maklaks," which "when you hear
it, it means somebody close to you is going to die." The Klamath word means
183 human and refers to the tribe itself. Taboos on the first game of the hunter,
the first wild foods gathered, as well as fear of the owl are widely distributed
among western tribes.

178 But more pertinent here are the modern Klamath views based on the past
which either influence actual behavior or bridge a gap, conceptually, specu-

178 latively, or rationally, between past and present. There is good evidence
that the need for the power quest has not entirely disappeared, while on
the mythological side, notions concerning the culture hero Kemu'kemps often
recur.

787 The aboriginal power quest was highly formalized. Every Klamath, ap-
[881] parently regardless of sex, sought power frequently. While puberty was
usually a starting point for these contacts with the supernatural, the power
[785] obtained could be lost and might be sought again. A series of related concepts
existed: a sense of humility, fasting, a lonesome vigil, purification by sweating,
[533] and other elements encountered among many Indian tribes. The Klamath
emphasized the inspirational song as evidence of the contact, and the word
/ƚuw'i·s/ meant spirit song, spirit power, or the spirit itself, depending on
787 context.[14] With the breakdown of the older culture, missionary activity from
177 without and the consequent imposition of new values, the formalized behavior
[792] associated with the power quest fell away. But because it was highly in-
dividualized and unquestionably was an integrative factor in personality,
it was not wholly abandoned. Probably the nativistic movements, the Shakers,
the Pentecostalists, or the other emotional outlets permitted substitutions.
One cannot gauge how widely persistent is a sense of individual rapport with
the unseen world; certainly it is not discussed at the present time. The
examples cited here are essentially unintentional expressions of older in-
formants. Undoubtedly, these statements are an index to the emotions as-
sociated with the institutionalized aboriginal quest.

A paralytic woman, bedridden, aged about eighty, remarked as follows to me,
782 "Every day I pray to the mountain. I lie here in my bed and I am sick and
776 old and every morning I say to those mountains, I say, 'Bless me, help me.'
823 I pray just like my mother taught me to do. I ask the river to help me. I
774 say, 'River, help me; give me strength.' And I look over to that rock over
787 there and I get help. My mother taught me to pray to rocks and mountains
and to give some food to them before we eat. It's just like in the Bible. I
dream of those mountains at night. They kind of help you when you ask it."
She also recounts a visit to Crater Lake: "When I was young, I went up to
Crater Lake with a woman I knew. She tied my eyes and led my horse, up,
up. Then she said, 'Untie your eyes,' and I nearly fell off the horse. I saw a man
standing on the water far away, just like in the Bible. He scared me so. I
773 don't know who that was, but I like to think of that man now." The in-
formant refers here to the common Klamath myth of water beings, visions of
whom were apparently a significant part of the spirit quest.

Another older male informant gives a similar view of natural phenomena:
"When I was young, I used to hear my grandfather and father talking. They
said to me, 'You rustle around and get power; you pray to the rocks.' I never
did, but once I was sick and I tried it. 'Help me, I am sick,' I said. Oh, it
was good; they kind of made me feel good, them mountains did. Now I'm a
[797] real Christian [a converted Shaker] and I pray to God and Christ. Those
things help you, but maybe it's the Devil that's working against God."

---

[14] Spier, 1930, pp. 94-100.

782 Other informants also give a hint of this attitude. Even where there is
776 sophistication by virtue of education or long-time residence away from the
823 group, one encounters statements like that of a woman, half-Klamath, half-
Caucasian: "Those old Indians had a lot of sense. They kind of felt at home
774 around here and they would get a lift just from talking to the mountains
787 and lakes. It was like praying and it made them feel at peace. When I get up in the morning, I look first over there [at Mt. Pitt] and it makes me feel good too. Not that I pray in the old Indian way; that's just idolatry. But it's like the scenery kind of gets ahold of you even if I been seeing it all my
787 life."

776 A possible indication of this attitude appears in the repeated warnings to
855 children to avoid certain rocks and cliffs. "You might fall down and hurt
823 yourself" is of course quite true; on the other hand, places about which some modern Klamath parents feel particularly uneasy were associated aboriginally with power sources. A strong drive in the past was fear that a child might be
784 harmed through contact with "power." Every effort was made to keep the child away from the shaman, the sweat lodge, the mourning place, and the
841 like. (It may be noted that menstrual blood was placed near the cradled child to negate forces whose mere presence could harm the inexperienced.) These attitudes toward nature and the surrounding natural phenomena, at least as sources of uneasiness, still exist among younger Klamath of today.

773 Also obtainable is evidence on attitudes toward the culture hero. Some
776 offer a rational systematization of beliefs concerning him. Generally, this
● 177 involves some interpretation in the light of Christian reasoning. Kemu'kemps, because of his essentially human characteristics, readily lends himself to identification with the Christian God. The middle-aged woman quoted above, struck by the linguistic parallels, notes: "Those old Indians were really
273 Christians. It's only the liquor around here that makes the unbelief and trouble. Kemu'kemps means the 'Old One'; that's God. He revealed himself to the Indians long before the Americans [sic] came. He had a son, too, 'Ayšiš, that's just like Jesus. He created the world, just like it says in the Bible. If only those old Indians had been able to see it, they were close to God all the time. They lived good upright lives under his guidance. Another word for Kemu'kemps in our language is *Playtul'kni·*; that means the 'One on High,' 'Somebody up there.' That's the name we give God in our language now. It's all the same."

Not all informants are so definite in their syncretism. One elderly woman remarked: "Who is Kemu'kemps? I don't know. Sometimes I think he's God, but sometimes I think he must be Devil. Maybe he was just a story the old Indians made up. But they called him Playtul·kni· and that means God. My grandson asked me, 'Gramma, who's Kemu'kemps?' I say, 'I don't know. Maybe he's like God.' " In another connection she remarked: "I think that Kemu'kemps is Devil. He gets people into trouble; he leads them into temptation. When I was a little girl, they said to me, 'He's no good; don't believe that any more.' But I don't know. I see the icicles and I think of the wind and Kemu'kemps. He made the world and they call him Playtul'kni·. The Devil

773 is Mu·natul'kni· ("The One Below"). They say Kemu'kemps is everywhere
776 and that's like God. I think about that sometimes."

177 Undoubtedly, a confusion arises because of the adoption by missionaries,
[792] years ago, of terms for the Christian God which the Klamath had applied to the culture hero. The overlapping of Christian and native concepts is readily seen and provides a basis for debate and doubt.[15] It may be profitable to note some of the views and to determine how variable present attitudes are. There is scarcely any standardization except a very prevalent view that Kemu'kemps is somehow real.

The statements which follow were made by Klamath in response to the general question: What is Kemu'kemps? One man, aged about seventy-four, remarked to Hiroto Zakoji, University of Oregon: "Kemu'kemps disappears when he wants to. He tells what will happen and it happens exactly. He gives power to the Indian doctors [shamans] and sends them their songs. But I heard in stories that Kemu'kemps does bad things; he does tricks. I think he is mean, too. God in the Bible is mean sometimes, too. In the Bible it says that God is a jealous god. That's in the first Genesis [sic] and the Ten Commandments says that, too . . . . Sometimes I think Kemu'kemps is the Devil himself. There is a place near the dam over near Chiloquin on this side of the river. There is a big rock sticking out over there near a cave. Kemu'kemps tricks people to go there and dance when a girl reaches the age [puberty]. He misleads people. But God sometimes does bad things; he made Adam and Eve, but he also made the apple."

Two older male informants told separately versions of a myth about Kemu'kemps as a trickster. In the tale, the culture hero set what appeared to be venison up on poles. When the people present asked for some, he at once welcomed them to a feast. To their horror, they found that they were eating Kemu'kemps' feces. The hero laughed and disappeared. The remarks of a man, aged sixty-two, are of interest: "Can you imagine him doing a thing like that? I think that's just a disgusting old Indian story. God wouldn't do a thing like that, so Kemu'kemps must be Devil. But God made plagues in Egypt and maybe that's what this was like."

Although some informants conclude that the culture hero is an older revelation of the Christian God, others, as may be seen, are equally convinced that he is allied with or is the Christian Satan. But the ambivalent attitude appears to be most characteristic. H. Zakoji, of the University of Oregon, reports the following statement from a 74-year-old male informant: "I don't know what he is, God or Devil or what he is. According to the Bible, we worship one God. Nobody ever saw God and white people say that. That's what gets me. Kemu'kemps dealt with the Indians only. He must be before Christ came and he must have disappeared when Christ came." In another connection, he said to me: "If Kemu'kemps disappeared when Christ came, then Christ conquered him. They say when Christ died, he conquered sin and the Devil.

---

[113] [15] These statements suggest the views of Father Wilhelm Schmidt and their implications as given in his *High Gods of North America* (Oxford, 1933), especially chap. 8.

773 That's why Kemu'kemps disappeared when Christ came. But then I remember 776 them talking when I was young about how Kemu'kemps was coming back. 177 That was all lies so I guess Kemu'kemps must be the Devil. Still, they say he created all just like God. I don't know how to figure it."

Mention was made above that the culture hero had a son who was born miraculously. The possible relationship between 'Ayšiš and Jesus has caught the fancy of some. A man of seventy comments: "Yes, Kemu'kemps and God are one and the same. There's a story that says how Kemu'kemps saved a woman's baby when she jumped into the fire and that baby was raised as his own son. I don't believe it. God created all living things. He made the Devil, too. I think 'Ayšiš is the Devil because he's always trying to get the best of his father. We old Indians knew about God but we didn't know about our Lord and Saviour, Jesus Christ."

A 56-year-old woman remarked: "Yes, Kemu'kemps is God and he had a son, just like Jesus. 'Ayšiš even dies and comes alive again in the old Indian stories, and that's like the Christians teach. And that Holy Ghost business, that's the power that God gives. The Indians knew about that. That's why you say 'Father, Son, and Holy Ghost.' "

But so concise a syncretism of aboriginal and Christian religious elements [184] is rare. Younger people vary greatly in belief. One man, about thirty-eight, noted: "Kemu'kemps? They told us stories about him when we were kids. They said he's like God. It doesn't matter to me. Maybe he is; they always say how he made everything around here. Maybe he did; things get that way somehow." A 31-year-old woman remarked: "Kemu'kemps stuff is what they tell kids. That's old Indian devil-talk. I don't know nothing about it." And a 16-year-old girl stated: "I've heard my grandmother talk about Kemu'kemps. That's kind of scary stuff like the dead coming back to haunt [823] you. There's a cave up on the Sprague River where they say Kemu'kemps used to live. Maybe he still lives there. Anyway, I wouldn't walk up that road in the dark."

A woman of about fifty-five, when questioned about the religious training [869] she gave the grandchild entrusted to her care, answered: "Children learn about the Bible very fast. I tell my granddaughter the old Bible stories and she likes to hear them. But I steer off of that old Indian stuff. I think we ought to get away from those old Indian superstitions. I'll sure get mad if anybody scares her with stories about those old Indian things like Kemu'kemps."

Her statement sets the tone for the future. The old beliefs are being lost, and although still very general, they stand out most vividly only in the minds of those who were raised in the period of the second Ghost Dance and the analogous revivalistic movements which followed it. While they obtained, during their upbringing, a detailed background of native Klamath mythology, they succeed, according to their own inclinations, in passing on their point of view to their descendants, or they may fail to do so. The attitudes indicated above are individual; no debate about the nature of Kemu'kemps or related [795] concepts has been noted. While the formally organized religious groups, including the Shakers (however dependent on the aboriginal patterns of

8:Spencer E-5 (1948-1949) 1952 NR10 Klamath NR10

723 shamanism and curing), consistently oppose any such conceptual survival,
776 the point does not emerge as a significant controversy.

Thus, despite the decline of Klamath culture, something of the aboriginal
177 world-view persists. If the unformalized aspects of culture have a greater life-
[795] expectancy than the formalized and institutionalized ones, then the point of view reflected in myth, a series of cultural premises, must in some form outlast the setting of the point of view into motion through actual behavior. This has apparently happened among the Klamath. The overt behavioral aspects are gone entirely, but some individuals uneasily attempt to bridge a gap. The mechanisms which produced a Ghost Dance and a Shaker Cult are now merely vestigial but still present.

will be that way too, sometime. (41) All of us will be thus, we will grow old." (42) Thus my old man [father?] told us—often to us in the evening—even in the evening he spoke to [us] thus. (43) In the evening, [as] we were sitting around the fire, in our house.

(44) And he always advised me thus, "Living like that is good," he said. (45) "If you do anything [wrong] like that, then you will never be able to live here—if you would be a trouble-maker—no. (46) Everything would hem you in, evil. (47) And the law would also follow you. (48) They will always catch you," he said. (49) "[You] can never hide from the law today. (50) The white men have brought us the law. (51) So we will do thus—now we follow it, we have with them—divided it recently—since we divided up the country with them—so we will do thus. (52) We will live as they have told us, having laid down the law on this reservation. (53) And they want us to live in this way, as long as we do not do thus, evil. (54) Then they would take us there, and they would put us inside, there where you do not come back out." (55) Thus they told us, long ago. (56) That's as far as [I will tell it]. [177]

Introductory Note to Text 38

The informants for this text were Mrs. Amanda Cowan, Mrs. Pansy Ohles, and Mrs. Cowan's son, Ransome. Mr. Andrew Ortiz, Jr., a young Klamath friend who does not speak the language but who has a great interest in the old ways, was also present.

Mrs. Cowan is reputed to be the oldest living member of the Klamath tribe, and her age was variously reported as 100, 102, and 104. She retains all her faculties, and the day the author's party visited her, she was spry and cheerful and delighted to help the author understand her language.

Mrs. Ohles began the conversation by describing one of Mr. David's myths (Text 13), which she had heard on the author's tape recorder, to Mrs. Cowan. The machine was turned on at this time, and the conversation was left to run more or less freely thereafter. Later, the author asked about various Klamath forms whose meaning he was unsure of, and also about animals and plants, hoping to add to the corpus. Near the end of the session, Mrs. Ohles discussed kinship relationships and [126]

(ca. 1860-1900) NR10 Klamath NR10

INTRODUCTION

The present study is based on information gathered among the Klamath for the University of California during two visits, each for a month, in 1925 and 1926. Klamath material culture was partly known from Barrett's description of his collection made twenty years ago. The immediate need appeared to be a study of their religion and social organization. Gatschet's account of The Klamath Indians published in 1890 contains many data on shamans' songs and allied topics, but it does not provide any systematic notion of their meaning. 114

The Klamath still live in their old home in southern Oregon, but their ancient culture exists only in their memories, save as the older people keep up domestic pursuits. Yet even middle-aged people have a very good knowledge of it. My elderly informants had all participated in the old life in their youth. These were Nancy Phillips, Pat Kane, and Coley Ball, all three about seventy, and Thomas Lang, about fifty-five. With the exception of Mrs. Phillips they gave information in English: in her case (the most valuable material) Mr. Lang and his son Delford acted as interpreters. 131 178 115

The social life of the Klamath is so much a thing of the past that only its formal aspects can now be recovered. An intimate picture is impossible. But to avoid a stilted expression I have written the account in the historical present. The description of material culture and economic life is not complete. It is still partly extant among the Klamath and well worth investigating. 128

In a final section I have attempted to place the Klamath in a setting of western cultures as a whole. This has been difficult because of the lack of comparative data from much of the northwest; further, only a fraction of the published accounts is available to me at this writing (in Norman, Oklahoma).

The phonetic scheme is the simpler system of the Phonetic Transcription of Indian Languages (Smithsonian Misc. Coll., 66, no. 6, 1916), modified as:

ä as in *Allen*, pronounced more like *Ellen*.
ŋ as in *sing*.
ᴇ indefinite, obscure vowel; very short duration.
ḳ very far back.
ṛ cerebral; tongue tip probably turned back as Gatschet states (the sequence kr also occurs).
g̣ cerebral; may be the same sound.

[p. vii]

do keep up their ordinary occupation in part during this time. They 841
dig roots for instance, but others must care for the products further, else the women will never find any more.

There is no comparable rite for boys at puberty. Nevertheless the 881
time when a boy's voice deepens is recognized as propitious for seeking power. He is sent into the mountains for perhaps five days, to wander [787]
at night, running continually, piling up rocks, swimming in the mountain pools and eddies of the rivers, fasting the while until a song comes to him in a dream. He must use a head-scratcher. Preadolescent boys [866]
are tossed into the river or whipped while they sleep. If the boy whimpers he will be a weakling; he is expected to jump up and shout. I have cited above the case of Lᴇle'ks who was so treated at puberty, it seems, and thus lost his transvestite habits.

> When I [Pat Kane] was a little boy of seven or ten, my father sometimes 866
> threw me into the river while I slept. I did not ask why. Finally he told me, 159
> "I do not want to kill you. I do it so that when you are grown you will not easily get sick, so that if you are shot you will recover quickly." I always bathed in the river as a boy and you see that I have never even had rheumatism until recently.

DEATH AND MOURNING

Klamath funereal observances are personal, non-ceremonial, and 764
somewhat unique in that they provide occasions for the seeking of power. There are no mourning anniversaries. [765]

Cremation is the universal practice, even for suicides, the newborn, and the stillborn. Only the bodies of secretly aborted infants are buried in the bush. The body of a man killed in war is brought [727]
home for cremation.[98]

> Some Klamath men were trapping in the mountains west of Crater lake about eighty years ago when they were met by some Upland Takelma who killed four or five. One boy alone escaped and made his way back to Klamath marsh at night. The Takelma took scalps, hands, and feet of the dead, and held a dance. Many Klamath went to fetch the bodies, which they brought to Klamath marsh for incineration.

Near each group of settlements is a spot where all cremations take place. It is somewhat apart from the settlements but not isolated.

> Three of these serve the Klamath marsh people; on the eastern side of the marsh near the towns k'ᴇtaiwas (2, see maps, figs. 1–3), gūpgūa'ksi (3), and l'wal (4). For others of this division of the tribe, there is one on Sprague

---

[98] Cremation was given up forty or more years ago ("in about 1868," Gatschet, 1:86). The first burial was that of a Molala man, married to a Klamath woman, who was killed by a Klamath. [177]
[178]

This is a spirit. Doubtful as spirits are certain other stones; yati'a 776
which stands at I'wal, and nē'ķnūķ, a group of stones back of
Du'"Ilķūt, both towns on Klamath marsh. These are "shaman 776
stones"; evidently once living things, for it was said that they were 756
transformed when Crow laughed at them.

A Molala struck one of the nē'ķnūķ stones with a basket, saying, "How can this rock have power?" He soon sickened and died. The nē'ķnūķ is a shaman.

SHAMANISM

The shaman (ķiu'ks) is one who has acquired more than usual 756
spirit power. This is a relative matter; some shamans have considerably more power than others, and everyone who has got power is in some degree capable of using it as a shaman does. One of my informants, for example, now avowedly a member of the pseudo-Christian Shaker sect, maintains that he too is a little qualified; he can make it rain. Shamanism is completely individualistic among the Klamath; there are no shamanistic organizations.

It is clear that the shaman is the most important individual in 756
Klamath society, taking precedence over rich men, the chiefs. Sha-
mans' houses are the largest in the village and they have at least as 622
much property as wealthy laymen. Invariably my informants spoke first of shamans in describing outstanding individuals. Their behavior and practices were readily formulated, whereas I experienced considerable difficulty in learning the functions and even the names of chiefs.
It is reasonably certain that the status of the chiefs, that is the rich
men, was relatively unimportant until the introduction of horses in [178]
the middle of the last century stimulated trading with the Columbia
river tribes and perhaps brought in some of the northern view of the [177]
importance of wealth and chieftaincy. There is no doubt that the position of chiefs was strengthened by the habit of the whites of dealing with chiefs and other prominent laymen.

Shamans are both men and women, but unlike the Shasta, the 756
majority are men. My informants mentioned many men shamans
during the course of my visits, and this probably did not exhaust 562
their memories; but on request they could muster only four women [171]*
shamans and one berdache. Women never acquire the prestige of men for they are rarely credited with such unusual powers as men. They cannot wander in the mountains nor dive for power so well as men;

two lie in the same vertical plane.[340] The split willow strands are flat and are so placed as to break joints, leaving uncovered sections of the foundation rods exposed between the coil stitches.

K
531
178

In former days hats were the only baskets decorated by the introduction of designs. Today the majority of baskets are twined bowls, intended largely for sale to the whites, to which these decorations have been transferred. Or, one might legitimately say that the modern bowls are degenerate examples of the old hats, since the techniques are practically identical.

K
285
531
386

As to the materials used in decoration, Barrett observes that the "designs are usually worked out in the reddish brown roots of the tule, though the outer leaf skin of a certain jointed rush [*Phragmites?*] which provides a shiny, creamy white material is also used. For the finer baskets the quills of the porcupine, dyed yellow by means of a yellow moss, probably the widely used *Evernia vulpina*, are used,"[341] or more rarely, tule leaf, aged to yellow, according to Merrill. The latter also notes that rarely tule and porcupine quills are dyed a bright pink with the root of an unknown plant.[342] Alder bark (wip'-läm, *Alnus tenuifolia* Nutt.) furnishes an orange dye, according to Coville,[343] which may have been used for basket materials. The bark is peeled from the tree in spring or scraped at other seasons, and boiled in water. Coville also states that tule strands are dyed black, and called mŏk'-wäs. "Ordinarily this is accomplished by immersing the tule stems in the black mud of sluggish springs containing iron. A superior color, however, is obtained by the addition of a quantity of wokas hulls, which contain a large amount of tannin. The same result is now frequently secured by these Indians by prolonged soaking of the tule stems in an iron kettle, in water containing a liberal amount of the hulls."[344]

K
531
[178]

A number of designs placed on bowls and hats were recorded (fig. 17).[345] These bear names, and according to my information, the habit of naming them antedates the whites. Decoration is generically

---

[340] My notes not being altogether clear on this point, they have been corrected by Miss Isabel Kelly.

[341] *Op. cit.*, 254. Coville (Notes, 88) confirms this identification (native name, shwă'-wi-säm) and adds that the quills are obtained from the Modoc, but I see no reason why they should not obtain their own.

[342] P. 221.

[343] Notes, 94.

[344] Wokas, 737; Notes, 92.

[345] These are arranged so that the rim of the basket must be understood to be above the design, that is, in the order of their manufacture. My notes are uncertain whether figure 17i is correctly placed.

343 is gable-shaped, the ridgepole being supported at each end on a pair of struts thrust obliquely into the margin of the pit. Sticks and bark resting on this form the roof; a layer of dry grass and dirt covers the whole. This stands three and a half feet above the ground. The entrance, which is quite small, is covered by a mat (fig. 20).

Stones, heated outside, are rolled into a hollow in the lodge. There does not seem to be any prescribed place for this, as among other peoples. The stones are said to be at the rear in the winter lodge, and anywhere in the summer affair, but in a winter lodge that I saw, the hollow was near the doorway to the right of one entering, and at the back in a summer lodge. For the use of five or ten men, I was [801] told, a large summer lodge has the stones at the center. Five is the Klamath pattern number, but it was said that there was no prescription of the number who may enter at one time, nor of the number of times they sweat. Water is thrown on the hot stones after they are somewhat cooled, otherwise the steam would scald the inmates. There is a certain amount of rivalry on the part of those who have the water to drive the others out by raising steam; sometimes four or five have it at one time.[376]

They talk to the stones when sprinkling them, asking to be cured, to live long, work well, to have luck in gambling, and to get spirits. This is the same as talking to the water when swimming on a vision quest. "The stones are 'doctor'; the water is 'doctor.'" They talk to [562] the wind, the mountains, the water. Everyone outside is quiet. Men and women go into these lodges together.

Coville observes that "the branches and twigs of the 'cedar,' (*Librocedrus decurrens* Torr.) are often used in administering a sweat bath to a sick person."[377]

343 The three sweat-lodges used solely by mourners closely resemble the "winter" lodge. In fact, the lodge just north of Klamath Agency does not differ in any respect. I have seen but one of the other two, that near Algoma. This is now a U-shaped wall of stones which once bore a rough gable roof covered with dirt. It is much larger than the [178] winter lodge, enclosing an area ten by twenty feet.[378] It may be suggested that conservatism has preserved the type for this use, while for secular uses it has been, or is being, supplanted by the dome-shaped lodge.

---

[376] For a tale describing such rivalry, see p. 37.

[377] Notes, 88.

[378] For its description and use, see pp. 73 f.

K
This is undoubtedly true equally of all the tribes lying in the Columbia 262
drainage from the Rockies to the Cascades. It is known to be so of
tribes as far apart as the Wishram and the Lower Kutenai,[113] and of 171*
others lying between, as the Middle Columbia Salish and the Nez Percé
in their original condition. K

The Nez Percé case calls for explanation. The present culture of 171*
the Nez Percé is Plains-like. But there can be little doubt that much, 105
if not the overwhelming part of the Plains traits among them, dates
only from the introduction of horses into the Snake-Columbia basin, 177
sometime between 1750 and 1800. With the horse came not only horse
gear and all the elements of Plains nomadism, but the opportunity for
buffalo hunting and trading on an extensive scale in the Plains. Many
of the Snake-Columbia tribes began to make periodic visits beyond
the Rockies from this time. Teit's account of the Middle Columbia SS
Salish makes it quite clear that prior to the coming of the horse, 114
typical Plateau culture, practically devoid of Plains elements, pre- 105
vailed over the entire area. Even the picture of life among the Nez
Percé and their neighbors presented to Lewis and Clark as late as 177
1804–6 was far more that of the Plateau at large than it is in our own K
day. The earlier situation is largely obscured by the fact that the 171*
Yakima and Klickitat in their eastern Washington location have many
Plains-like features. Teit's investigations make it reasonably certain, 105
however, that the situation prior to the end of the eighteenth century 177
was quite different. At that time eastern Washington to south of the
Columbia river was occupied by Salish tribes with typical Plateau
culture. Subsequently the Yakima-Klickitat moved northward, prob-
ably from east central Oregon, to their historic habitat.[114] It seems
reasonable to assume that up to that time they, like the Nez Percé, had
little in the way of Plains culture. K

Even today the food habits of the Sahaptins are not those of the 171*
Plains. What I am suggesting here is that the balance of vegetal 177
products and fish, now nearly even, rather favored fish in the days 178•
before hunting was so readily followed. 262

So far as general habits of life go, the river culture of the Klamath K
links them also with the tribes on the lower reaches of the Klamath 101
river. But their food habits do not quite coincide. Yurok, Hupa, and K
Shasta all make a larger use of acorns than of fish, although observers 171*

ELEMENTS DENIED

BASIC ECONOMY

Hunting

223 Snares, nets, traps, booths and blinds.--Bag
net used for waterfowl. Poles with stones as
224 weights for deadfall. Pitfall with noose in
bottom of pit. Arrow with string attached. Decoys,
disguises; other hunting techniques.--
Wooden head used as visual decoy. Live birds
used as decoys (At: recently only). Live mammals
[178] used as decoys (Kl: recently only). Hide
fan, to smoke out rodents. Butchering of large
game.--Deer's eyes eaten raw by hunter.

Fishing

226 Nets; weirs, scaffolds, pens; traps.--Tule-wrapped clay ball sinkers. Bag net dragged. Shell rattle on net. Stick pens, not associated with weirs. Basketry or pole trough. Angling; other techniques.--Feather "fly." Hair "fly." Hair string or ball. Knot or block on end of line. Shooting fish taboo. Lamprey gaff. Buckeye used for poisoning fish. Fishing observances.--Special disposal of salmon or other fishbones. First-fish rite: priest or chief catches first fish; only priest or chief eats first fish; similar rite for lampreys.

Gathering

222 Gathering techniques and observances; preagriculture.--Stone ring weighted digging stick. Digging stick with footrest. Bone or horn pointed digging stick. Stone pointed digging stick. Horn seed beater. Seed knife. Agriculture. Irrigation of wild-seed crops.

Domesticated Animals and Pets

231 Dogs, birds, bear, etc.--Domesticated animals, other than dog. Named after owner's totem. Separate dog house, conical, thatched. Own totem animal kept.

Food and Its Handling

262 Animals eaten.--Road runner (informants from
825 all groups except MF, NF, MV ignorant as to any
bird by this name, which indicates its probable
absence. MF, NF do not eat it, MV regard it as
poisonous.) Buzzard (WS, MM, NF, NM informants
stated buzzard absent from area). Crabs. Slugs.
252 Frogs. Food preparation.--Small mammals pounded
before eating. Dried meat or fish ground, berries
added. Bone awl for lamprey splitting.
Acorns leached in openwork basket. Acorn "coffee"
(NS: modern). Stone boiling in stone
bowls; in hide in ground; in paunch in ground.

Klamath Marsh

ETHNOGRAPHIC NOTES

BASIC 1

Hunting

Driving and pursuing.--

000 2. AE: Antelope doctor sings (charms) antelope; animals come toward round tule corral, with single entrance. People stationed outside corral wave branches to frighten antelope, head them toward entrance. Woman inside corral kill (club?) antelope. Done in spring, for antelope only; not for deer.

5. WT: Noose hung at funnel end.

6. As described by Dixon, Maidu, 192-193. SW: Deer driven along straight-line fence, in winter; no pit.

7. AW: Over cliff into snow, on Pit River.

8. See also element 113. SW: Fat deer run down from mountains by hunters into river in autumn; other hunters shoot deer as it floats down-river.

9. E.g., in narrow canyon.

10. Mo: Net of this type mentioned in myth; not actually used. SW: Snares set on deer trails, but deer not driven down trails. See element 28. At, AW: Set net up above water, on long poles; approach net at night in canoe (no light on canoe) and birds fly into net. AW: Also drive rabbits into nets, but only occasionally.

11. Kl: See note 44.

[224] 12. Kl: Mountain encircled with fire in daytime; 30-40 men, some women, gather the deer. Mo: At night, for deer.

14. SW: Elk especially hard to kill; run elk down, in order to shoot it.

15. NS: 2-3 men or more pursue wounded deer 4-5 days sometimes.

21. AE: Hunters on snowshoes run herds of deer into narrow canyons; snow "has to have a crust on it, to hurt deers' legs."

23. AE: In fall only, when water scarce and big bucks fat, hunter tracks buck with dog; "he camps right on the deer's trail until he shoots it; usually it takes 2 days."

Snares, nets, traps.--

24. MV: Use bow and arrow chiefly in hunting; boys use sling. Eat deer mainly in fall; rest of year eat salmon, sucker, sturgeon, ducks, vegetable food. "The people didn't have a hard time getting a living here in the valley, so they didn't use so many snares, nets, traps, for game."

262
178
224
26. Kl: Informant stated several times that Klamath Marsh group did not eat rabbits, squirrels, other small mammals. "Lately they do, though; they eat ground hogs." He could give no reason for former nonuse of small mammals. Spier, Klamath, 156-157, lists porcupine, beaver, ground hog, mink, otter, raccoon, jack rabbit,

[169-A]

ON THE ELEMENT LIST

ECONOMY

224 cottontail rabbit, ground squirrel, tree squirrels
[178] as having been eaten, but observes (p. 155) that
"the Klamath are not much given to hunting." Cp.
[262] elements 361-380. Mo: Secure rabbits only if
chance upon them. MM: Rabbits scarce; kill 1 or
2 occasionally; no nets, surround.

28. Kl: Noose, k'nIs; set up on sapling, or limb of tree, at night, for deer. Smaller nooses set on ends of poles on riverbanks at night for ducks. SE, SW: Deer snares used only at night; Mo, At, AW, AE, WT; day and night.

29. Kl: See note 28.

31. Kl: See note 26. AE: Twine snares suspended from clumps of sagebrush. This is a recent method of securing rabbits.

223 32. At: Woodpeckers; noose suspended over hole; end of noose tied to branch of tree.

36. For geese and duck; described by Dixon, Maidu, 195.

39. AW: See note 10.

40. WM: Ducks, geese, fly across McCloud area, but rarely light on McCloud River; do light on Upper Sacramento River; plentiful on Pit River. MM: Ducks obtainable occasionally in winter only; not many.

42. At, AW: See note 10.

224 44. Kl: Large net set on stakes in wide, closed circle, to surround herd of antelope. Brush fastened to top of net. Clumps of brush (within area encompassed by net) set afire at several spots, to frighten out antelope; when latter run out men stationed inside net wave the brush affixed to top of net, and others shoot antelope; women sometimes secure antelope barehanded, if animals exhausted. Surrounds (nel'qa) with nets such as these held in Williamson River, Klamath Marsh areas; "wherever they saw lots of antelope in valley."

000 47. WT: During mating season of gray squirrels, stretch nets around tree trunk, 2-3 ft. from base of trunk; no opening in net; as squirrels frolic from 1 tree to other, they are caught in nets.

51. SE, MM: Woodpeckers removed by hand from nest; eaten and topknot saved. At: See note 32. NF, NS: Woodpecker holes stopped with grass. MV: Shot with bow and arrow, in fall.

52. MV: Net draped over cascara bushes, where quail roost.

53. SW: Basket similar to platter shown in Dixon, Shasta, p. 400, fig. 76a, used. WM, WS: Long tubular basket, with small round mouth at 1 end, woven of willows, set inside brush double lean-to in winter. Snow on ground inside lean-to cleared off and acorn meal sprinkled on bare ground; when birds inside house eating meal man throws rocks at walls of lean-to; frightened birds fly into basket; man crawls into lean-to and secures birds in the basket. Same device

[169-B]

262 510. Kl: Inner bark of yellow pine secured
824 in June; by July "too hard."
512. Eaten fresh, raw or cooked on coals;
000 dried, for winter, strung on willow withe. MM,
NF: Ground burned for better crop; denied by
MV. MV: Cooked with fish.

Eating customs.--
515. WT, WM, WS: For acorn soup.
516. WM: For acorn soup. WS: For acorn soup and deermeat.
[264] 519. Kl: Eat any time during day; sometimes
men eat alone, sometimes men, women, children eat together.
521. Fresh food cooked and served. WT: Fresh batch food not cooked; "they dish out whatever they have on hand and set it before the visitors."
524. NF, MV: With buckskin.

Storage of food.--
525. AW: Acorns stored chiefly in pits; "too cold here in winter for outdoor granaries; have to bury acorns."
527. Bark used as cover for top; dirt piled up around stump.
528. Mo: Poles occasionally laid across boughs of cedar tree; tule sacks containing food stored on this pole platform. AW: Food stored on platform in oak tree; "poison" (animate) set on top of food; if any person, animal appears to steal food, poison shoots thief.
530. For illustration of this type, see Kroeber, Handbook pl. 38. WT: Informant, shown picture of granary just referred to, stated WT use similar granary, but that it is thatched (?) to some extent on sides.
531. NM, NS, MV: 4 upright posts only, for frame. NM: Hole in bottom, to take acorns out. MV: Hole in side.
532. AE: Food, hides hung up in branches of junipers; popular method of storage.
[251] 533. Kl: Recent custom; "may have done it
[178] formerly also." NS: Used for temporary purposes only.
539. AW: If leaving village for a time, bury acorns in pit dug inside sweat house; cover hole with tule mats, etc.

Exchange of food.--
540. Kl: "Whoever has no food, Indians give
262 him some; they help each other, just like 1
437 family." MV: Informant emphasized fact that between villages food given as gift, but also mentioned that mountain varieties of acorns are purchased from MF, MM groups.
542. AE: Food divided in time of famine.
545. Kl: If 2 men hunting, meat divided
224 equally; if more than 2, killer gets slightly larger share. Mo: Killer keeps deer hide. SW:
000 If 2 men, killer gets most; if meat cut up, cooked or dried and divided in camp, all receive equal share. If driving deer into river, driver gets head, hide, foreleg of deer. At: Killer

000 2 arrows simultaneously from bow in war; informant's father authority for this.

1048. MM: For shooting game. For shooting in war, arrow is underneath bow.

1049. SE, SW, At, AW: Rich man uses skin of gray fox, otter; ordinary man uses skin of raccoon, wildcat, kit fox, fawn. WT: Spotted fawnskin. WM: Rich man uses otter, fisher skin; sign of wealth. Ordinary man uses fawn, wildcat skin.

1064. Mo: Purchased or traded for; wealthy persons only.

[411
726
178] 1067. Kl: Denied for pre-white days; "now people use spears." At: Ascribed to Kl; denied for At. AW: "Yana used obsidian knife on an 8-ft. stick."

Daggers, slings, bola; armor.--

1071. AW: Obsidian "butcher knife"; jabbed.

1073a. WT, WM, WS: See 2853 and note.

1078. Mo: Natural clay balls, or moist clay picked up, rolled between hands.

1080. NF, NM: Single rock, shaped, 1 end heavier than other, tied to 1 end of string. A NF relative of informant, who had never seen any specimens of this implement but had heard it described, voluntarily likened it to bola.

714
824 1081. Kl: Made of split serviceberry stalks, woven into form of tunic; tied together on right side, under armpit.

1082. Kl: 1-piece; no sleeves; 2 arm holes; tied together on 1 side and at top, over 1 shoulder. Arrow unable to penetrate such. AE: Ascribed to Kl; said to have been made "like an apron, lacking any back piece."

000 1084. AW: String in center, by which to hold shield. Used also against guns, in recent times, but "didn't work."

Household Implements

Mortars and pestles.--

[412] 1085. Among several groups bedrock mortar used chiefly for substances which require hard pounding, such as acorns. AW: Pit mortar in solid rock, used by shaman to pound his poison; regarded as "dangerous." AE: Informant stated pit mortars occur in vicinity of Fall River (AW area); used, according to him, to pound acorns in (see above). MV: No rocky outcrops suitable for this type mortar present in area.

1090. MV: "People did not want to have anything to do with objects which had been already made." See also note 1093.

1091. Mo: Small mortars used to keep paint in. SW: Not only mortar, but small stone pestle of "dangerous" variety (found, not manufactured) used by doctor. When treating patient, shaman sends this pestle upward; it travels by short cut to road which dead traverse, and blocks this road, so dead person cannot travel over it; "then there is a chance for the doctor to cure the person, since the road is blocked." Old

000 decorated with this overlay; therefore boiling baskets not decorated.

1303. AE: Imported, mainly, from Paiute groups adjoining AE on E, but a few also manufactured by AE. Have used them "for many years; the Paiute got that jug from a little horntoad that lives out on the desert; he had one of these, so they learned from him. Then the AE learned from the Paiute, a long time ago."

1305. AE: Some dislike expressed for pitch coating; water tastes "bitter."

1306. AW: Three types used: (1) large basket, used for transporting fine seeds. (2) large, used for carrying wood, acorns, other large objects. (3) smaller than first type and made to sit flat on ground. Used in conjunction with beater, when collecting fine seeds; during day's gathering woman dumps contents of this seed basket into larger basket of first type, which is true pack basket, and carries seeds home in latter. Distribution of such a separate seed-collecting basket probably widespread in California, but as matter not enquired into fully enough among various groups, all conical seed baskets are classed herein as pack baskets, although seldom regarded as such by those making and using them. WT: Three types used: (1) Large basket with designs on it; used for packing. (2) Large basket, used as pack basket. (3) Smaller basket with designs; used to beat seeds into. Some question as to whether third type has rounded bottom or is truncated cone, but it sits by itself at any rate.

1307-1308. AW: Refer to large pack basket used for acorns only. WT: Refers to large plain pack basket.

1309. SE: Specimens of such, attributed to Shasta, seen in display at Lassen National Park Museum. AW: Refers to small seed gathering basket (type 3; see note 1306).

1311. AW: Refers to large pack basket (type 2; see note 1306).

1312. AW, WT: Entry refers to types (1) and (3); see note 1306.

1313. SE, SW: Specimens of close-twined conical burden baskets, attributed to Shasta, seen in collection of Lassen National Park Museum, however. AW, WT: Refers to type (1) only; see note 1306.

1314. WT: Entry refers to type (3) only; see note 1306.

1315. AW: Entry refers to type (3) only; see note 1306.

1317. AW, WT: Entries refer to types (1) and (3) only; see note 1306.

285
531
237
178

Baskets: decoration.--

1337. Kl: Formerly used in natural color, now dyed yellow. Kl, Mo: Used on "expensive" baskets only.

000 1338. At: "Shiny feathers from duck's neck; used sparingly. NS: Woman making feather-decorated basket remains indoors until basket

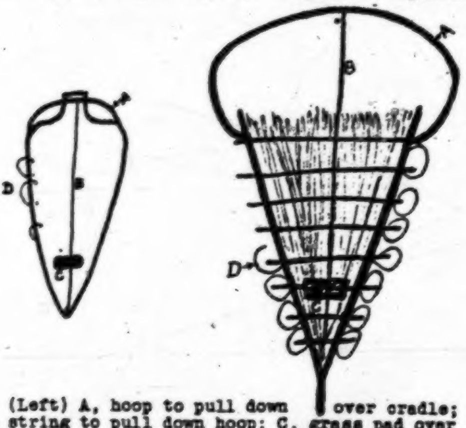
000 completed; reason unknown. MV: Small basketry disks, used as earrings, only variety feather-decorated basketry ware.

1340. NS: Woodpecker and quail crests used. MV: Woodpecker, quail, and mallard duck feathers used.

285 1341. Kl: Black, white, tan; porcupine quills
531 natural color formerly; now dyed yellow. Mo:
237 Yellow, black and white, plus tan background.
178 WM, WS: Red, black, white, yellow, plus tan.
NM, NS: Red, white or tan, black. No specimens of any 4-color baskets seen.

Cradles.--

854 1342-1352. Two types cradles entered under elements 1342-1352 for several groups. If entry refers to 1 of 2 types only, note records to which entry refers. Positive entry without note means entry applies to both types. For additional data on use of cradles see 3263-3286. Kl: Cradles of indeterminate type, between sitting and lying forms; have been somewhat arbitrarily entered as
000 lying form (see 1353-1363). Mo: Indeterminate type, like Kl, but apparently used more as sitting than lying cradles. Type (1) first cradle, for newborn babe; shallow tule basket cradle. Type (2) second cradle, for older infant; willow cradle with pointed bottom that can be stuck in ground. SE: (1) First cradle; board (see left figure). (2) Second cradle for older infant, Y-frame (see right figure). Informant emphatic infant sits in both types cradle, "with feet hanging down," although child could also lie down in both types. SW: Types (1), (2) for newborn infants, older infants differ only in size; both always used as sitting cradles. At: (1) soft tule cradle, used 2-3 months. (2) Same shape cradle, used for older infant. AW: (1) small cradle for newborn infant, twined, of wil-



(Left) A, hoop to pull down over cradle; B, string to pull down hoop; C, grass pad over which child's legs dangle; D, lashings.
(Right) A, willow hoop; B, string to pull down hoop; C, rolled tule mat over which child's legs dangle; D, lashings.

000 2475. MV: Shoe-leather disk, also top of tin can used for recent buzzers. Using buzzer "makes people sick; don't use it much."

2483. SE: Name for buzzer similar to that for bird that makes whirring noise at night; when playing with buzzer people say they "are making the deer fat."

2484. WM: "The puisus (Achomawi) play this, but WM never do."

2485. WT: Informant had never seen Indians play this; had seen Whites doing it.

2489. AW: Names of 2 figures: Sundown; Spider's House.

[524] 2490. Kl, Mo, SW, AW: Popular moving figure is that of "2 coyotes running from each other."

2492. Mo: If play in summer, ensuing winter will be severe.

2494. SW: Figures made during first quarter of moon, in spring especially, to make moon grow (by stretching string).

2494a. Mo: Both informants stated stilts aboriginal. At: "Danced on ice with stilts". Like Mo informant, At informant had used stilts as girl.

2505. WT: Willow-bark bag, sand inside.

2508. Mo: 5-6.

2520. Mo, MM, MF: Narrators presented with small amount of food by auditors; NS: uncertain about this; MV: denied. Not inquired into for other groups. NF: Myths told to youths, men only (during secret society initiation?); informant for this group a woman.

[538] [855] 2522. Kl: Belief held more in jest than in earnest; told to small children who "would never go to sleep."

2523. SW: If myths told toward spring, look out for rattlesnake.

[481] [883] 2527. Kl: Youths "made to swim in winter anyway"; no rule which applies to myth telling per se.

Social Dances

Circle dances.--

535 177 2529. Kl: See note 2076. Dance Kl brought back from N with drum was "a round dance; men and women danced, holding hands, men on 1 side, women on other of single circle, with fire inside in middle. It was held any time of year, but mostly in summer, just for fun. Given at night; people stopped dancing around midnight. [No leader who brought it back, or no data on such.] One man might say, 'Let's have fun'; people told each other; they came and danced. The drummer was the leader; he sang, and the men and women dancers sang too. The drummer stood by himself; just 1 man drummed. The
● [178] Kl no longer give this dance; the old people have mostly died." Mo: Dance relatively slight affair;
000 "a few young people assemble for 'evening joy' dance; join hands and go around fire in circle; old man watches them. When they become reckless, he stops dance." SW: Circle dance (k'aphek), an old summer dance, given for pleasure sometimes;

[206-B]

000 3773. WT: Each month when period begins menstruant stands over nest of piss ants, allows ants to crawl up her legs and bite her, to induce menopause.

Marriage

Child betrothal.--

584 3774. Kl: Boy and girl know nothing of arrangement; boy's father asks girl's, "What do you think about it; you're going to let her get married when she grows up; what do you think?" Girl's father says, "Yes; I think it [will] be all right." Boy's father then gives girl's people food; "that's how they hold her. When girl grows up, perhaps another boy tries to get her [to marry him]; her father says, 'No; you already belong to that boy over there; we already gave you to those folks.' Boy's father then tells his boy to go get girl, and boy goes after her, and brings her back to his father's house for about 5 days. Even if girl doesn't like youth, she has to comply, and her parents have to give her to her betrothed." Before marriage, boy may take gifts to girl's parents--buckskin, and such. Child betrothal an old form
● [178] of marriage; informant had never seen it carried out in his lifetime. SW: Boy's father sends
000 buckskin load of money by friend to girl's father; latter "sits there and looks at money, and finally accepts it; or, if he doesn't, boy's father may hire shaman to bewitch girl, so she becomes loose woman. AW: Practiced by wealthy. After betrothal arranged, "don't allow any other man to touch that girl." Child betrothal characterized by informant as "real old-time trade." MM: Here, as among other groups, child betrothal highly approved form of marriage. Couples may be of about same age, or young girl may be paid for by old man, who marries her after she reaches puberty.

3775. AE: Usually boy's father goes to girl's family, taking hides, food with him; if girl's father does not wish to enter into agreement, he does not touch present. However, girl's father, if headman, can also start negotiations, if he wishes to. If girl and boy of 2 different local groups betrothed, boy's family "have somebody [who lives near girl] watch the girl until she is grown to see how good or how mean she is."

3776. SE: At time of actual marriage only. WT: See note 3781.

3777. Mo: Boy's side gives meat, girl's side, roots. But concept of "buying" girl recognized, although exchange of gifts also emphasized. SE: Exchange of gifts at time of actual marriage only. At: Boy's side gives meat, girl's side acorns and baskets, while children are young. AE: Exchange some presents, not many.

[584 3777a. Kl, Mo: Denied any taboos; children
784 ignorant that they are betrothed until grown.
858] SE: After boy and girl are betrothed, taboo for them to see each other's face. Boy wears buffalo

[223-A]

00 or elkhide over head when going out of house; is "bashful." If betrothed wishes to give him bad luck, she climbs up on top of sweat house and looks down inside when he is in there eating; this makes him sick.

3781. SW: Man, A, may hire shaman to kill someone on his, A's, behalf. For this, A pays shaman by giving him his daughter, for shaman's son to espouse when both children grow up. Issue of such union are "very valuable"; they are valued "beyond any price." WT: Marked reaction against using child to pay debt. "Chinese do that; they buy women; we never did this."

3783. At: 10 strings shell beads standard payment for bride; paid only at time of marriage. MV: Beads given to girl's mother; she sends back yellowhammer bands, and other ornaments, to boy's family.

Bride purchase.--

584 3785. Kl: Youth's parents tell youth, "You'd better go over and get that woman [naming her], if you want her." Youth says, "Yes, I'll take her, if she likes me." So he goes over to girl's family's house, talks to girl alone; she may refuse, but if she accepts him he brings her back to his father's house, where she sleeps with him 3-5 nights. Girl then returns to her home, unescorted. At end of 5 days her relatives (father, mother, mother's relatives, some neighbors--perhaps 10 people altogether) escort her back to her husband's family's house; take gifts of food, which they present to his mother. In return, groom's family gives dried meat and suckers to bride's parents. Latter distribute these gifts among all people who have come with them. Both families eat together; bride and groom sit together on mat (see elements 3818-3819a). Bride's party departs same day they came, except for bride's mother, who may stay for 3 days, teaching girl how to live, telling her to "work hard all the time; don't let anybody tell you what to do; I'll tell you myself what you can do." In recent times, groom's and bride's fathers have both made speeches at time of marriage observance; tell couple how they are going to live, and other things. Informant had seen them do this

● [178] when a boy. Also, recently, groom's father gives horses and clothes for girl; her family also gives groom's same, "just like a trade. In early

000 days, though, just gave food." AW: Youth's father goes to girl's father's house and talks to her parents, saying, "I like you; we'll 'treat' one another; I'd like to see those young folk stay together." The girl's father smokes, then says, "All right." Sometimes he asks his wife; she tells him it's up to him [father], all on him. Sometimes he says, "No, I can't do that." After this is settled, youth's father collects food and shell currency, then takes these things, together with his family, over to girl's father; big feast given. "It's just as though he's paying for that girl." If both families "have lots

[223-B]

000 that woman; he acts just like a boss toward her."

3975. WT: Also, in Upper Trinity subarea of Wintu, informant had heard of 1 instance of mother-in-law killing daughter-in-law after husband died. "The mother-in-law didn't want that woman to take another husband, so she killed her with a bone needle [dagger?]. She was sorry after she did it; but she didn't like the woman having another husband who would look just like her son; it would make her [mother-in-law] feel badly."

[587] 3976. In case there is no brother-in-law to ask.

3977. If there is no brother-in-law to receive the payment. AW: Sister-in-law may dispose of widow to more-distant male relative of dead husband also.

3980. SW: A divorce "puts a man and woman clear away from each other"; no payment rendered former husband.

562 587 593 3981. Kl: If man does not like his wife for some reason, he announces, "Anyone who wants my wife can take her, if they give me something. If you people don't want her, I'll kill her." The men discuss it; husband repeats the announcement, sets date when he will kill woman; some man finally takes her for wife, gives the husband something; "that's how they save a woman, sometimes." No one knows what trouble between husband and wife prompts man to do this, and man never tells; he doesn't beat his wife, he just sells her. Only done occasionally; when informant was boy such sales still taking place; informant had seen one couple separated this way. Woman not captive.

000 Intercourse; promiscuity.--

3984. NP: Girl cries, fights husband, so girl's mother sleeps beside girl first night latter sleeps with husband.

3985. NP: Do not allow people to sleep lying on back "like dead people"; lie on side and "put their heart in hiding" so no evil will befall sleepers.

[152] [192] 3987. Purse lips and make sound, "čk, čk," repeatedly, close to baby's face. AW: Rub hands over baby's face or neck while making sound; same done between adults. AE: "Learned to make this sound from animals--badger, racccoon."

3988. SE: No virginity tests, but observe boy's actions around girls. AE: If girl's, boy's legs get "heavy" (tired) during girl's puberty dance, sign he or she is not virgin. Spectators watch to see whether this happens. WT: Can tell whether girl is virgin or not by shape of her abdomen, if firm, smooth, judge she is.

[548] [178] 3989. Kl: Prostitution with payment recent custom only.

3990. WM: Especially at girl's puberty dance.

836 3991. Kl: Said to have been *extremely rare*; "girls never ran around; pretty hard to get a woman." Girl's parents wanted girl to marry man who could get her lots of fish, so she would eat

836 well after she married; advised her to take such
for husband. Youths never went round for women
[178] by themselves, formerly; both girls and youths
adhered to marriage rules. SE: Admitted, but said
000 to have been very rare, however. 2 women usually
accompanied girl whenever she went anywhere "in
order to see that men didn't bother her." At:
Mother kept girl beside her during night at fiestas (see also note 3960).

[836
848] 3996. Kl: Must marry girl; youth's parents tell him, "Get that baby back." Youth gets girl, without paying anything for her.

3997. WS: "Very few did marry the girl."

Transvestites

[838] 3999. Mo, MM, MV: Known by informants to exist among such tribes as "Pit River" (Achomawi) and Kl, but denied positively for informants' own groups. SW: Informant himself had many traits of transvestite, although he dressed in men's clothes; most of elements listed positively below for SW are entered from volunteered data and observation of facts rather than as result of direct questioning. At: Referred to as ya'wa'. NM: "In early days didn't have any [transvestites]"; informant knew of only 2 hermaphrodites (?), a Mexican at Auburn and a half-breed woman.

4008. "Because born that way."

4009. AW: Informant for At stated, "1 Pit River (Achomawi) woman, after she'd had children, dreamt to be like that."

[838] 4011. See note 3999. At: Referred to as brumaiwi. Wear false penis (?), made of pitch, suspended from belt.

Death

Treatment of corpse.--

[764] 4021. Kl: Body laid on pyre immediately, left lying there overnight; early next morning burned.

4025. Mo: Shamans only. WM: Painted red. Sun dogs considered sign of shaman's death, "because paint dead red." Red clouds presage death of someone.

4027. MF, NF, NM, NS, MV: Yellowhammer-quill band also laid with body. MF, NS: Also basket cut, so it will lie flat like plaque on top of chest; this buried with body. Cut basket on body lacking among NM, MV; dubious for NF.

4028. WT: Elkhide article of great value; chief wrapped in such, and grave "almost filled with shell currency and other valuables. Many visitors come from distance and bring world of things to put in chief's grave." WM: "Other groups [of Wintu] wrap body in bearskin cloak"; WM do not, except in rare instances where head, claws cut off old bearskin, and latter put in grave. New skin never treated thus. MV: Wrap wealthy in bearskin.

4030. NF: Also children up to 2-3 years old buried on their cradle.

[228-B]

strung on it. He never kills bird or animal of same species as his guardian spirit(s), but someone else kills these for him, gives feathers, skins to him. SE: See note 4946. SW: Novice acquires pole, with 10 different objects (feathers, skins) on it; this sacred, kept outside house when not being used during shamanistic performance; at latter, shaman brings pole, plants it in ground outside patient's house. See note 4992. At: After man begins to doctor patients he acquires eagle down, woodpecker feathers, yellowhammer band. Ties these feathers inside his whistle. Also acquires bunch supernatural feathers (kaku) which he keeps tied up on willow branch, near creek; when shaman dies, blood drips from these kaku feathers. When shaman first discovers these feathers they are singing; he walks up to them and picks them up. WM: Shamans pass on their feathers, when old and near death, to another shaman; "keep passing them on from 1 to another. Sometimes the feathers tell doctor to put them in the water ['bury' them]; or feathers may say, 'No, I want to be alive, give me to another doctor.'" If, on receiving the feathers a shaman does not know how to handle them, he tells them he cannot keep them and is going to put them in the water.

4871. At: See preceding At note. Shaman never brings these feathers inside house, or uses them in curing performance; there may be children playing around who might make too much noise; feathers might become disturbed, poison people.

4872. At: See note 4870 At.

4873. At: Also, if man dreams "good" (acquires luck) after birth of child, "he never tells about his dream; if he does, he won't have any luck."

Sucking doctors: doctor-making rites.--

4874. SE, SW: 2 dances entered for each of these groups: (1) dance which novice performs alone in sweat house immediately after obtaining vision; (2) public winter dance in sweat house, following which a novice shaman may start curing. If SE, SW entries for elements 4875-4924 relate to one type dance only, note explains to which; if entries relate to both types dance, no note.

[756] 4874a. Kl: Spier, Klamath, p. 113, says rites
[178] last 5 nights and days; my informant, who had
[184] danced at these performances, said 1, but probably he was referring to more recent curtailed performances. WT: 1-4.

4875. SE: Novice dances 3 nights, alone; public winter dance lasts 2 nights. WM: 4-5 nights.

4877. NF: Doctor dance (yomuse) starts in morning; at noon eat dinner; in afternoon dance again, then eat supper; then dance all night around fire. By daylight dance is over. Men, women shamans dance; women hold fox hides, wildcat hides on sticks, while dancing; men dance inside circle of women dancers, and wear yellowhammer bands on their heads. Novice doctors join in dance. During daytime dancing, shamans, in turn, hold cocoon rattle on stick, gaze straight

[242-A]

[Klamath Reservation]

I was informed were sold for three horses each, some cheaper."[6] 000

In the changing conditions of the early nineteenth century, K
the Klamath were caught up in currents generated from without. 175
The advent of horses and of firearms made it possible for the 177
tribes of the east-central Plateau, the eastern Salish and eastern 648
Sahaptin, to cross the Rocky Mountains, to hunt buffalo and [231]
enter into relations, both peaceful and bellicose, with the tribes [411]
of the Plains. As they came under Plains influence, the appeal K
of Plains garb, of parfleches and tipis, grew.[7] The Klamath were [291]
attracted to these new goods, and the clothing at least came to [556]
replace or supplement traditional forms of wealth.

Moreover, the horse and the gun had revolutionized warfare K M
patterns. Although traditional enemies beyond the Cascades 175
were preoccupied with white settlers, on the east the Paiute were 177
gradually developing mounted bands of great mobility and 726
striking power. The Klamath and Modoc were not slow to seek 231
the new instruments of war. 411

The opening trade to the north brought a corresponding K M
intensification of the raids carried south into the territory of the 175
Pit River tribes—the Achumawi and Atsugewi—to capture women 177
and children, Pit River bows, and other loot. As Chiloquin, one 721
of the leaders of the time, recalled:

> When the Snakes [Northern Paiute] made war on us that made us keen to fight other Indians and we made war without provocation on the Pitt Rivers, Shastas and Rogue Rivers, but they never made willing war on us. Those wars lasted a great many years. We found we could make money by war, for we sold the provisions and property captured for horses and other things we needed. It was like soldiers nowadays who fight for money. We made war because we made money by it and we rather got to like it anyhow. The Snakes provoked us to make war on them.[8]

With developing warfare and the accumulation of foreign K M
wealth came a gradual transformation of Klamath, and to a 175
lesser extent, of Modoc society. The forays into hostile country 178 •
enlarged the scale of the war party. Chiloquin speaks of a body 726
totaling one hundred warriors, which included, according to Spier,
members of all the Klamath tribelets, and took in some Modoc as
well.[9] A joint raid on the part of Umpqua, Upland Takelma, and
other western tribes brought one such retaliatory reprisal about

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10
Modoc NS17

[Klamath Reservation]

M
175 1850. Aggressions by Northern Paiute bands led to similar large-
178 scale forays into the country east of Silver and Summer lakes.
726 The almost endemic condition of warfare and the enlarging
K M scale of operations, together with the lucrative trade in booty,
175 brought about the emergence of a chiefly class, the members of
726 which based their power upon eminence in war and possession
182 of wealth, including slaves.[10] Their successes attracted followers,
622 and common interest as well as kinship prompted them at times
565 to cement alliances with shamans.

556 Thus they drew into their hands coercive powers of no mean
756 weight, for, as Henry Blow observed, "this [shamanistic] power
[754] was used by the chiefs to get rid of rivals and there are some of
us old enough to remember of doctors being paid to kill certain
persons and of their foretellings of the exact day they would
die."[11]

K The rise of the chiefs helped to knit together tribal loyalties.
M
175 A war party formerly consisted of only those among the able-
178 bodied men who were inclined to fighting, but a successful leader
622 increasingly transcended tribelet parochialism, drawing followers
619 from diverse hamlets and villages across the Klamath country.
628 As warfare became a way of life, the occasional allegiance ren-
726 dered while in the field became an enduring acknowledgment
of worth.

K In the growing eminence of the new leadership, hereditary
622 principles may have been operative. Chiloquin mentions his
father as having been a chief on Klamath Marsh, his own brother
175 as a subchief, and a sister as a chief. The father of Dave Hill,
a rising young war leader, was a village chief; while Allen David,
later head chief in reservation days, was the brother of Captain
George, a Klamath Lake chief. That family eminence was not
essential, however, is shown by the personal history of Lileks,
K of good—but not chiefly—background. Lileks was a transvestite
[838] in his youth until a supernatural experience vested him with the
power that was to lead him to be head chief of the Klamath.[12]

K A minor factor in these developments may have been the
195 interest of the whites in the centralization of tribal power, in
643 order that they might deal more effectively with responsible
648 leaders. In 1844, Elijah White, then Sub-agent for Indian affairs
177 met with some Klamath and Molala who had ridden into the

*657 177 764 two years earlier, about 1868, Chief Lileks had induced his tribesmen to abandon the practice of cremation in favor of the inhumation he had observed in trips to Jacksonville, Yreka, and The
*657 177 765 302 Dalles.[7] With burial came new symbols of mourning and, apparently, a partial relinquishment of the association with cropping the hair. A few conservative individuals, however, still resorted to the practice over a half century later.

• [178] Naming the Indians was a matter of administrative necessity.
*657 177 551 553 Officials, faced with the duty of identifying their charges, labored under the task of reducing unfamiliar sounds and lengthy, incomprehensible names into writing. For the Klamath, the addition of another name posed no problem. It had been native practice to use age terms for the very young—"My name is *niskag* (young girl)," one woman recalls telling her teacher—and to employ relationship terms when addressing kinsmen and occasional names in referring to others. The occasional names, of which an individual might have more than one, were often far from complimentary. Thus the literal meaning of the name of the Upland chief, Monchnkasgitk, is "One-who-has-a-big-belly;" while that of the individual later known as Allen David was "Black Anus."

Many new names were assigned when annuities were issued or when children entered school.

> It became one of the functions of the interpreter and clerk [recounts Good] to rename the stalwart braves, who were highly delighted with such commonplace appellations as "Joe Wilson" and "George Brown." "This is your name," he would say, writing it on a card, "and if you forget what it is, ask anyone who can read, and he will tell you." The bestower of names was sometimes amused at the corruptions arising from the Indians' peculiar pronunciation, as when "John Wesley" became "Whistler" and one who went forth as "Simeon" returned as "Sammy Andy."[8]

It may be added that the soldiers at the Fort and the settlers were also responsible for such names as "Great Eastern," "Old Faithful," "Skinflint," and "Skedaddle."[9]

*657

HOUSING

177 342 A relatively greater effort was needed to induce the Indians to abandon what Agent L. S. Dyar characterized as "their warm,

employees built a substantial bridge about 100 yards in length 657*
across the Williamson River, on which they propose to collect 177
toll. This will support several families."[55] Nothing more is heard 434
of the venture and subsequent work on bridges and roads took on [499]
a public character. A few women occasionally sold baskets and [494]
berries, and older Indians, generally women, were sometimes [462]
issued cinch rings and wove cinches as a means of support.[56]

Fur trapping provided an early source of income for some 657*
men.[57] At first, beaver, marten, and otter were especially sought, 177
and the available catch soon became depleted. By 1882, the 434
Klamath were turning to panther, bear, wolf, and coyote, preda- 224
tors which Nickerson claimed discouraged them from raising
sheep. "The Indians," he reported, "now hunt them for their
fur and receive quite an income from hunting and killing them."[58]
Carried on over the late fall and winter months, the fur trade
realized a total of $300.00 for those who followed it.[59] By 1891,
however, the revenue from trapping was on the decline.[60]

NATIVE FOODS

In the original designs of the government, farming and other 657*
"civilized" enterprises were supposed to supplant such ab- 648*
original pursuits as fishing, hunting, and gathering. From the 433
Agent's viewpoint, the retention of native subsistence methods
presented two major disadvantages. Not only did the traditional
occupations coincide in season with farming, but they drew the
Indians from under the direct surveillance of the Agency, and
even off the reservation. The issuance of rations, though designed
to provide a substitute during the transitional period, was re-
stricted as much as possible, in order to allow more funds for
other purposes.

It is clear from the graphic descriptions of the early Agents 657*
that they were well aware of the Indians' strong reliance upon 648*
native foods. The fish in Lost River, observed Dyar, ran from 433
two to four weeks earlier than in the streams within the reserve. 226
By late winter even the supplies of rations had been exhausted,
and the Klamath eagerly awaited the news from the south. "If
the Indians are not allowed to go to Lost River in the Spring,"
O. C. Applegate had pointed out, "then they will have to be
subsisted during the month of March."[61] The Lost River fishery 657*
178•
226

*657 continued to be exploited for fifty years, until the owners of the
177 abutting land put an end to it. On the reservation, the Sprague
226 and Williamson continue to supply a catch, although the drying
[251] of fish for the winter, common enough on the Lower End until
about thirty years ago, has now passed into disuse.

*657 Similarly root gathering continued to be an important activity
• 178 for many years, leading Nickerson to suggest that several of the
177 palatable and nourishing roots used by the Indians for food
222 "could be materially improved by continued cultivation."[62] "Root
[412] probes," or "camas diggers," as well as "fish spears" and fish
[227] hooks were forged by Agency blacksmiths for years.[63]

Wokas long remained a staple for the Klamath. In 1881 Nickerson,
*657 noting that each family gathered some five to fifteen bushels,
178 added "this wokus, with dried fish, forms a large portion of the
222 food of those who have not the money with which to purchase
262 flour and groceries."[64] About the turn of the century, Coville observed a thriving wokas-gathering industry with a vast expanse of marsh to exploit, and speculated on the possibility of processing the seed commercially as a breakfast food.[65] The decline of wokas gathering parallels in time the Indian's diminishing use of dried fish, another winter food.

*657 A similar course can be traced for those fall activities, hunting
177 and berrying. From at least 1872, Indians were reported leaving
178 the reservation in September to hunt and gather berries in the
222 Cascades.[66] In addition, the men on occasion went on a spring
224 hunt for antelope and mule deer at the north end of the reservation.[67] Gradually the fall berrying and hunting came to be concentrated at the "huckleberry patch" on Huckleberry Mountain, southwest of Crater Lake. Hunting has continued to be both a sport and a means of providing food; and if the preparation of jerky has declined, it is because the freezer has displaced it.
[251] The drying of berries and wild fruits has been rendered obsolete by canning. There is local testimony that the killing off of predators by fur hunters and stock raisers has caused an increase of deer upon the reservation itself. It is not infrequent for a single family to consume six to fifteen or more deer in the course of a year. One tribal leader from the Upper End, a man then less than forty years of age, remarked in 1958 that until his family

657*

moved to Klamath Falls when he was nine years old, he had 177
eaten only venison and had never tasted beef. 178 •
222

In their continued loyalty to traditional foods, the Klamath 224
were responsive to several advantages beyond—but including— 657*
appeal to the palate. The techniques involved in securing them 178
were relatively simple and familiar, imposing few demands upon 177
the individual for capital investment in tools and labor, required 262
little in regularity of routine, and involved the cooperation of only small groups. Participation was direct, self-controlled, and provided an immediate reward.

Consequently, the issues of beef and flour were assimilated in use to native staple foods, rather than replacing them entirely. Flour was given the name that also denoted a meal made from ground seeds and cattail roots. It must be borne in mind that the rations were issued at times when other foods were largely exhausted, and probably because of this certain anomalies were introduced. Since the issues were public and general, there was no need, as there had been formerly, to conceal foodstuffs from neighbors. Thus, bread and biscuits were the first foods to be baked in the coals of the house fire, rather than in a special outside cooking hut; and, perhaps because of the method of issue, the food was shared by household, rather than by an individual family.[68] The practice of eating while the food lasted strained Agency resources: the Commissary at Yainax estimated that an Indian could easily dispose daily of two pounds each of beef and flour.[69]

The example provided by white cooking, the use of salt, sugar, 657*
and baking soda, as well as new foodstuffs, together with the 177
general acquisition of such utensils as the kettle, coffeepot, and 178
spider, extended the variety of culinary techniques and even 262
enhanced the preparation of native dishes. One woman recalls 263
the ease with which one could hull wokas with a coffee grinder; 415
and when a kinsman borrowed that useful instrument, she used her wokas mulling stones to grind coffee beans. Through it all, native foods continued to be favored, and the observation that "the Indian [school] children are very fond of fish" is nearly as true today as it was in 1893.[70]
657*

An analysis of the statistical and narrative reports of the 177
178
262

*657 177 178 262 Agents shows that they consistently tended to undervalue the contribution made by native foods to the Klamath economy. From the first statistical entry in 1882, when they are estimated to contribute forty per cent of the food supply, native foods steadily decline in the records, leveling off from 1888 to 1893 at approximately twenty per cent, and, after a spirited fluctuation from then to 1901, rising slowly to ten per cent in 1904. That dependency upon these foods declined from total to partial reliance is admissible. O. C. Applegate, while Superintendent, reported that by the turn of the century some of the food resources had begun to dwindle under intensive use. He found the fish less abundant than in the halcyon days of the first Agent, and observed that both water fowl and prairie chickens had been overhunted.[71]

While conceding the decline, a critic may well find fault with the bland assessment of Elisha Applegate a decade earlier (1891) that native food quests were then "indulged in more as incidents and to add variety of life than as occupations to be seriously depended upon."[72] The year after Applegate made his report, one graduate of the Indian school, upon returning home, saw things in a different light. "Whenever I got job, I pitched hay. I did fishing and hunting, and I had plenty to eat all the time . . . lots of deer meat, and I used to pick wokas too."[73] If this was an indulgence, it was in sheer survival.

The sources of error are not hard to find. Administrators could form only the most general opinion of the contributions made by native foods, and must have tended to judge from the examples provided by Indian employees immediately at hand and from the more acculturated Indians. Moreover, their reports were in part designed to illustrate the progress which their charges had made away from their former customs. Accordingly, they understated the degree to which native economic activities conditioned the acceptance of new modes of earning a livelihood and supplemented those which had been taken up.

*657 177 Consider, by way of example, the pursuits which in the 1880's could be combined according to taste, need, and season.

178 221 433 [313] [464] [489] Lumbering and logging were winter and spring enterprises, with intermittent logging taking place in the fall. Labor for the contractor at the Fort and for settlers ran from spring through

657*
177
178 •

fall; while freighting, limited by road conditions, had the same range of seasons. 221

For the farmer, splitting rails and fencing started in the winter 433 and ranged toward spring, as did the clearing of ground. Plow- [464] ing and sowing of grain might start in March, while vegetable [489] gardens were not planted before May or June. Harvesting and [241] haying took place in late summer and threshing in the fall.

The stockman rounded up and branded his cattle at first in the [231] fall and later in the spring. He sold his beef in the fall, then drove his herd to winter in the upper valley of the Sprague.

Those who relied upon aboriginal foods fished in the late winter and early spring, dug roots or hunted antelope and mule deer in late spring, gathered wokas, wild fruits and berries in the fall, hunted in the Cascades in the fall, and trapped for furs in the winter. 657*

Beyond this lay the domestic cycle. Homes were built or re- 221 paired in the spring and fall, supplies were bought in the fall, 342 and fuel was gathered in the fall and winter. 356 313

This summary, bald as it is, will illustrate the fact that many 657* more ventures were now open to the enterprising, as well as a 433 wider range of relationships. It was possible to draw from 464 several cycles activities that were seasonally compatible. Thus, 177 when the harvests were in, fully one-half to two-thirds of the 178 men might leave the reservation on passes to work for whites, taking their families with them.[74] Frequent crop failures drove many to seek outside employment to provide for the coming winter. Because new tastes had given rise to new needs, many at this time forsook those traditional pursuits that conflicted with more lucrative employment. Nor did money alone lie at the root of those preferences. Work for white settlers and freighting provided variety and seasonal mobility, opportunities to meet people, to change scenery, and to escape on occasion beyond the rule (however benevolent in intent) of the Agent.

The new opportunities were open primarily to men, consonant 657* with the roles of the sexes in nineteenth-century rural America. 433 For them the new system, aside from a certain administrative 177 favoritism, provided an equal chance for advancement. It is no 178 accident that a number of the earliest employees of the Agency [567] were Pit River Indians, of whom it was later said: ". . . as a

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*657 general thing, they are quite prosperous, and energetic, having
433 learned how to work well as slaves for the Klamaths."[75] One of
177 them, the Indian named Skedaddle, formerly the slave of Chief
•178 Lilu, was first employed as farm laborer by the Agency.[76] During
567 the Modoc War he enlisted under the name Henry Jackson. In 1883, he reappears as an interpreter at Yainax, in which office he cut hay and cared for the Agency herd as well as butchering the beef cattle.[77] Subsequently, he contracted with white ranchers to split rails, taking half his pay in cash, half in cattle, eventually amassing a sizable herd, which multiplied until it amounted to some eight hundred head of cattle and five hundred head of horses and mules.[78]

ANNUITIES

*657 It was Agency policy to develop the quality of industry and
*648 to ensure the growth of individual enterprise. From this standpoint, the annuity system, in providing rations, was a device to surmount agricultural failures, to carry the Indians through the winter, and to keep them settled quietly upon the reservation. At the same time, there was a danger, of which the Agents were soon aware, that such issues would sap the self-reliance of their charges. As early as 1865 when Lindsay Applegate took over their supervision, he found that, though the Klamath and Yahuskin were well enough supplied with native foods to sustain them through the winter, it was necessary to quiet "their loud clamorings for flour." Accordingly he "made some moderate issues to the chiefs and, through them, to some of their subjects who seemed rather needy." The issue, it would seem, was sought as a right and as an exemplification of the good faith of the government, for he adds, "I became convinced at this time of a growing disaffection among the Indians, on account of the tardiness of the government in fulfilling treaty stipulations."[79]

Discontent was compounded by the suspicion, possibly inspired by unofficial advisors among the whites, that inferior goods were being palmed off in the annuities.

> I was approached today [recounted Captain Sprague to Applegate in 1867] by a Sub-Chief who requested me in the name of all Sub Chiefs to be present at the distribution, and in case the goods distributed were not of good quality and deficient in quantity to note the fact and represent to the authorities at

ferred.[90] At another time, he seems to have proposed issuing seven mowing machines and four sulky rakes to leading and competent Indians, but was firmly instructed by the Commissioner, "as these articles are intended for the use of all, it is not considered advisable to allow individuals to have the entire control of them." He was instructed instead to loan them out.[91] 657* 648*

"As these Indians become more civilized," observed Nickerson, "their demands upon the mechanics become more frequent and pressing."[92] Indeed, he had to advise the Commissioner against the policy of issuing condemned articles to the Indians since "they will bring them to the shops and demand that they be repaired."[93] It is plain that the frequent call, as a matter of due right, upon the services of Agency personnel lay at the bottom of Nickerson's desire to decentralize equipment by issue through the chiefs. To counter these demands, he had Indians trained to operate the mowing machines, sulky rakes, and other agricultural equipment. When Indian farmers desired to use a machine, the operator was to be paid for his labor and the use of his team. Nickerson added, "I have notified those Indians who are able to do so that next year they will be required to purchase their own machinery for haying purposes. Some of them are already laying aside money for that purpose."[94] Emery instituted a similar program whereby individuals paid an Indian workman for repairs made in the shop on their wagons.[95]

The ownership of a wagon required considerable outlay, more than some persons could muster. Hence, as Emery noted, wagons, plows, and other implements, as well as cattle and horses, often were held in common by two or three Indians.[96] [422]

With their introduction to an economy in which money served as a mediator in relationships there are indications that the Indians began to develop the view that all positions advocated by the Agency must carry remuneration. Nickerson, reviewing possible candidates for Indian judge, found himself obliged to state, "Those persons with most financial ability are least disposed to serve without compensation and generally least well qualified for such service."[97] New forms of wealth had come in, new desires, new needs, and native society was transformed in the effort to attain them. [177] [178] [434]

> *657 A large number of Indian offences come before this Court for
> *648 trial, consisting mainly of family quarrels, disputes about the
> 692 ownership of property and acts of licentiousness.[68]

With the accidental death of Crain, Jesse Kirk was appointed in his stead.[69]

Thus, within a generation the administration had replaced the popular leaders with those among them who were Agency employees, and in turn had supplanted them with the products of its schools. Legally constituted authority was administered through the Agency, at first through a customary court of chiefs and later
[625] through a Court of Indian Offenses. The Indian police, who took their orders directly from the Agent, were satisfactory to him as the instrument of his hand. Not so the courts, which tended instead to constitute seats of power alternative to that of the Agent. The result was to be that Agents tended to strengthen the police while circumscribing the functions of the courts.

*657 Meanwhile, beyond the administrative structure thrived an
*648 unacknowledged informal leadership, based as in former days
622 upon wealth and accomplishment. Unlike that of the Agency, it
571 was not restricted in position nor limited narrowly in function.
This was a leadership in which employees could also participate; and it was presently to see such diverse men as the old chiefs, Monchnkasgitk, Henry Blow, and Allen David, make cause with Dave Hill, and he with young Jesse Kirk, and he in turn with Jeff Riddle, son of Frank Riddle and Winema, the heroine of the Modoc War, and with Henry Jackson, the wealthy exslave. In this sense at least E. L. Applegate was right when he observed:

> [179] The tribal distinction among the Indians on this Reservation is
> [178] practically disregarded by the Indians, and the ancient preju-
> [101] dices are rapidly fading away. The general name of Klamath
> People seems to be superseding all other distinctions.[70]

[Klamath Reservation]

SEVEN

[P.95]

Social Change

WITHIN LESS THAN TEN YEARS AFTER THE RESERVATION HAD BEEN 648*
established, two communities had developed. The one at the 657*
Lower End was composed primarily of Klamath, with a small 361
number of freed slaves. Yainax was far less homogeneous. Near the subagency were the Upland Klamath and the Modoc, while some ten miles beyond lay Paiute Camp. With the beginning of stock raising, the fine grazing lands of the Upper End drew Klamath from the Agency side.[1] The Klamath Marsh settlements, formerly the area of densest concentration, had been abandoned as a winter residence in favor of warmer localities
about Upper Klamath Lake. Although O. C. Applegate later [731]
intimated the move was caused by losses from smallpox and other introduced diseases,[2] the general advantages of proximity to Agency and Fort may also have recommended it. Settlements on the Lower End now clustered about the Agency and upon the lower course of Williamson River. Only a scattering of houses extended along the Sprague as far as Lilu's seat at Kawumkan Springs, approximately ten miles above its mouth.[3] Beyond that point, almost thirty miles intervened between the two communities.

In their settlements, former foes were brought together: Peli- 657*
can Bay and other bands on the Williamson, Klamath and Wal- 648*
papi at Yainax. Band affiliations, which rested on kinship and 621
long association, continued to be strong for some time even within 619
the new settings. Thus members of the Pelican Bay band some- 177
times shared foodstuffs, and the claim that their parents stemmed 178
from the same tribelet long provided a bond strong enough to enable one person to borrow from another. By the end of the period, however, band identities had been largely relinquished as peoples intermingled. In their place developed ties of varying

*657 strengths reflecting emergent neighborhoods; common employ-
*648 ment at the Agency, or as freighters and as work crews; shared
621 church interests; and, with time, friendships formed at school.
619 The growing importance of the adjacent white settlements and
177 the administrative colonies at the Agency and at Yainax set in
• 178 relief the larger community of the Indian reservation.

*657 Klamath relationships with members of the Agency staff seem
*648 to have been restricted largely to those demanded by their official
duties. Their scanty numbers would in any case have made contact with them infrequent for the great body of the population, and the whites tended to maintain a closed community in their social relationships. An important exception to the general social insulation were some of the more acceptable members of the families of Indian employees, who were sometimes hired as help and thus received a conditional entrée to the houses of whites. Off the reservation, special protector-employer roles seem to have been assumed by such men as Sykes Worden, contractor and post trader at Fort Klamath, O. C. Applegate, and several others.

By far the most unhindered contacts were made at Fort Klamath. The freedom of the individual from social constraint in the early days is evinced in the situation John Meacham found.

> Certain Indian women [he remarked] . . . had established several habitations in the vicinity of the Agency. They were in the habit of hanging around the office, the quarters, private houses and other buildings of the Agency, losing no opportunity of insinuating themselves into the presence of the employes. They were saucy, impudent and lewd in the extreme.

He therefore placed the post off limits for women unless they had legitimate business, an order that "met with the hearty approval of the Indian men and the faithful observance of the women."[4] The practice was not stopped, however, and Dyar, who tried to institute a pass system to control the traffic, noted that "soldiers are in the habit of frequently visiting the Indian camps below this point—sometimes remaining over night."[5]

*657 Native marital practice posed no very great obstacle to a white
*648 who wished to consort with an Indian woman. In the nature of
563 things many of these unions were casual, but others possessed a
more permanent character, though often common law in form. Indignant settlers in the Klamath Valley circulated a petition in

balance, ascribed it to war and stated that in 1864, "the females 657*
were largely in the majority . . . a condition which continues . . . 648*
to this day."[13] 563
162

That the sources were indeed to be found in the conditions of native life is suggested by the circumstance that subsequently the imbalance was reduced: about 1875, the overall ratio was 0.72; while by the latter part of the period, from 1885 to 1906, it had reached an average of 0.87. It has since continued upward, to attain the approximate equality that characterizes the white neighbors of the Klamath.

Freed slaves constituted a second novel element in the popula- 657*
tion. Marriage to a slave had once been scorned, though Chief 648*
Chiloquin himself had married a Shasta slave; and even today 567
some stigma is attached to slave descent, albeit it is likely to be 178
brought up only as damaging gossip. Both sentimental family 177
attachments—a traditional attitude transcending acknowledged differences[14]—and recognition of the achievement of former slaves went far to ameliorate their position. One slave, Charlie Pitt, had been raised with his captor's son, Drummer David, in fraternal amity. The bond remained strong through life, and Charlie willed David his property when he died.[15] Another, one of three captured Pit River brothers, escaped to friendly whites who raised him in Ashland and gave him the distinguished name of Stonewall Jackson. In 1878 he returned to the Agency and the following year became a sawyer's apprentice. In recommending an increase in salary for him, Nickerson remarked that he "speaks the English language fluently, & is what may be called a civilized Indian." With several offers at better wages off the reservation, he wished to remain until he could qualify as a competent sawyer.[16] The best known of the slaves was Henry Jackson, whose rise has already been sketched. It is worth noting that he married the daughter of a Modoc chief, and that tribal members from over the reservation were not too proud to accept his bounty.

The altered social order was characterized by greatly in- 657*
creased mobility. An entire new range of opportunities was open 648*
to those who possessed or could develop new skills. Opportunity, 555
however, fell unequally, for the major new enterprises and posi- 177
tion in nineteenth-century America were masculine. As they were 178
incorporated into the regular activities of the Agency and within [562]

8

*657 the surrounding white neighborhood, the men came to take up
*648 roles narrowly and specifically defined in American terms and
555 to rephrase them in terms of their closest native counterparts.[17]
177 Thus, in the political field, judges and Indian police enlarged
• 178 the formal duties of office with some of the powers traditionally exerted by chiefs. Assimilation of roles, however, progressed in both directions; and in the end even relationships within Indian society upon the reservation were modified toward the American system. This was only partially the consequence of conscious imitation on the part of the Indians or of change directly instituted by the whites. In some measure, it came as the undesigned byplay of a modification made for another purpose.

*657 This, for example, was one of the effects of the educational
*648 system and its particular instrument, the boarding school. Be-
871 cause boarding school spanned the time of life upon which the
177 Klamath vision quest and the girls' puberty rite fell, those native
178 experiences were largely eliminated; and change of status was
[881] signaled instead by the final return from school. Education was designed for an altered future, but it increased intergenerational
[561] strife, as elders, their accumulated wisdom rendered obsolete in a changed setting, confronted youths skeptical in the superiority of their book-won knowledge. From the vantage of program, this was unfortunate—if inevitable—for the Agent depended for cooperation upon those same vexed adults.

To be sure, much of the change instituted might be regarded as supplementing and enlarging—rather than replacing—native content, for many a Klamath who was a schoolboy in those days today combines the learning of his elders with the lessons taught him in the schools. Participation in two orders juxtaposed for them made manifest the relativity of each one. For those youths, the new order was not to be taken on simple assertion; it had to demonstrate its superiority in a manner not required by those born into it.

*657 With all the changes that tended to distort the social order,
*648 women were less directly affected than were their husbands and
562 children. Their roles were still principally internal to the family,
177 as wife and mother; and though opportunities for employment
178 were beginning to open for them in the schools, their contacts with the ambient American culture were more fleeting and more

[Klamath Reservation]

K

657*
circumscribed. Because the step involved a wholesale commit- 648*
ment, those bold enough to marry whites, as already noted, 562
tended to pass out of reservation society. One or two women in 177
the early days sought to demonstrate they they could support 178 •
themselves as well as men were capable of doing, but they were
clearly exceptional.[18]

K
Confronted by shifting social values, tribesmen on the reserva- 657*
tion still could take assurance from a value acknowledged both 648*
by the whites and by their traditional culture. The high prestige 556
assigned to industry and to its material manifestation, wealth, 181
proved a common denominator upon which to rank the ability of 178
men engaged in new activities. In the new day, Plains garments, K
horses, and slaves were outmoded, and were replaced by a house [177]
and outbuildings, a fenced farm or ranch, wagons and buggies,
and plenty of livestock.

K
Within this context, the family also changed as movements 657*
within the reservation, the construction of smaller frame dwell- 648*
ings, and the cultivation of individual farms reduced household 592
size to approximately that of a single conjugal family. Some idea 177
of the shift may be gained by comparing subsistence rolls from 178
the administration of Lindsay Applegate[19] with data from the K
end of the period. A summary of issues made in 1872-73 to heads 657*
of families of Klamath, Modoc, and Yahuskin Snakes lists 54 648*
families totaling 658 persons. The majority were from Klamath 592
Marsh, with some from Link River and Sprague River bands and 162
several Modoc. One is possibly Paiute. The other two pages N M
duplicate some of the individuals, listing Schonchin's band of 657
Modoc, some eight "houses" comprising 97 individuals; Ocheho's 648
band of Warner Valley Paiute, 17 "houses" and 161 persons; 592
Chocktoot's band of Paiute, 13 "houses" and 113 persons; and 162
the Sprague River band of Monchnkasgitk, 8 "houses" and 97
individuals. A tally made in 1866 by one Jackson Jones (Link
River Jack ?), "Chief of Ulalona," lists for the Link River band
22 men, 18 boys, 42 women, and 20 girls in five houses.[20]

K
An analysis of these three lists reveals interesting facts about 657*
the contemporary social groupings. Where the two censuses over- 648*
lap, there is overall agreement, although the figures for individual 592
households differ slightly. For the census of the Klamath at 162
large, the average household size is approximately 12 persons,

*657 and this corresponds fairly closely with averages from the listing
*648 of Upper End bands. Only the Link River tally is aberrant, with
592 an average of about 20, far above the figure to be obtained from
162 those Link River households included in the census of the tribe at
large. Since the tally was made in September, it may reflect the
open living conditions of that season.[21]

*657 Household size ranges from 27 persons down to 2, the latter
*648 figure for the household of a widow. Households of known chiefs
592 —taking as criterion a signatory to the treaty of 1864—are well
622 above the average, ranging generally between 22 and 15, with
162 only those of the Modoc, Schonchin, and the Paiute, Ocheho,[22]
falling below. However, as will be seen, chiefly households were
not the largest in absolute figures: those of some of their followers
exceeded them. The large households indicated here
[178] point to the continued presence of the extended family as a
residential group.

*657 By contrast, the census of Slabtown, a small settlement near the
*648 Agency occupied primarily by Agency employees in 1901, shows
592 13 households comprising house head, wife, and from three
162 children down to none, with an average of 1.4. In one family a
girl past school age, and in another a grown son, were among the children. In addition to those children at home, the families had others in school, in the same numerical range and with the same average. The total family size ranged from 2 to 8, with an average of 4.7. Because some of the family heads, perhaps all, were young at this time, family size may thus have been somewhat skewed.[23] Nonetheless, the contrast of these households comprising conjugal families with those occupied by extended families forty years earlier clearly demonstrates the residential fractionation of the larger units.

*657 A seasonal mobility still characterized the Klamath family.
*648 Nickerson mentioned in 1884 that the heads of reservation families—from
166 one-half to two-thirds of the men—had been away for
the last four months, and added, "They generally take their families with them on such occasions."[24] Similarly, in a predecessor of Slabtown, over fifty families engaged in hauling logs on sleds to the sawmill camped in tents in January to be near their work.[25]

000 Of all the societal relationships, the government sought directly

[Klamath Reservation]

Of all the societal
relationships, the government sought directly
to change only those within the family. It was clear that a nation 657*
that was soon to impose upon the Mormons the American, and 648*
not the Biblical family, would permit no special marital practices 595
among the Indians. Polygamy was banned, although not retro- 177
actively for unions such as those of Allen David and Monchn- 178 •
kasgitk, which had been contracted prior to January 1, 1870.
Some leaders themselves appear to have advocated the change in
a desire to emulate whites. In 1877, Gatschet noted that there
were still two or three polygamous men.[26] Since polygamy had [556]
been a mark of the affluent, the ban, like the emancipation of the
slaves that preceded it, served to erode the status of the traditional chiefs.

An effort was also made to place under the authority of the 657*
court of chiefs certain relationships which had formerly been 648*
regulated privately between the families or individuals con- 622
cerned. In the legal code instituted when the court was estab- 692
lished, the consecration of marriage was made the function of 685
the head chief, to whom the groom was to pay a fee of five, three, 583
or two dollars or the same amount in horses, graduated according [643]
to his means. It was again the chiefs who punished fornication [684]
and polygamy and performed divorce.[27] The traditional ritual [586]
of marriage still was being practiced by some families in the 1890's[28] but the gift exchanges between the families concerned which set a public seal on the union were superseded, and the controls exerted by the family over the couple were thereby diminished. The effects of these and other changes were recognized by Gatschet. "Matrimonial reverses . . . among the Klamath [he declared] . . are one of the unavoidable consequences of the gradual emancipation of the females from the former rule of their brutal husbands through the advent of the whites, and also of the obnoxious and corrupting neighborhood of the soldiers at Fort Klamath."[29]

With time, the seal upon marriage came to be set by the 657*
Methodist church and its ethics in turn permitted the independ- 648*
ent of spirit to flout tradition. One woman recalled that upon 581
the death of her husband his family proposed that she wed his 587
brother in customary manner, but she refused out of regard for 177
the memory of her husband and the sanctity of the bond of their 178
marriage in the church.

*657 The removal of property interests in the marriage on the part
*648 of the natal families of the couple, together with the general
581 upheaval of society, brought to the fore the practice of common-
588 law marriage, previously an unusual form of union. In time, such
177 a marriage, if generally acknowledged as stable, was officially
• 178 termed an "Indian custom" marriage, and recognized by authorities and Indians alike. Many unions, however, were unstable, and genealogies reveal that then as now it was common to find individuals who had had as many as three mates. Indeed, the woman previously mentioned as refusing to marry her husband's brother subsequently consorted informally with her ranch foreman.

*659 Thus by the end of the period of its firmest control, the gov-
*648 ernment had altered the family in form to correspond to that
179 idealized in American society. It had done away with the special
593 status of slaves. Children were removed from the physical cus-
[567] tody of their parents and sent away to school, to be returned as adolescents at odds with the ways of their parents. These were individual measures, not calculated for their total impact. The approach to social, as to other aspects of change, was predicated upon the individual and upon the conjugal family. It failed to envisage the need to create bodies that would give strength and continuity to a reservation community.

NINE

[p.111]

Religion

THE FINAL FIELD OF PLANNED CHANGE TO BE COSIDERED IS THAT OF 657*
religion. The traditional American separation of church and 648*
state did not obtain in the early history of the reservation, which, 797
during the Grant administration, was entrusted to the Methodist Church. Several Agents, beginning with Dyar, and more than one employee, were ordained ministers. Although for some years the church did not send a missionary upon the reservation, religious services were held and the Word preached. The Annual Conference of the Methodist Church on several occasions served as a sounding board for intrigues on the part of white employees against the Agent.

Nor was religion divorced from political control on the native 657*
side. It will be recalled that shamans had been dominant figures 648*
before the rise of the centralizing chiefs, and that subsequently 756
their power often buttressed that of individual chiefs. The con- 178 •
tinued presence of that influence now challenged the rule of the Agent. Lindsay Applegate later, in his roughhewn spelling, characterized the "Indian doctor" as "the dangers imposter who was the grate Bareer aganst their siviliseation . . ." adding "I made him giv Back the property that he had taken from his people By his false pretences [.] when he got two Bissy I put him in the guard hose[.]"[1] Captain Knapp brought similar pressure to bear in an effort to remove interference with proposed medical innovations. John Meacham, who succeeded him, commented upon the futility of his drastic measures:

> This was well and the Captain deserves credit for it, but it had about as much effect in eradicating these superstitious notions from the minds of the Indians as would the execution of the Pope of Rome and the proscription of every priest in Christendom in abolishing from the earth the papal theory of religion.

> *657 To prevent a *practice* is one thing, to change the belief in the
> *648 theory which actuated that practice is quite another thing. Thus
> 756 while it is very true the *practice* of medicine by Indian doctors
> • 178 is abolished yet I am fully warranted in saying that there is not
> half a dozen Indians on the Reservation who are not as firm as ever in the belief of "spiritual medicine." Even Head Chief Allan David grave, sedate, and logical as he is in most things, acknowledged to me the other day that he *still believed* and was afraid to punish the Doctors.[2]

Notwithstanding his appreciation of the difficulty in eradicating belief in this way, Meacham continued to war against the shamans, causing Link River Doctor, whom Knapp had imprisoned, to be arrested and tried for having openly defied the order against shamanistic practice.[3] Meanwhile, he hailed the ministrations of the agency physician as demonstrating "that an efficient, patient and intelligent physician can do more than almost any other person in rooting out thier [sic] faith in thier own 'spiritual' medicine, and thus opening the way for the white man's customs, laws and religion."[4]

Not all shamans were initially singled out, for many were held in esteem. Of his paternal grand-aunt, a shaman, a present-day informant recalled, "She was like a preacher and all respected her. Chief Chiloquin always called her first when he had a meeting because she had a good brain. . . . Sally had a strong power
*657 [i.e. tutelary spirit]. . . ."[5] Tecumseh, an early Agency employee
*648 and Dave Hill's companion during the lyceum tour of 1875, was
756 a noted shaman. It was the parvenu chiefs, replacing Lileks and
754 Chiloquin, who abetted the Agents; and initially, as in the code
622 set forth by Dave Hill, their censure was directed only against
177 sorcery. Indeed, Hill's wife wrote him that she had taken their
178 ailing child to a female shaman to be cured.[6] As Henry Blow
remarked, "Since there is a white man's law among us the doctors are afraid to kill for malice or money as they did long ago, but exert the same power to heal the sick as they did."

*657 Significantly, when the court of chiefs tried Doctor John, a
*648 shaman, for having bewitched and thus slain another, the chief
756 witness against him was Sally, the woman shaman mentioned
622 above, who testifyed that in her dreams her shamanistic powers
177 had seen those of the accused.[7]

178 In 1880, Nickerson took a further step toward reducing the
[754] number of shamans, but thereby gave those who remained a

measure of official sanction. “I have recently induced their chiefs 657*
and people,” he reported, “to dispense with one half or more of 648*
their native doctors, each chief and his people selecting one to 756
retain. They came into this plan more readily than I had apprehended.”[8] 622
On a visit to the Agency, Lindsay Applegate came 178 •
upon the new system and, in a letter bristling with indignation, 177
wrote “[Nickerson] turned to me and remarked that they ware his indian docters that he had invited the indians to furnish to practice with his docter at the same time [.]”[9]

Meanwhile, the growing success of the medical program upon 657*
the reservation sapped the authority of the shamans in what was 648*
their last legitimate field. The personality of Dr. Royal, who had 756
doubled as chief of police, apparently did much to win over 164
some of the chiefs, as did his treatment of syphilitic cases among 177
the Indians. (Since, as Roork had remarked, the disease had been 178
contracted by Indians in the course of their annual trading trips to Oregon City and other points,[10] it may have had a higher incidence in chiefly families.) They desired to retain him and, wrote Nickerson in advocating this, “Should he remain permanently the chiefs have agreed to do all they can to do away with their Indian doctors. These Indian doctors have heretofore had almost unbounded sway over the people.”[11]

In outlawing shamanistic activities, the Agency in effect drove 657*
a wedge between the shaman and his ritual assistants: the inter- 648*
preter, caller, and singers. Since a curing seance was a public 756
demonstration, it involved too many participants to be concealed 177
easily; and the shamans, formerly among the most respected and 178
feared members of the tribe, were not given to skulking. More- [178]
over, in native theory, supernatural power waxes with use; and when performances were no longer given frequently, that power declined.

Recalled H. N.:

> I always seen David Hill go among the people and interpret the agent's words. Sally [the shaman] said, “I didn't do it myself, but my medicine do it. It's up to my medicine. If I do it, it's the medicine's fault.” But David Hill said, “It's better for you to quit than to have trouble for yourself, or your family. That's what the agent wants.”
>
> . . .
>
> Nobody ever called her after the orders were given. They might help minor things. I watched Sally. I watched her doctor.

K
*657
*648
756
177
• 178

> She worked all night once, and I thought there must be something to it. But her power got small. You know what the Christians say, "Backslide," not working strong enough. She said, "My help is getting small."[12]

Alec Wilson was a shaman, one of perhaps three in the lower Williamson River area. After the Agency had outlawed shamanistic curing, he gave up his practice. Later, his child fell ill. His wife railed at him, "You call yourself an Indian doctor! Why don't you do something? Can't you see your own child is dying?" Helplessly, he explained, "My tricks [i.e. powers] are all gone, have left me; I can't do nothing without my tricks."

Though prohibited, shamanistic activities continued into recent times. In 1897, Emery dealt severely with two instances of curing at Paiute Camp, awarding a month at hard labor each to Doctor Sam and Tom Godowa for attempting a shamanistic cure of the latter's daughter and a week in jail to Tom Chocktoot, headman of the Paiute, for a similar effort on behalf of Pete Pauline's daughter. Chocktoot had also to return the sack of flour and blanket he had received as his fee.[13] K [838] A number of adults who were products of the boarding school recall the transvestite shaman, White Cindy. One man was cured by him in the early 1890's;[14] and a woman who fell ill through dreaming of him underwent the required shamanistic cure, although she was a Methodist. Henry Jackson is said to have retained shamans to perform cures at his house, and he is widely suspected to have hired the assassin of the Modoc shaman, Doctor George, in 1899, on the suspicion that he had encompassed the death of his sons.[15]

177

While the campaign against the shamans was proceeding, other events had taken place. In 1871, a Paiute had introduced upon the Upper End (Yainax) the nativistic Ghost Dance religion; and Doctor George, at that time not yet a shaman, had brought it to the Tule Lake Modoc. There it was taken up by the Modoc shaman, Curley-haired Doctor, and played an ideological role during the Modoc War. A Klamath commoner named O'Toole brought the religion to the Lower End, at the Lakes, where a dance was organized by Allen David (then head chief), Lobert, a headman and shaman, O'Toole, and Frank Chilks, another commoner. No Agency employees among the Indians participated.

648*

After the end of the Modoc War, a second movement, the 657* Earthlodge Cult, was brought to the reservation by two Pit River 668 Indians, Henry Jackson and Pit River Charley, who had learned 177 about it while visiting relatives in northern California. Shortly 178 • after this cult was introduced, a delegation of Klamath and Modoc from both Ends of the reservation visited Falls City, California, and Fort Crook to witness dances and seek the "message." Gradually, the Earthlodge Cult passed into a second phase, known as the Dream Dance. At the Upper End, the leaders were again Doctor George and Monchnkasgitk, while at the Lower they included Allen David, Jason Howard, a commoner, Chanchan, a shaman from Pelican Bay, O'Toole, and Lobert. The Paiute abstained from both the earlier and the later phases of this cult. The movement effectively stopped about 1878 with the building of the Methodist Church.

Nash, whose account has been followed here, has set forth the ritual and the theological content of each movement and has convincingly analyzed the social tensions and individual drives, so far as they can be recovered, that gave significance to the movements. The Ghost Dance was given antiwhite content by the Tule Lake Modoc, but not by the other groups. The Earth- [184] lodge Cult, on the other hand, was strongly antiwhite at the Upper End, but not at the Agency. Around this time the Indians were becoming alarmed by reports that they were going to be exterminated by the troops and agitated by the boundary line and military road disputes, which especially affected the Upper End. Such fears may have contributed to the growth and local character of the Earthlodge Cult.

Viewed together, these movements constituted a progressive accommodation to the Klamath scene. As Nash characterizes it:

> The Ghost Dance represented a sharp break with Modoc and Klamath ritual tradition. The Earthlodge Cult was more in accord with this tradition, and the Dream Dance was still more consonant with it, and in the course of its development became incorporated into it. At the same time the aboriginal distinction [156] between the ritual experience of shamans and the ritual experience of nonshamans was broken down. Participants in the Dream Dance, particularly the strong dreamers, began acting like shamans; and shamans who participated in the Dream Dance acted more like ordinary men. . . . As the Dream Dance grew older, the traditional gap between shamans and non-

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648
*657
668
177 shamans widened again as ordinary people ceased dreaming,
• 178 and shamans incorporated Dream Dance symbols and practices
756 into their rituals.[16]

*648 While these nativistic movements were going on, the first steps
*657 were being taken to provide Christian training to replace the
797 native faith which was being discredited. In 1872, Thomas Pearne, an educated Indian from the Yakima reservation, had been appointed interpreter. During that year, until his resignation to return to Washington Territory in the following spring, he carried on missionary work among the Klamath, bringing
[622] thirty-six into the church. Among them was Lileks, who at his death three years later was numbered among the "Praying Indians."[17]

The following year, the Reverend James Harer was appointed Commissary at Yainax, where for a brief period he preached at religious meetings which were well attended.[18] By 1876, the Agent at the Lower End and the farmer at Yainax still were holding forth. Employees had volunteered to advance half the salary for a missionary if the Methodist Missionary Society would match the amount; but nothing came of it.[19] Roork, the following year, took a number of the principal men and women, along with some scholars from the Indian School, to the annual conference of the Methodist Episcopal Church in Salem, probably in another appeal for a missionary.[20]

The flavor of those early meetings is preserved in one of the letters to Dave Hill, dictated in 1875 by Allen David.

> After we had had our talk at the Agency I sent word for all the people to come to my house to talk about these things, and see who would agree to listen to what Dave, Tecumseh and I had said, and who would get our hearts and who would not. I told them to come on Sunday the Lord's day and we would all the same as mammook [make, hold] church, we would make good hearts and the Lord would mammook close nanish [take good care of] us on his day. So some Yainax Inds.—Brown Mosenkosket and some Modocs, some Lake Inds., some Chiloquin's people and some of all the Inds. came. Chikaskane first spoke and said that at first he had a bad heart. That the chiefs first listened to the Agents and got their hearts and then tried to get the other Inds. to get the same hearts; that they had put him in the guard house which was right, and Mr. Dyar was also right for he was in the wrong and all the same as said to the Chiefs

> *648 Make them better men and women." He was a Methodist
> *657 preacher and was a big man. He had a loud voice and was a
> 797 good singer. He was awfully strict. He didn't want the Indians to get into trouble. He said, "If you don't mind me, I will put you in jail or put a ball and chain on you." And he did. So the Indians behaved well, you know. I understood what he said, and it sounded good to me and after they interpreted his sermon in Klamath, the old Indians liked it too. Testimonies were then given. . . . The preacher read from the scriptures and made sermon. . . . He said, "I want people to come together and work together as one."[3]

*648 The emergence of native preachers provides another illustra-
*657 tion of the confrontation of native and American roles. From
793 the Indian viewpoint, the role of shaman did not coincide with
756 that of the American preacher, for in aboriginal times the sha-
177 man's duties had encompassed curative powers, and through
• 178 sorcery and counter-sorcery he had come to wield quasipolitical influence as well. Now healing lay within the duties of the Agency physician, while political sway had passed progressively, first to the raid-and-trade leaders and latterly to the Agency chiefs.

*648 On the other hand, points of resemblance existed between the
*657 traditional role of the chief and that of the preacher. The sermon,
793 the most distinctive and formal exercise of the minister, as the
622 Indian saw him, corresponded most closely with the exhortations
537 to a better life given by chiefs to followers and by elders to the
177 young. The correspondence of preaching with political authority
178 was furthered by the circumstance that a number of Agents had assumed the responsibility of preaching to the Indians. Among those realizing the linkage in their actions were Dave Hill and, to a lesser extent, Lileks, Allen David, and Henry Blow. Jesse Kirk, soon to become a preacher, later applied that office to political ends.

*648 In the Klamath view of the supernatural order, syncretism set
*657 in early, probably as the result of an Indian effort to reconcile
776 native and Christian belief. The trickster-transformer figure of
177 Gmukamps, known in myth by the epithets, "Earth-Maker" and
"The One Above," became identified by some with God, although
178 his trickster exploits led others to reject this. Within the first decade of reservation life, Christian dualism, seizing upon the first correspondence, became responsible for the coining of

another figure, known only as "The One Below," to represent the 648*
Devil. This figure appears in a Klamath version of the Garden 657*
of Eden recorded by Gatschet[29]—a tale no longer recalled today. 776
The identification of Gmukamps with God is strengthened in 177
Indian eyes by his mythical foster-parentage of the hero, Aisis. 178
As one Modoc, a fundamentalist preacher, has put it:

> you know, Gmukamps and Aisis—that's nothing but God and Jesus. The Indians knew the story of the Bible, but they were ignorant in those days. They thought that the lakes they performed their miracles around were the Klamath lakes; they didn't know it was really the Sea of Galilee.[30]

Looking back over the entire field of change from the last 657*
decades of the nineteenth century, the observer could discern 648*
major acculturative trends. The Klamath who entered upon the 177
treaty had already undergone pervasive, though largely un- 178
directed modification. Thereafter, they were subjected to a consistent policy of change which, despite defects in execution, outside interference, and an intervening war, was maintained for well over a generation. Within this frame, a reservation culture had taken shape, embodying a synthesis of white and Indian lifeways. By the middle of the next century, only a handful of tribesmen would be left who could report from direct knowledge events of pretreaty days; the remaining elders would be products of the synthesis.

Measured by the indexes which the Bureau employed to
register progress, the advance was evident. When that formula- [464]
tive period was ended, a large number of the Klamath were [511]
productively engaged in work of "civilized" character, and their
material wants had come to approximate those of their white
neighbors. Many were conversant, and a few literate, in English, [191]
and their numbers were increasing steadily. The extended family, [212]
at least among the progressive, had made way for the more [596]
mobile and assimilable conjugal family. In the schools, a new [594]
generation was being trained to embrace as natural and desirable [871]
a way of life which the Church, in turn, commended as good to old and young alike. Expectations seemed to lie within the grasp of those willing to work to achieve them.

Beneath the surface upon which these changes could be traced, [571]
however, lay cleavages and disconformities as yet unfathomed

*648 that were to threaten their success. Under the pressure of change,
*657 the Klamath had responded in diverse ways and had drawn
177 apart. A program addressed to a single people–if drawn from
• 178 several tribal cultures–had now to cope with a growing variety
571 of subgroups shaped by the acculturative experiences they had
undergone. Loosely structured as the native societies had been, they had nonetheless been clearly delimited. Participation in American culture now greatly extended their limits, and beyond the reservation the simple clarity of the social relationships they knew soon became distorted. As they participated in the life that went on beyond the reservation, the Klamath grew conscious of roles that not merely diverged from those of native society but at times were even lacking there.

In the new setting, expectations blossomed, on the part of whites as well as of the Indians, for which the reservation provided inadequate soil. A central goal in administrative planning was the inculcation of individualism, a characteristic ideal of American society of that day. The pursuit of self-interest must, however, have its limits; otherwise it trespasses upon the interests of others. Even in the days of the "robber barons" of nineteenth-century enterprise, American culture provided a context of value and structure within which individualism flourished, and which set limits upon untrammeled license. On the reservation, the creation of a similar context proved difficult indeed; it might even be said that the planners seemed unaware of the need to establish such restraints. As a result, they left the field free for the burgeoning of narrow self-interest.

Tribal society had been small in scale,[31] marked by scanty numbers and intensive face-to-face relations. Self-interest had been present here as well, but it had been subjected to major restraints by family and village. In transforming this society, the Agency had placed a premium upon explicit and formal controls exercised by its staff and by those Indians closely dependent upon it. A major characteristic of reservation society was the extent to which the Agency had become implicated in its being. Administrators, seeking to transform that society, strove to remove a strictly Klamath leadership as an intermediate variable in control, in the well-founded fear that such leaders might prove too independent. In so doing, they enlarged the gulf separating

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

political authority from the governed. The Klamath, in turn, became increasingly unresponsive to political control vested in an alien administration. Consequently, when the Agency later became aware of the need to limit the growth of rampant individualism, it no longer was heeded. Moreover, the dissolution of other restraining bodies had gone on apace, until at the end of the period of control there were left as social stabilizers only a weakened extended family, shifting neighborhoods, and the followings of popular, informal leaders.

On the threshold of allotment in severalty, with its further stress upon separatism, the prospect was not auspicious.

[P. 122 is blank]

share of the principal from the tribal fund, the per capitas, 648*
begun two years before, were flowing in from timber sales. By 657*
1926 they were $500 annually, and four years later had risen to 434
$700. Though they thereafter declined slightly, they rose again to 313
a figure in excess of $800. Acess to these funds gave the Indians a considerable measure of economic independence. A family of four, at the 1926 figure, received $2,000 from timber receipts alone, an income sufficient to provide for all their needs or to indulge some of their luxury cravings. Where "money talked," it afforded access to many areas previously closed. Having money gave at least partial emancipation from Agency surveillance. 648*

Indeed, from the days of allotment on, the growth of a money 657*
economy upon the reservation had been an emergent theme. 434
Amounts of money that Indians had been able to secure prior to 452
that time, though important in their economy, had not given them the same degree of independence as was later to be theirs. After allotment, anticipation of income from leasing and from other sources increased the volume of purchases on credit. To his [454]
knowledge, Emery reported in 1897, no Indian had funds deposited with the Agent or with any bank, firm, or person.[102] Although in the next few years O. C. Applegate transmitted checks drawn by a number of Indians to cover debts they had incurred, the practice was less a payment from accumulated savings than a convenience in handling money. What the correspondence strikingly shows was the practice of buying on expectation. Then as now risks were involved, and many individuals in the parlance of the day were rather difficult to "bring to time." That difficulty had sometimes to be surmounted by asking local men of property, such as Henry Jackson, to stand behind an impecunious would-be customer. At times the Agent exerted moral pressure upon a delinquent debtor, but under some conditions he declined to serve as collection agent. Repossession of property for nonpayment often ran against the jurisdictional barrier of the reservation line.

Along with access to individual real property went the transla- 648*
tion of traditional relationships into a more pecuniary idiom. Such 657*
tribal members as Robert Wilson and his wife, William Crawford, 178 •
and Jesse Kirk purchased insurance policies.[103] A number of 571 [177]
Indians hired farmhands, both white and Indian, instead of drawing exclusively or even principally upon kinsmen. [464]

*648
*657
429
• 178
571

ing exclusively or even principally upon kinsmen. A responsible man sometimes was appointed guardian of an estate, as was William Crawford in the case of the minor, Frederick Schonchin.[104] Indians sometimes volunteered to assume a somewhat analogous relationship even for nonkin. Thus William Ball, a prosperous interbreed, proposed to feed, clothe, and bury an aged and destitute couple from the Warm Springs reservation, "providing he can get their allotments to use while they live, and become the actual owner of their lands after death."[105] [591] As interpersonal relations became increasingly concerned with the manipulation of property, litigation in the tribal court gained volume and acerbity.[106]

*648
*657
423

The Board of Indian Commissioners had foreseen that undivided tribal funds might perpetuate the "Indian problem" that allotment had been designed to solve, and they advocated breaking them up.[107] Among the Klamath were a number of persons, stemming principally from the more acculturated members, who shared the same sentiments toward unallotted lands. Paralleling the stress upon individual pecuniary interests, they developed what may be termed claims against the tribal equity. In one instance, Celia DuFault, sister-in-law of William Crawford, and a nonresident member, claimed part of the Klamath school farm as her allotment;[108] in another, the returned Modoc, Charles S. Hood, made inquiries concerning the Yainax school farm with an eye, it was alleged, to a similar allotment for himself and his children.[109]

*648
*657
423
313

These efforts must be viewed in the context of corresponding measures on the part of whites. The conflicting claims and suits had delayed the completion of allotment, and hence the sale of surplus lands, into a time when it became obvious that the tribal timber possessed great value. The government then decided that the surplus lands would be retained and the timber exploited for the tribal benefit. There were various plans, however, to contest the retention on an undivided tribal equity. In 1909, the eight-man tribal council requested that a bill be prepared "giving the Klamath Allottees an additional 160 acres of timber land on this reservation; and that this be done at once in order that the surplus lands may then be disposed of otherwise."[110]

*648

423

Meanwhile, O. C. Applegate had remarked favorably upon a

[Klamath Reservation]

THIRTEEN

[P.185]

Modern Klamath: Demography and Economy

ALTHOUGH THEY LACK THE DRAMA OF CULTURAL CONFRONTATION, 648*
the years since the barriers of the reservation crumbled have 657*
been eventful ones for the Klamath, and deserve minute study. 619
The wealth of material makes such a treatment inappropriate, 177
and recommends instead a summary approach. Viewed as a 178
whole, a half-century of change has been marked by progression, with no major discontinuities. Geographically, physically, culturally, and socially, the Klamath lost special attributes they had once shared; yet, held together by a joint history, through participation in a tribal government, and by interest in a tribal estate held in common, they retained their identity as Klamath. This was a period in which, compared to the dominant society, the Klamath passed into a condition of reduced power, unable even to control the tribal assets save through a veto, constituting an ethnic minority in the communities where they resided, even within the reservation.

One of the indexes of latterday Klamath diversity has been 648*
their geographic distribution. At the turn of the century, approxi- 657*
mately ten per cent of the tribal membership resided off the reservation.[2] By 1955 the number had mounted to over forty per cent; and three years later, after termination, it exceeded fifty per cent of the Tribe. As had been true earlier, the absentee members were grouped concentrically about the reservation. Perhaps a quarter of their number resided within Klamath County in towns adjacent to the reservation. Outside the county, they were scattered throughout areas of southern Oregon and northern California where Klamath had long had ties. Along the

*648

*657 missiveness. Their ranches often took on the appearance of rural
464 slums, and were the scenes of drinking parties and brawls.
433 Economically profitable or not, ranching constituted the most
*233 common occupation for those who were employed. It offered special advantages. The land was usually an inherited allotment and, together with cattle and improvements, was often nontaxable. Outdoor work with livestock was a familiar activity; it permitted considerable latitude to the farmer in adjusting his routine. There was space to live.

*648 Whether dwelling in town or on a ranch, tribal members
*657 continued to seek native foods; but these activities had come to
433 occupy a different place in their lives. Men of all ages still fished
22 and hunted; many families still gathered huckleberries; and
262 elderly women at least continued to dig for the succulent roots
262 of ipos and camas and to gather wokas. The latter foods, how-
177 ever, were sought as cherished delicacies, now rare; while
178 journeys to the berry fields assumed the character of an outing. Much of the fishing had acquired a strongly sportive aspect and was carried on by angling. Only the spearing of mullet during the spring runs and the hunting of deer and waterfowl seriously served food demands. The larger game animals, which had figured in only a small way in Klamath diet and played a more important role among the Modoc, had become abundant upon the reservation as ranchers killed off predators. Tribal members often hunted them from a car or spotlighted them at night. Waterfowl were often shot as they sat upon the water. Fifteen deer would see a household through the year; and a number of Klamath families met all their meat requirements by hunting and fishing, being content to buy an occasional cut in town to add variety to their diet.

*648 "Meat hunting" thus continued to ignore sportive conventions,
*657 although fishing had in part given way to them. At the same
224 time, individual Klamath were wont to play with those conven-
224 tions by entering contests for the biggest buck or rainbow; and
226 they delighted in underscoring white failures to abide by their
181 own standards of sportsmanship. For the Klamath, hunting and fishing possessed particular virtue as an attribute of an Indian estate. The ability to pursue fish and game without regard to season was a signal right cherished by the Indians and valued

time, few years have not seen at least one murder upon the reservation. 648* 657* 674

Lesser crimes have also been frequent. Of the 1958 sample of the reservation population above the age of sixteen, no fewer than forty-three per cent had been arrested for misdemeanor, seventeen per cent for felony. Liquor had led to arrest for thirty-seven per cent, and no fewer than forty-nine per cent were judged to have problems associated with drinking. The corresponding figures were slightly higher for those members living in Chiloquin, where opportunity, observation, and arresting officers were all more frequent. 648* 657* 273 [674]

In situations in which other peoples have sought redress in religious movements or covert sorcery, Klamath have more commonly fallen back upon drink and violence. For them the bottle has proven a maladaptive instrument, as shown by a recent survey of the causes of death of 139 members who expired during a period of four and one-half years: drinking was adjudged to be a contributory factor in no fewer than fifty-seven per cent of the deaths.[9] The violence which often caps drinking bouts is likewise self-destructive: for it often strikes close friends or family members. [154] [765]

From the viewpoint of the city fathers, then, the Klamath have been an unruly segment of the citizenry; and the figures on law and order pose the difficulty confronting the community in the maintenance of an orderly life. Alternatively, however, those same figures represent a sizable income to be realized through the administration of the law. In the latter days of the reservation, as the Indians themselves were clearly aware,[10] the city seemed on the one hand to be profiting from the sale of beer and wine to tribal members and on the other to collect large fines from them when, under the influence of alcohol, they had fallen into the toils of the law. The implications of this policy, by which almost two-thirds of the income of the town was supplied, made many white citizens uneasy. The city fathers, concerned with a parsimonious administration, were not eager to seek a substitute and, indeed, any change would have presented obstacles.

So long as the tribal government remained to articulate their 648* 657* 178• 571

Family and School

WHITES AND KLAMATH ON THE RESERVATION RECOGNIZED IN FAMILY 648*
ties a bond that might be useful as well in formal enterprises. 657*
Several leading businesses in Chiloquin relied in part upon consanguinity 602
and upon marital ties to recruit members and ensure 178 •
continuity of control. Similarly, among the Klamath, during the bidding for tracts of tribal property in the course of termination, members characteristically acted in kin groups to undertake purchases that were beyond the resources of a single individual. In primary relations among both groups, visiting patterns and the occasional appearance of extended family households betokened the continued strength of ties reaching beyond the nuclear family.

For the whites who had come originally from outside the [167]
reservation, kinship ties stretched to distant places and there [563]
were comparatively few relatives close at hand. Of the whites in Chiloquin in 1950, although fifty-six per cent had moved from a previous residence in Oregon, fewer than forty per cent came from the reservation, from Klamath Falls, or from southwestern Oregon. Only a handful had raised children and in turn had seen grandchildren being reared in the town.[1]

The Klamath, with many kinsmen still upon the reservation, [587]
saw the network of relationship close at hand, however tangled
it might be by the intricacies of remarriage. To be sure, the [596]
extended family as a residential group was not prominent, for in Chiloquin there were but two such households and in Beatty one. The strength of the bonds manifested themselves in other ways. Tribal residents in the city of Springfield, in the Willamette Valley, several of whom asserted that they had originally moved away to escape the importunities of kinsmen, had made the move as nuclear families over a period of several decades. None-

*648 theless, analysis showed that they aggregated two extended
*657 families together with one other nuclear family unrelated to
602 either. The earlier arrivals had attracted relatives, but they had
178 been selective, encouraging some and in at least one instance
giving the cold shoulder to a kinsman deemed undesirable, when
he paid them an exploratory visit. For their part, they were
scrupulous in choosing compatible relatives to visit on their
occasional brief returns to the reservation.

[736] That kinship bonds, selectively utilized, were still in force is shown not only by such action as the bidding for tribal tracts, but in the assumption of responsibility for the care of children from a broken home. Although choice was exercised among relatives, and the uncongenial among close kindred might be passed over in favor of more distant, but more compatible, relations, the principle first evoked was that of consanguinity. In the majority of instances, primary reliance was placed upon parents and children, upon siblings, grandparents, and grandchildren.

*648 Among kinsmen, there was an enlargement of the sphere of
*657 individual, at the expense of common, property. At times it took
602 bizarre extremes. In one adult household, for example, each
421 member's foodstuffs were separately stored and even individually
177 cooked; and each independently purchased his supply of the
178 wood to be burned in a common stove. There was evident in
family interdependence what might be termed a pecuniarization
of relationships, a conversion of traditional reciprocal obligations
into the common denominator of coin. Already evident in the
early days of allotment, it had grown with time, taking on as it
did a onesidedness that was increasingly dysfunctional. Money
could be extracted by the importunate from kinsmen still sensi-
[888] tive to the charge of stinginess. The aged, dependent upon their
children for tenderness, were often likely to be besieged by their
requests for "loans" from lease and per capita checks, and once
those funds were dissipated, might then be left without enough
to maintain themselves. Some families, like the ranchers previously described, were beginning to resist such demands, but for
those still immersed in tribal society, refusal was difficult.

*648 The weakening of kin bonds entailed the disappearance of
*657 feud groups, entities that formerly had drawn principally upon
602
578
177
178

kinship loyalties and that had provided relatively stable focal 648*
interests about which allegiances might cluster. The anonymous 657*
destruction of property as a time-honored method of exacting 602
personal revenge remained even in the last days of the reserva- 578
tion, when the jacklight shooting of a cow was construed as the 178
malicious act of a foe. Distrust thus engendered was likely in 177
turn to lead to a search for potential allies, especially among kinsmen and cronies. Local legend in Chiloquin still recounts the memorable gunfight between two tribal families in the days before its incorporation, one firing from the railway depot while the other entrenched itself in the family hotel. At the first few shots the stationmaster, a newcomer to town, was flushed from the depot; and when the fusillades were stilled he left town, never to return.

As law and order became more firmly established over the reservation, and extended families, their members scattered on separate allotments and among the reservation towns, became
dispersed, retaliatory obligations declined. In the end, feudatory 648*
alignment left their mark chiefly in a continued reluctance of 657*
former opponents to drink together or otherwise associate. The 602
drinking cliques, with their stable membership cores, reflected 578
these antipathies: three decades after the gunfight mentioned 273
above, the families involved still did not consort together. Only 178
one person, and she an affinal, had crossed the line. 177
[573]

Indeed, the violence of more recent years, as remarked, lay far less between families than it did within them, for many of the quarrels that precipitated assaults arose in the course of drinking parties, and thus antagonized persons who were accustomed to associate together. Although there was a degree of mobility in the membership of such parties, and clashes at times might involve a visitor, many instances of homicide arose out of family disputes. That the tensions thus vented were generated by the changes in familial roles seems at least partially true, to judge by an examination of court cases; but they were affected indirectly by other segments of the psychosocial system, such as the relations with whites. Such disputes, however, could only weaken the family, and that at a time when family solidarity had become a less imperative need.

Within the reticulation of familial roles, the traditionally

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

Within the
*648 reticulation of familial roles, the traditionally
*657 esteemed attributes had lost place. Age was no longer accorded
561 respect, for the wisdom of experience seemed irrelevant under
593 the new conditions, and in the environing society the emphasis
577 was upon youthful qualities. The premium upon industry as an
434 ideal for old and young alike had become submerged by the
• 178 golden flow of per capitas which rewarded equally the wastrel
177 and the unremitting toiler. Remarked one man wryly, "I can make more money raising Klamath than I can raising cattle."[2] Under these changes, paternal authority had declined sharply. "Why should I listen to you?" demanded one adolescent son of his father. "I've got just as much money saved up [in a compulsory trust fund] as you have!"

*648 By contrast, the status of the mother within the household
*657 had been enhanced. Housekeeping and child rearing constituted
562 concrete activities that possessed a high measure of continuity
434 with the past, of a type normally respected in her counterpart
177 in white society. Access to her own per capitas had raised the
178 economic standing of a wife to a par with that of her husband.
[623] The relative changes in local roles, together with the passage
of woman's suffrage in the nation at large, had become reflected in the increasing prominence of women in the debates of the General Council.

*648 The major point of contrast between white and tribal house-
*657 holds on the reservation was the relatively greater fluidity among
563 the Klamath, as reflected in the record of sequent marriages,
58 the figures for common-law unions, and the broken families. In this respect, Beatty did not differ significantly from Chiloquin. Interethnic marriages—those between a Klamath and a nontribal partner—were more stable than those contracted between tribal members.

*648 Household composition makes it clear that the traditional
*657 valuation of kin had by no means been entirely relinquished.
592 In a number of instances, Klamath, particularly women, had
587 taken in the children of collateral kin. Remarriage produced
[178] composite families, in which the couple reared not only their own children but the offspring of previous unions of one or both partners.

*648 Consequently, Klamath households exhibited a diversity of
*657 form, size, and composition, frequently characterized as well by
592
593

the course of their employment by whites—to mention but one 648*
sphere—were even then associated in American society with 657*
inferior status, as involving largely manual labor. The course of 177
technological change tended to reduce those skills further in
prestige. The Klamath remaining upon the reservation generally
confined themselves to occupations of this level.

In these and similar contexts, tribal members entered into [464]
relationship with whites, both as coworkers and as employee or
rarely—as with Henry Jackson's hired hands—as employer. Within
this context, they had the opportunity to model behavior upon a
wide range of examples, and were not restricted to whites of
similar socioeconomic status. The Klamath girls who worked as
domestics in Klamath Falls at the turn of the century had many
opportunities to observe the life of middle-class families.

Yet individual change is only part of the picture, interwoven 648*
as it often is in the fabric of institutional change. In such a struc- 657*
ture as the Indian Shaker movement on the reservation are to 795
be seen the summation of a number of individual commitments 177
to a new creed, and thus the emergence of an institutionalized 178 •
consensus. For each participant, the commitment must have had
a highly individual significance, in the light of his condition and
belief prior to entering the sect. A brief résumé of the history of
that movement at Klamath will illustrate the complexity of the
factors surrounding institutional change.

The Indian Shaker movement had its inception on Puget Sound in 1882, but expanded vigorously only after a favorable court ruling a decade later.[12] A messianic faith, it incorporated elements of native belief and practice along with many aspects drawn from Catholic and Protestant Christianity. As it spread, it vied with and was influenced by other syncretic faiths as well as Christian sects, from which its converts and opponents came.

The Klamath church traces its origin to the East End leader, Henry Jackson, who had been instrumental in bringing the Earthlodge cult from northern California. Now, in 1914, forty years later, stricken with what was to prove his last illness, he turned his eyes northward, inspired by what he had heard from the unorganized local converts about the Shakers and their cures. When they declined to treat him themselves—perhaps the fate of the shaman, Dr. George, was still etched in their minds—he

*648 sent a mission to the Yakima reservation in the state of Washing-
*657 ton. The leaders who came down worked over him for some
795 time, but concluded that his case was hopeless; and indeed he
177 soon died. Notwithstanding this initial failure, the Shakers be-
• 178 came firmly established. A tribal member, one Stanley Pedro, offered them his dance hall and, drawing a parallel with the better known movement of Europe and the eastern United States, urged that the movement be named the Annie Lee religion. The church, located on the outskirts of Chiloquin, became a focal point from which influences subsequently fanned out to the Siletz reservation on the Oregon coast and to Smith and Klamath Rivers to the southwest. By the circumstance of its location, it drew members primarily from the Klamath proper of the Lower End.

The church met with no official threat. Gone was the day when an Agent might freely move against a religion of which he disapproved. Wrote the Acting Superintendent mildly in 1917, "They are somewhat fanatical and they indulge in some ceremonies that savor very much of ancient Indian customs but their creed contains some very good things. . . ."[13] He or a successor is said to have sent a member of the Indian police to observe the ceremonies, and the latter recalls that he reported with warm favor on the practices he witnessed.[14]

Several features are significant in the establishment of the church at Klamath. It came from other Indian groups along the Columbia which had previously been cultural donors, although the earlier cults received had come rather from the south. As adopted, the Shaker religion was seen as an Indian faith, its syncretism not acknowledged. Proponents thereafter came to underscore the uniqueness of its development by denying that native shamanistic elements or specifically Christian features lay at its core. At the same time, the freedom for inspired expression led converts at Klamath further to modify the received doctrine.
[153] Illness brought on through the agency of ghosts and the receipt of power through songs are but two such reinterpretations. Klamath communicants likewise differed in not eschewing coffee, normally forbidden in other congregations.

The growth did not take place in a vacuum. Such Pentecostal faiths as the Four Square Gospel were on the move soon after the church had come into being. In 1926, missionaries of that

sect were permitted to make temporary use of the Shaker church 648*
building until their own structure could be erected. Tribal mem- 657*
bers were drawn into entrant fundamentalist sects as well as the 795
Shaker faith, and on the occasion of revivals Shakers freely 177
visited their services. 178 •

Together with some of those sects, the Shaker faith embodied [787]
many of the demonstrative acts, in dramatized testimonial, visions, and the inspired state known as "the shakes," which had been largely abandoned by other churches that had become more staid with the passage of time. Its cures were the most spectacular demonstration of its power, and many of its converts came to it in this way. At the same time, it drew no very large membership: in 1925, Spier found only twenty Klamath thus affiliated. Any claim to the exclusive allegiance of members—an aspect of the Christian heritage—made heavy way against the broad tolerance in things religious characteristic of the Klamath.

The member of the Indian police who had found favorably for the Shakers was cured by them on another occasion, rang bells in the services, and even sparked a drive to improve the appearance of the church. With equal concern, he contributed heavily to the Four Square Gospel mission, which he felt was beneficial to the "coming generation." His formal affiliation continued with the Methodist Church, and he was often in attendance at the Williamson River Mission. Nor did commitment to Christianity dim his evident belief in the validity of aboriginal Klamath religion. In his mind, and the minds of many other elderly Klamath, there was no need to select narrowly and exclusively a single revelation of the divine order on earth.

The fundamentalist churches—the "emotional" churches, as 648*
they were disparagingly dubbed by some white Methodists in 657*
Chiloquin—appealed primarily to whites and ethnic minorities of 795
lower social status, and indeed participation in their services 563
was a factor weighed in status evaluation. Accordingly, these 177
sects brought tribal communicants into intimate contact with those components of the community, providing the basis for a certain degree of acculturation as well as of intermarriage. A few of the Mexican Interethnic unions stemmed from these associations, and at least one white Interethnic couple was regularly affiliated with the Negro church.

The Shaker church, however, was an ethnic church of some

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

648*

of tribal members held aloof, while some members were no more 657*
than "Sunday" or "holiday" Shakers, attending services only at 795
wide intervals. 177

That there was no single Klamath response to culture contact 648*
even upon the reservation, must now be abundantly clear. It is 657*
also true that tribal members are not to be found extended along 184
a single continuum of change. No typology satisfactorily pre- 177
serves the mosaiclike pattern of the accommodation they have 178 •
made. For the course, even of institutional change, is the product, not of the engagement of reified "cultures," but of the countless individual choices expressed before concrete alternatives and projected against past experience. In the successive role-relationships into which they have entered, the biographies of some elderly Klamath suggest that there may well have been for them an inner continuity, not unchanging, which provided in their life-way a reference and a means of self-identification.[15] For many younger tribal members, however, the range of possible identification has become greater, while coercive restraints have weakened; and their selection among behaviors may be so conditioned by factors in the immediate situation as to appear inconsistent from one time to the next. Cultural confusion may well have resulted in their failure to form a stable self-image.

A central characteristic of modern Klamath relationships has 648*
been termed, for want of a happier phrase, "permissive diver- 657*
sity."[16] By this is meant a condition offering the individual a wide 156
latitude of choice among multiple and optional alternatives, per- 177
mitted modes being not only broad in range but diffusely de- 178
limited. Analyses of Klamath myths[17] and of the ethnological record suggest that this state, which corresponds in large measure to the "loose structuring" of Embree,[18] was characteristic of aboriginal Klamath culture, but it may well have been enhanced in reservation times by the breakdown of native agencies of control and by those other developments fostering individualism. The roots of its continuity lie in conditions of child-rearing, already reviewed, as well as in the social transactions of adult life.

The corresponding qualities in the individual are equally clear. For many Klamath, the interpersonal distance is of considerable magnitude, and constitutes a wary, defensive response to the

*648 anticipation of rebuff. It may have as its corollary a diffuse self-
*657 image, since the subject lacks any consistent delineation of his
156 characteristics from the reactions of his fellows. For some, as
177 well, there is a sense that a stable reference to self through time
• 178 is lacking, since each fresh experience tends to define it anew.
For the majority of tribal members observed over a period of time, enduring reference groups in which one could claim membership were limited to such entities as "Klamath Indian." As Clifton has put it:

> Persons as psychologically isolated as the Klamath must work hard at the business of maintaining their position. They cannot be expected to contribute much in the way of specific demands on others (outside of occasional impulsive outbursts), and they value situations where specific demands are not made on them. We seem to be confronted with a human group whose members share a primary orientation toward living which is organized around the need to be left alone to their own devices as individuals.[10]

Permissive diversity has found an expression in the manner in which individuals have fused life-ways out of historically disparate elements. This was particularly striking among the older Klamath, who in their youth had participated actively in traditional Klamath culture. Some, indeed, pointed to the essential similarity of native ethic and of Christianity; but others found no need to justify their choice. Life for them possessed a meaning that was involved less in the cultural source of its elements than in the condition of their combination.

*648 One old friend, then bedridden and since deceased, may serve
*657 to illustrate the point. As a child she had lived in an earth-lodge
159 and witnessed her uncle, the shaman, Alec Wilson, performing
177 his cures. Later, as a young woman, she became ill when dream-
178 ing of a shaman, and recovered only when he had been forced to
156 treat her. The gathering of traditional foods and the weaving of
baskets had been part of her skills. A sweat lodge stood outside her cabin. She spoke Klamath and knew the native myths and songs.

Yet equally, she was a product of the Agency school and had worked at the military post of Fort Klamath. When she married, she wed her husband at the Methodist Mission. Together, they ranched together on Klamath Marsh, and with her daughter and

grandchildren, she was a familiar figure in boomtown Chiloquin. 648*
Cured by the Shakers, she almost joined the church, then changed 657*
her mind. From her bed, she discussed a life-way that was an 159
indissoluble blend of diverse elements integrated by their personal 178
import. When she narrated or discussed a Klamath myth, 177
her assimilation of a Christian ethic was evident in the delicate 156
manner in which she skirted obscene passages. In admonishing
her great-grandson, she spoke in the traditional manner, but in
English, the only tongue they shared. The English she spoke, like [191]
that of her boarding-school contemporaries, was likewise syncretic;
for it bore the impress of Klamath sound patterns and grammatical categorization.

Individuals such as she, often happy to escape from the gray 648*
reality of age into nostalgic memory, initially struck the observer 657*
as conservative when contrasted with the young people: the boys 156
in Levis, cowboy boots, and leather jackets, the girls in jeans and 177
plaid shirts, who spoke little or no Klamath, and who loitered 178
in the cafes of Chiloquin hanging on the heavy beat of the jukebox. Yet at most, such folk were old-fashioned, and still retained the tastes and inclinations of long habit. Their commitment was selective. Those who still liked to dig the roots known as ipos did so, not with an aboriginal digging stick, but with the more durable iron counterpart made years ago by the Agency blacksmith; and they traveled to and from the grounds, not on horseback, but in the most modern of automobiles.

If there were tribal members who wanted to have as little as possible to do with whites, they did not thereupon stop speaking English or give up their houses, cars, and radios to accomplish this. They continued to purchase food and other necessary items from white merchants. Indeed, their hostility might find short shrift from another Klamath who commanded more knowledge of the traditional lore and still recounted the old myths to her grandchildren, yet possessed many friends among the whites.

Clearly, there was at Klamath in the latter days of the reserva- 648*
tion no clearly distinguishable category of the "native-oriented," 657*
in the sense of a preferential adherence to the institutions of 177
native life. Deliberate retentions rather served as the diacriticals 178
marking an ethnic nationality.[20] The use of the Klamath language [191]
to signify an Indian estate was one marker. It might be used on

*648 formal occasions in the General Council in a demonstration of
*657 decorative oratory; and there it might also serve a speaker to
177 shut out a heckler who knew only English. In such a session, a
• 178 member in the audience, although fluent in English, might demand
191 the services of an interpreter for the purpose of underscoring his Indian status. Similar functions were served when Klamath was spoken in the presence of whites. The ability to shift from one language to another, or from one behavioral modality to another, was akin to the behavior which Polgar has described in the "biculturation" of Fox children.[21]

*648 In the latter days of the reservation, there were few occasions
*657 when tribal members came together for traditional events, and
177 the sessions of the General Council constituted the main remaining
178 tribal gathering. Such individuals as our old friend mentioned
623 above had their closest and most continuous relations with children
619 and grandchildren, who by no means shared their outlook.
571 On the occasional visits of their aged peers, these elders exchanged memories and expressed common concerns which were as much the product of the parallel roles they then performed in their respective families as of the time in which they had grown up.

*648 Such accommodation as there has been to American culture has
*657 not only changed through time with alterations in the state of
177 Klamath and American cultures; but at any single time, Klamath
178 have drawn diversely from what was available. Thus, the small
184 number of families in Chiloquin that have attained a measure of social acceptance by whites of middle or high status have done so by manifesting the appropriate life style. In so doing, unless they are able deftly to shift role-orientations, being now Klamath, now white, they have had to sacrifice close relations with their kin. "Some of my family I never see any more," remarked one such woman, "and I don't want to see them." They often forbade their children to play with undesirable tribal children. Insistence upon household neatness, fastidious emphasis upon personal cleanliness, punctuality, and adherence to self-standards usually accompanied these attitudes.

Inframodal behavior among Klamath in turn has by no means been random in form, but has approximated already established patterns in the dominant culture; often combining them in ways

that seem bizarre. In evading prohibition, as already noted, tribal 648*
members learned successively to operate stills, to patronize and 657*
to serve as bootleggers, and to drink alcoholic extracts. For local 177
roughs, the pug and the cowboy provided glamorous models; 178 •
and several youths ventured upon the hard trail of the profes- 184
sional boxer. [883]
Although cowboy hats and boots were still worn in the latter days of the reservation, they were giving way among this set to the ducktail haircut and the leather jacket. Drag racing and drinking were pursuits as common among tribal adolescents in Chiloquin as among their peers elsewhere. The intermittent use of marijuana cigarettes and an occasional Pachuco tattoo were evidence of the selective adoption of Inframodal practices.

As a category, the inframodal Klamath were often the immediate descendants of some of the elderly individuals already mentioned, dependent upon them for money once they had squandered their own funds, sometimes residing with them, sometimes "shacking up" in a separate household in a common-law union. They formed but one range of the main body of tribal members, among whom they found associates perhaps as often
as they did among their own sort. They did not habitually asso- [571]
ciate with Inframodal peers among other racial groups, but [573]
characteristically remained in small tribal cliques, of which the [273]
drinking groups were the chief stable expression.[22]

Those tribal members still on the reservation comprised a main body, upon which three lobes might be distinguished: the elders, the Inframodal, and those conformant to American standards. The latter alone had tended to become almost completely cut off from the major body of their fellow tribesmen, save for a few leaders, who had been able to keep the respect of both whites and Klamath. The remainder constituted a single society of strong egalitarian persuasions.

While recognizing that a single criterion must fail as a device 648*
for sorting out categories which are the product of such com- 657*
plexity, a first approximation was attempted in an analysis of the 177
records of a random sample of tribal members in Chiloquin.[23] As 178
sorting criteria, the subjects were first scaled against five some- 184
what overlapping entries involving behavior before the law. Then, 125
working symmetrically from the extremes of the scale, they were

*648 divided into three segments as nearly equal in size as possible.[24]
*657 The symmetrical cuts resulted in a Conformant segment, pre-
177 vailingly law-abiding in record, almost twice as large as the In-
•178 framodal category at the other end, which consisted of these
184 persons with the highest record of violations. The Intermediate
125 membership was slightly larger than that of the Conformant.[25]

The characteristics of each of these categories, when contrasted, tend to confirm statements made previously. Members of the Conformant segment were least Indian biologically and included the highest proportion of women. They seem to have come from comparatively smaller families and, with the Intermediate subjects, seem to have received far more adequate parental care than did the Inframodal category. Educational achievements are less distinctive, reflecting the compulsory nature of schooling on the reservation, but again the Inframodal segment lags behind the others in school grade completed. In the measure of engagement in business or ranching and in record of money management, the distinctions are decisive, with the Conformant category far outstripping its fellows and the Inframodal segment at the bottom. Finally, in both the percentage of those married and living with spouse and family as well as in the stability of residence the same order is seen.

In the second part of the study, the thirty Klamath subjects who had given Dr. Clifton responses to the Murray Thematic Apperception Test (TAT)[26] were assigned by judgment to the three segments, the protocols of each category being treated together by a method of analysis previously employed in examining Klamath mythology.[27] When all of the modern TAT segments were combined and contrasted with the myths, the responses were seen to reflect changes which had in fact taken place through time. Thus a trend toward a universalistic outlook
[602] was reflected, along with lessened attention to the ramifications
[594] of kinship, a reduction of the family itself to nuclear form, and
[554] a concurrent diversification of role relationships toward individ-
[571] uals acting impersonally as employer, policeman, doctor, or
teacher. A secularization of life may also be reflected by the scant consideration of religion in the modern protocols.

[571] When the modern TAT segments were compared, the Conform-
ant subjects were seen to place a strong emphasis upon support

given the family by neighbors as well as by the impersonal agents 648*
of society, while making little mention of any kinsmen beyond 657*
the immediate, two-generation family. Members of this category, 177
who objectively were least Indian genetically and who mani- 178
fested the highest measure of intermarriage with whites, were 184
the only ones to introduce racial comments in their responses. 125
This may well be taken as evidence of their sensitivity to a [571]
marginal condition. In treating intrafamilial roles, they saw a [829]
strong paternal figure (lacking in the protocols of the other two [593]
segments), but they viewed his authority as one against which the son repeatedly rebelled. Moreover, contrary to their own superior record of family stability, members of the Conformant category envisaged the marital bond as frequently threatened by feminine interlopers. Here again is an indication that the Conformant families, like the most acculturated among Vogt's Navaho veterans,[28] had achieved their condition only at the cost of gnawing anxiety.

By contrast, both of the remaining TAT segments tended to [602]
stress kinship, for in their protocols a greater reliance is placed upon grandparents and more remote kinsmen, with correspondingly less dependence upon friends, neighbors, or impersonal agents. Indeed, the Inframodal subjects tended to view the
latter with suspicion and outright hostility. In neither segment [593]
was the paternal role seen as prominent; and the mother instead occupied a central position, not disciplining, but strongly supporting her children. Sibling relations, which in the Conformant category had been seen as continuing through life, stood on a lower level among the intermediate subjects, who viewed the bond as existing only in childhood; and were negligible among the Inframodal segment. Similarly, the marital bond appeared to be conceived by Intermediate members as weak, being marked by a succession of casual liaisons, while the Inframodal saw strife between the couple, rather than outside interference, as disrupting the union.

By contrast with Conformant subjects, members of the other
two categories exhibited a far less realistic view of the conditions [829]
making possible achievement, but they did so in different ways. Those of the Intermediate segment seemed to see conformance as a necessary factor for success, although their behavioral record

*648 showed them in fact to be deficient here, and they made complex,
*657 conditional statements about it. They seemed uncertain about
177 the manner in which a prosperous life was to be achieved. The
• 178 scofflaw members of the Inframodal category, by contrast, saw
184 accomplishment as the result of individual strengths, rather than
125 of surrogate support. In this, having regard for their family form,
829 they may be regarded as fairly realistic; but attainment for them often took fantastic forms. One might say that they were content to play with the idea but were unprepared to put it into practice. In their treatment of crime and violence they took a realistic view, as against the Conformant subjects, who also gave it prominence, or the Intermediate category, who seldom discussed it; and they often saw them from the perspective of the violator. Conformant concern with crime and violence, by contrast, was coupled with the view that punishment, often involving remorse as well, was both merited and certain.

*648 Several general comments may be offered. In the first place, the
*657 Conformant subjects stand somewhat apart from members of
177 the other two categories in adherence to standards dominant
178 among whites. A matter of some note is the size of the group.
184 While the size of segments was determined by the purposes of the study, the impression is strong that a larger proportion of tribal members would seem to be attuned already to values honored in American society than have been accepted by their white peers. Social acceptance, from this point of view, has lagged behind the formation of acceptable attitudes.

There are reasons for this. On the one hand, a number of tribal members approve these attitudes as merely reflecting those of the traditional Klamath. Some of them, despite Conformant behavior, decline to choose white associates if it means giving up ties with Klamath kin and friends. Then, too, among whites the formation of acceptable attitudes and behavior must be accompanied by other qualifications, discussed earlier. Major white stereotypes, as can be seen, have been formed about behavior and attitudes found principally among the minority of Klamath who fall into the Inframodal segment, and these have been extended to characterize tribal members as a whole.

Finally, behavior of Inframodal type is more complex than may appear at first. It was present, in somewhat different form, in

aboriginal Klamath culture; it has assumed some of the aspects 648*
of criminal behavior among whites; and as already noted is 657*
turned against the institutions of the whites and the persons of 177
Klamath. If Inframodal individuals are seen as rejecting the 178
ambient culture, they spurn only selected parts of it; and they 184
might have rebelled in similar fashion had they lived in the
native society a century and a half earlier.

There is much that continues to link most tribal members together. The assessment of an earlier paper seems valid.

> An individual may act in a manner that both we and the Klamath define as anti-social. [571] Affected kinfolk may object, but their voice is muted and their efforts frequently null. Yet outside of the group immediately affected, the offender may find ready acceptance and even approval, so long as he has not violated the cultural standards of independence, of indifference to pain, danger, or personal inconvenience, of open-handed liberality, of steadfastness to a friend, and of a shrewd opportunism to others. But because there is now no homogeneous mode of behavior governing relations with members of social groups, and no effective coercive agent, Klamath behavior today probably departs more widely from the mode than it did in aboriginal times.[8]

Thus, in various ways the Klamath have come to be differentially distributed, even within the confines of one small reservation town. Members have become acculturated in behavior and attitude to varying degrees and in divergent directions. [563] Through intermarriage, they have come to manifest a range of biological features, some more acceptable than others to non-Klamath. Finally, they have come to be ranked by whites upon a social gradient, although as a whole they are assigned an inferior position. In turn, historical, cultural, ethnic, and social considerations have led most tribal members to eschew their placement and to maintain a life somewhat apart. A major factor in their sense of separateness is the identity accorded corporate image by the tribal government. The following chapter reviews that institution.

[Klamath Reservation]

*648 in the Klamath language.[15] In this setting, the chairman and
*657 principal leaders sought with great difficulty to operate under
646 Robert's Rules of Order. Council minutes record numerous in-
619 stances in which many of those present cast no vote.

In this, as in other political contexts, the observer could sense what some members admitted readily: a reluctance to commit themselves to decisions that might lead to dangerous consequences on either side. As in their dealings with the Agency, individuals accepted as a right what those controlling the executive had to offer, and declined to be bound thereby. Factional charge and innuendo had so sapped confidence in the Klamath leadership that interviews conducted in the course of termination revealed that all but one of the respondents (118 in all) favored a management plan administered by unknown trustees over an organization headed by their own members.[16]

It was not, however, factionalism alone that was at the root
• [178] of the uncertainty. The long dependence of individuals upon per
capitas, and the corresponding lack of experience in pursuing a livelihood, understandably enough made many wary of any change that might threaten the economic niche in which they dwelt. Moreover, on many of the more complex issues involving property their very lack of experience made them easily swayed
[666] by irrelevancies. Not infrequently, Seldon Kirk, when presiding
over a vote of the General Council, would query, "I wonder how many of you know what you were voting for?"—and, calling for a reballoting, would see the issue solidly reversed.

*648 If they were uncertain in the exercise of their power, tribal
*657 members nonetheless felt a strong need to display it. Real and
619 fancied acts of coercion had left a legacy of alienation, to which
the impersonal bureaucratic operation of the Agency only added. In a span during which tribal membership had done little more than double, the Agency staff had swelled from an early 5 members to an ultimate figure of 139, some twenty-five times as great. With expansion, the Agency program had become compartmentalized, each division taking on a life of its own and growing endlessly ramified. Bureaucratization, together with the frequent turnover in the upper echelons of administration, led to increasing impersonalization of relations. Subtly, the training of Klamath

EIGHTEEN

[P.259]

Conclusion

THE ADMINISTRATION OF THE KLAMATH TRIBE UNDER THE PROVISIONS 648*
of the Treaty of 1864 comprised a program of directed change, 657*
paralleling in its general features the relationships of the United 171
States government with diverse other Indian peoples. Because a common policy lay behind the administration of Indian affairs, the history that unfolded at Klamath was similar at many points to developments on other reservations. Since, however, unique characteristics of Klamath culture entered into the equation, and common events were locally mediated, that policy had different effects in execution.

Within the spectrum of American Indian cultures, it was important 648*
that the tribes brought upon the Klamath reservation 657*
were unacquainted with agriculture, but had some knowledge of, 241
and esteem for horse-herding; that while they lacked traditions 233
of large-scale political organization, they placed a premium upon 619
industry and the acquisition of material wealth. These attributes, 181
while by no means unique, were distinctive in their combination; 177
and they gain significance when seen from the perspective of 178
the policy objectives of the government. Similarly, the circumstance that many individuals had already undergone extensive acculturation beyond the Klamath country provided the early Agents with native allies already won over to the prospects of change.

Even the application of a common policy exhibited special 648*
features. Two instances should illustrate the point. The recognition 657*
of the tribal claim to a large domain, together with the [423]
retention of surplus lands after allotment, laid the basis for a [619]
corporate wealth equaled by only a few other reservation peoples. [434]
Later, the rejection of the Indian Reorganization Act during the Collier administration placed the Klamath among a minority of

Those same traits others[13] had held to be conservatively Ojibway; 648*
and marking their counterparts among Menominee and other 657*
peoples the Spindlers[14] propose to see in them a common survival 177
of psychological characteristics shared widely by American In- 156
dians. Underhill,[15] by contrast, accounts for the commonalty by 171
reference, like James, to experience in a shared situation, the
reservation.

These differences of interpretation are by no means irrecon-
cilable. The writer would agree with James[16] that "the genesis of [114]
the modern Indian self lies in the social processes that constitute
reservation life," but he would include among those processes
such relationships as may have survived in the peculiar cultural
environment furnished by the reservation.[17] Favored in persis- 648*
tence at Klamath have been generalized characteristics, rather 657*
than complex and specific traits. They have survived in part 156
because they are inculcated during childhood;[18] and the family, 177
within which child-rearing takes place, is one of the structures 178
that has retained distinctive qualities. They are sustained in the [571]
quality of primary relationships and are rooted in the individual,
often at an unconscious level.[19] As Spencer observes, "The diffuseness of the social structure may be regarded as a survival from the heritage of the past, while individual activity continues to be couched in essentially aboriginal terms."[20] Reservation existence has provided, however, an ever changing context—albeit somewhat sheltered from the rapidly changing environs—in response to which enduring features have undergone modification.

To take the quality of guarded restraint, which Clifton regards 648*
as characteristic of the personality configuration of modern Kla- 657*
math, one can indeed trace continuities with the past. In the 156
myths there are present themes of watchful waiting and the use 177
of subterfuge in dealing with strangers and foes, and a wary 178
reserve in conflict with affinals.[21] In traditional relationships, as 571
Spencer has shown, sub-rosa patterns of aggression characterized [538]
"hostility . . . driven underground" by public disapproval.[22] That covert revenge has persisted is evidenced by historic records of several murders, of such acts as the firing of a haystack in 1897, attributed by the victim in part to the perpetrators' "envy of his prosperity . . .";[23] and to modern incidents of the same nature. Today jealousy is frequently attributed to unspecified others,

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 usually Klamath by inference and to be identified only in part
*657 with feuding groups. It may well be that such a projection is an
156 indication in many modern Klamath of an alienation from their
177 own membership group. More central to the issue taken here,
• 178 however, is the probability that under the tensions of reservation
571 life guarded restraint, once restricted to a few role relationships, has become generalized to a much broader range of contexts, while at the same time it has grown to be a pervasive characteristic of Klamath personality.

*648 The modern situation at Klamath, with its measure of human
*657 disengagement, apathy, and generated hostility, may be interpreted
156 by some as justification for the abolition of the reservation
177 there and as an indictment of reservations everywhere. Such
178 conclusions are likely to be far too sweeping. The Klamath situation was a consequence of a reservation become a holding operation, with a program that had ground to a halt. Ironically, termination of the reservation was founded upon the premise that the Klamath had attained a successful level of integration with their white neighbors. It may not be concluded that problems have automatically been solved by the action taken; nor may it be maintained that other, less drastic steps, if taken in time, might not have proved more effective.

*648 For many Indian peoples reservations are a highly significant
*657 reality, constituting the only familiar homeland, the major continuity
171 with the past, the sole real property, and the principal token of the government's resolution to honor pledges made long ago. At the same time, chosen with an eye to native exploitation or to the needs of the small farm of the nineteenth century, they are often unfitted to support a population by current standards. They thus pose the dilemma embodied in schemes on the one hand for local development and on the other for the relocation of Indian families. Sweeping measures are inappropriate; each reservation merits consideration in its own terms. Yet it would be shortsighted to seek only for material advancement, essential though this is; for, as the Klamath instance shows, unless the program give men hope, they languish even in prosperity.

[p.339-B]

KLAMATH CHILDHOOD AND EDUCATION [1]

by

MARION PEARSALL

INTRODUCTION

128 culture, social and political organization are
not described here except in their effect on
124 education. Wherever particular items are men-
tioned, we specifically asked our informants for
a description, even though they had been de-
scribed in previous ethnographies. Such ac-
counts may thus be taken as corroborating
earlier evidence unless otherwise specified in
the text.

131 The Klamath reside in their old territory
in southern Oregon, but the aboriginal way of
178 life has long since disappeared. Today they are
241 farmers and ranchers, but a considerable part of
the earlier culture remains alive in the memo-
233 ries of a few oldsters. Our seven informants
(4 men and 3 women) were all in their late
178 seventies or eighties and had participated in
the last phases of the aboriginal culture as
115 children. It is regrettable that it was neces-
sary to reconstruct childhood training from the
reminiscences of elderly individuals. Doubtless
much of the material represents the ideal rather
than the actual pattern of education. The
ideals do, however, give a definite insight into
what was considered important in the upbringing
of children, whether these standards were always
maintained or not. Since there is little or
nothing in the early literature on this subject,
there is no way of comparing impressions re-
ceived from old people who are admittedly look-
ing back to "the good old days" with impressions
of objective eyewitnesses to the old ways as
they were really practiced.

BIRTH AND INFANCY

Barrenness is sometimes con-
sidered cause for divorce. Since the blame
842 seems to fall most commonly on the woman, her
husband's parents may suggest that he send her
586 away and get a wife who can provide him with
children. Ordinarily, though, the parents-in-
606 law are more lenient with a barren woman.
Most Klamath express a preference for boys. A
842 variety of reasons are offered, the most common
being that boys are less bother than girls.
"Girls are always getting into trouble, and you
just raise them for someone else because they go
off to their husbands when they get married."
Once the child is born, however, there seems to
be no special favoritism shown to boys. One

M K 343 plunges into the lake or a pool in the river or whatever water there may be at hand. This practice seems to have been medicinal. It was used as a habitual means of warding off disease as well as of curing it.

The second form of sweathouse was of similar size and construction except that it had a saddle roof which was covered with several inches of earth instead of a dome-shaped roof covered with matting. The door of this structure was placed at one end and was usually quite small. It was closed by a blanket or tule mat during the sweating.

There was no large "sweathouse" used for ceremonial purposes as in the Coast Range and Sierra Nevada region to the south. All ceremonies were held out of doors, chiefly in the summer.

IMPLEMENTS OF WAR.[8]

M K 411 The influence of the unusual environment in which the Klamath and Modoc live is also very noticeable in the implements made and used by them, particularly in the various devices for the capture of fish and water birds.

[171] The chief implements of war were the bow and arrow and a rather short javelin. The war bow was of the general type of the northwestern part of California, having a sinew back and sharply upcurved ends. The arrow was made in the ordinary manner, with light wood or cane shaft, hard wood foreshaft, and a moderately large obsidian, or sometimes flint, point.

The javelin or spear was fairly short. Its shaft was made of heavy wood. Its point, usually of obsidian, varied from two to [178] six inches in length. These javelins, like war bows and arrows, [756] are no longer in existence, though the obsidian heads are quite plentiful about old village and camp sites. They are now used [525] by medicine-men in doctoring, and also by gamblers, who place them under the large mats used for gambling to insure good luck, especially in the game called sakalis.

HUNTING IMPLEMENTS.

M K 224 The implements used in hunting animals were usually the bow and arrow. Ensnaring animals was little practiced by the

---

[8] The Klamath names of the various implements, etc., here described are given by Gatschet in his dictionary, *op. cit.*

STONE IMPLEMENTS.

412 Several forms of stone implements are quite commonly found
[262] among the Klamath. Most characteristic of these is the two-
horned muller (pl. 21, fig. 2), used with the flat, very thin metate
[324] in grinding wokas, the chief food of the region. The process of
grinding with these implements is shown in pl. 12, fig. 1. The
muller is held so that the horns or ears point from the operator
and the grinding is done on the stroke of the muller from the
operator, the stroke toward the operator being very light indeed.
[252] A second form of muller, described by informants, but not now
in use, has a loop instead of the two horns. No special cere-
monial or religious significance seems to be attached to either of
these forms. Another, very small metate and a small grinding
stone or muller (pl. 21, fig. 1) are employed in the grinding of
certain seeds which are parched and used as food. The motion in
grinding with the small muller is circular, not backward and
forward as in the case of the larger one. These small milling
implements are also used by girls as playthings in the grinding
of wokas and other seeds.

Small mortars and pestles are quite commonly used at the present time and are still made by the people of this region. They are used chiefly by old people whose teeth are poor, for grinding dried fish and meat, though they are also employed in grinding seeds. The pestles used with these mortars are more or less crude. Those shown in pl. 21, figs. 3 and 4 are exceptionally well fashioned. A typical mortar is shown in fig. 6 of the same plate.

Another special implement of stone is the maul (pl. 21, fig. 8).
This, unlike the pestle, is always made with a decided conical
form. It varies up to five inches or so in diameter, and is from
[313] six to perhaps ten inches in length. It was used in driving the
elkhorn and mountain-mahogany wedges which were employed
in splitting trees, particularly for canoe making, as has been
[178] already described. Neither the wedge nor any other elkhorn
227 implement is now to be found in this region. Grooved sinkers
of elliptical or triangular form are used on the gill net. One
of these triangular sinkers is shown in pl. 21, fig. 7.

M
K walked with the cradle on her back, it was bound down with a
piece of buckskin; and there was in some cases a harder material
304 used in connection with the buckskin, such as a small piece of
854 board, or a piece of willow basketry. These headbands were, of
course, properly padded to prevent actual injury to the child's
head, but the pressure was sufficient and was so adjusted that it
caused a decided flattening of both the front and back of the
M head. The younger generation has not been subjected to this
K cradle treatment and does not show the flattening, but among the
[178] older Klamath and Modoc the flattening is very pronounced.
M K Probably due to the influence of the Shoshonean peoples to the
854 east, the cradle board finds some use among the Lutuami, but the
177 woven tule and willow cradles are typical of the region.

M In addition to the various articles of dress mentioned in speak-
K ing of the uses of tule, the Klamath and Modoc make a belt
291 either from the fiber of the inner bark of certain trees or from
286 human hair. These are worn by the women in every-day dress.
287 Plate 17, fig. 7, shows one of these belts of fiber.

As a brush for dressing the hair the tail of the porcupine is
M used (pl. 22, fig. 2). Usually the longer spines are removed and
K the skin of the tail is then stuffed either with shredded tule or
302 with shredded sage-brush bark. In dressing the hair the brush
237 is drawn through it directly against the points of the spines,
which, as may be seen from the illustration, lie almost flat.

K As before mentioned the Klamath have many vegetable foods
262 in addition to the wokas. Most of these are derived from small
plants, but the pine furnishes one. The inner bark of some of
the species of pine is much esteemed as a food and there is a
[237] special implement used in taking it. This knife-like bone imple-
ment (pl. 22, fig. 5) is used in separating the inner from the
outer bark, and is usually made from a deer rib or from a rib
of one of the other large animals.

SUMMARY.

M The Klamath and Modoc people possess a specialized culture,
K due largely to the extensive use of tule in the making of houses,
285 basketry, and various utensils. The only baskets made of a
harder material are conical burden baskets, triangular sifters, a

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 175
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common 101
experience and status as Indian in contrast to White, the contemporary Klamath 177
may be considered as one people. This section consists of a sketch of today's
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the 162
reservation's population.

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 13
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological [184]
aspects of these water courses were essential to the aboriginal Klamath economy, [224]
as they are essential to the recreational hunting and fishing of the present
population, White or Klamath. [226]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly 648
White culture. For nearly a century they have maintained multiple loyalties:
to the Agency, which represents the Government, to the Tribe, which was an ar- [829]
tificial construct and has seldom been a viable corporate group, to the local
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet 178
in the same years the Klamath have also acquired and learned much, and it would
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-resi-
dence with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White [181]
men of the Klamath. Instead, there has developed a variant socio-cultural
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been trans- 648
ferred to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not
utilize these resources. These latter homesteads are little more than rural [241]
slums, the scenes of perennial drinking parties. For decades the timber indus- [511]
try has been the mainstay of the local economy, but relatively few Klamath have
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

White ethnic exclusiveness is reflected
in minimal Klamath participation in formal organizations, lodges, political 648
groups, scouts, and various clubs. Elite groups such as the Masons are exclusively 621
White, while the elite Methodist church contains a single Klamath 563
member. In the century of contact few Klamath have held elective office outside [575]
the tribal structure, and although a high percentage have registered, very
few vote in local, state, or national elections. The dual structure of local [794]
communities is best reflected in the sharp division of networks of friendships [666]
and home visiting, White on the one hand, Klamath on the other. Clearly, the [571]
place and role of the Klamath is a special one.

Their special status has numerous implications. For years, to obtain their [273]
drinking liquor the Klamath had to turn to bootleggers, a legal disability which [671]
was removed only in 1951. Local law enforcement has sometimes been difficult
due to dual or conflicting jurisdictions, and jurisdiction over major crimes
committed by Klamath was given over to the state of Oregon in 1953. The land [423]
holdings of Klamath property owners, because of their special status, are frequently [651]
tax exempt, as have been their per capita payments. Simultaneously,
the Klamath have exhibited little constructive concern with local affairs. As
was noted, their contribution to the community takes a special form. In Chiloquin [674]
during a typical year arrests of tribal members amounted to 70 percent of
the total, and they also paid 70 percent of all fines and forfeited bails and
performed 96 percent of all trustee labor (Stern & Swanson 1960). The wardship [178]
status has, however, suffered gradual attrition, and in 1954 the passage of
Public Law 587 began the final termination of federal supervision of the tribe, [657]
and the dissolution of the reservation.

Under PL 587 the Klamath were allowed the choice of remaining within a reconstituted 648
"Klamath Tribe," with a corporate structure and assets to be administered 657
by a trustee, or they had the choice of withdrawing and of receiving a 619
pro rata share of tribal assets. In a later election, about 77 percent of the
membership elected the latter, and chose to withdraw. However, the control of
the new "tribe's" assets and the fact that many persons who withdrew have been
designated as "in need of assistance" indicates that although federal supervision
has been ended, the control and intervention of Whites has not.

The separation of Whites and Klamath in local communities is by no means entirely 563
due to White attitudes of exclusiveness or to overt discrimination. Individual 619
Klamath have shown an equally noncommittal relationship to tribal affairs. Attendance
at tribal meetings has been very low in spite of numerous inducements such
as free bar-b-ques. In General Council meetings (and tribal affairs, generally) [665]
the conduct of business is marked by extensive and endemic factionalism, delays,
repetitious debate, failure to resolve or even to state issues, and pointless,
lingering sessions. Here is one place, outside of the telling of a ripe but [191]
dirty joke, that one may hear the Klamath language used; but it is used as a
tool to beat down an opposing tribal member who does not understand it. Though
the General Council and the Tribe are symbolic of a corporate separateness and
of a Klamath identity, this minimal participation and the distrust of the ability
of tribal leaders to manage the tribe's resources weakens them as systems of
action.

592
Klamath families are another important locus of loyalty and identification.
The household or domestic group itself averages about four members, but there
are many single male households and many domestic groups headed by women.
The latter is symptomatic of the instability of the marriage tie. Marriage, 581
in the legal sense, is itself approximated in frequency by common-law unions [588]
and more temporary "shack-jobs." Probably one-third of all Klamath women have

Grandma Williams: Female, Age 67

*159
Background Data

156 Understandably, it is difficult to find a match for a person like Weasel, particularly
in the instance of a woman who occupies a similar status. The few
593 Klamath women who were like Weasel were not available for testing. Grandma
William's position is that of the mother of a large, disorganized nuclear family
733 like Weasel's, one marked by excessive drinking, violence, and promiscuity.
83 She is a vigorous, hearty, earthy old woman who has borne eight children by
three husbands. She is once divorced and twice widowed, her first husband
587 having died after three years of marriage, her third after thirty-five. She
871 completed six years of school, all that was available when she was a girl, and
she has lived and visited for extended periods in Washington state, Missouri,
178 California, and Mexico.

657 Grandma William's mother was a traditional Klamath wife and mother, and her father
for years an Agency Indian policeman. In her words, both her family of orientation
464 and her family of procreation have had "bad luck." This bad luck consists of numerous
bouts with the law over acts of violence. Her father died in the Federal
penitentiary where he was serving a life sentence for murder. Several of her
sons have killed men in the past. One is reputed to have killed at least five,
and he is now in a State institution. Her other children are noted for their
violence, and local informants say of Grandma that they cannot understand how
such "a wonderful, good old lady managed to produce so many worthless children."
577 Few feel that she deserves such a fate. Community acceptance of Grandma Williams
is based upon several attributes, her steady, hard work, her commitment to raising
177 a family, her devoutly Christian behavior, her espousal of dominant White values,
and, especially, her hearty good humor. She has never accepted the guilt of
either her father or her sons, maintains that they were falsely accused, and
has worked steadily to secure her one son's pardon.

191 Grandma Williams was raised in a Klamath speaking household and acquired her
English in school. She is very proud of her education and maintains that children
871 today are not so well tutored in the 3 Rs as she was. She claims that "I
can just about out-spell, out-write, and out-figure all of my kids." This is by
593 no means the only aggressive, competitive attitude she maintains towards her
children, none of whom have ever quite lived up to her standards. In this respect,
603 Clifton was once able to witness her training a grandson, who was an alert,
spontaneous, active lad. The boy was made to be too polite and too formal, behaviors
867 in keeping perhaps with urban middle-class society, but very much out of
place on the reservation. All of her sons have maintained their main affiliations
with the local "cowboy" culture, but they are ridiculed for their efforts at
riding and calf roping because of their obesity and clumsyness, none of them
coming near, in physical type, to the slim hipped, pencil shaped cowboy ideal.
657 She is an excellent example of a woman who, early in the reservation period, was
carefully tutored by conscientious minister-teachers in inappropriate behaviors
871 and values, and who has attempted to transmit these to her children. It would
seem that she has produced over-trained, and mis-trained, hostile children, who
177 promptly discovered that regardless of their veneer of "culture" they were rejected
from many local circles because of their Indianness.

*159 Grandma is a direct, forceful person, another Klamath woman with a sharp wit
157 (yet a less personal one than Aunt May's). She is quick to initiate interchanges
and to attempt to knit together a strained situation. Yet her responses
156

121 with the values of the dominant culture and provide access to the institutiona-
156 lized means of attaining desired goals there will be a successful psychological
157 adaptation to dominant standards, but that when these conditions do not exist
then there may be overt change in the content of culture unaccompanied by changes
171 in psychological characteristics (Spindler 1955: 199). In the same way, Hallo-
177 well suggests that constant association with powerful external agents, multiple
conflicting sources of reward and punishment and the ridicule and invidious com-
parisons which too frequently accompany acculturation situations may result in
extreme feelings of insecurity, personality maladjustment, and what he calls the
"frustration of maturity" (Hallowell 1955: 329).

Spindler's dual hypotheses are, of course, not the only alternative consequences
of acculturation situations. We feel that between these polarities there are
different modes of adaptation open, modes similar to those suggested by Hallo-
[178] well. We therefore assert, hypothetically, that the defensive, guarded, re-
served style of interaction now characteristic of the Klamath is the product of
the deterioration and decay of major patterns of aboriginal Klamath culture, a
prolonged exposure to and considerable identification with the values and stan-
dards of the dominant White society, and the persistent denial of access to the
means and instrumentalities necessary to achieve these goals and to live up to
the standards. We argue, in this way, that there are a great many similarities
between diverse American Indian populations as noted by many observers, that
these similarities do not constitute the residue of generic Indian character
traits, but that they are a function of a common depressed minority group status
within contemporary American society. Our analysis of this is that these com-
ponents, specifically, the guardedness, the reserve, the suspicion, and the lack
of involvement in creative group activity, are very much analogous to what various
sociologists speak of as alienation or anomie (Merton 1957: 121-194; Nettler 1957;
Seeman 1961).

000 could not remain unpunished. Brought before a jury at Fort Klamath, Kíntpuash, Chief Skóntchish, Black or Húka Jim, and Boston Charley were condemned to the gallows and hung at the Fort October 3, 1873, while two accessories to the deed—Bántcho and Slū'lks (now George Denny)—were condemned to incarceration at Fort Alcatraz, San Francisco Bay.*

Thus ended the long-contested struggle of the little Modoc band against the Oregon and California volunteers and the regular troops of the United States Army. Certainly the heroism and ingenuity displayed by the Modocs would have been worthy of a better cause, and would have passed down to posterity in the brightest colors of patriotism had not the murderous "entreacte" and Canby's death deprived the struggle of its heroic luster. The unworthy termination of this war is well typified by the fact that the skeleton of the Modoc captain is now dangling as an anatomical specimen in the museum of the Surgeon-General's Office, at Washington, District of Columbia.

STATISTICS.

648
177
178
657
From the end of the Modoc war to the present year the condition of affairs has not changed much in the Klamath Highlands. The reports of the United States agent repeat the same story of progress towards civilization every year; but in view of the difficulty of bringing a hunter tribe into the high road of Christian culture and industrial progress we can not attach much credence to such reports so long as they are couched in generalities and do not contain special facts attesting mental improvement by schooling.

648
657
[241]
[231]
In agriculture success is possible only in the Sprague River Valley, but pasturing will succeed almost on every spot of the Reservation. The report of 1888, compared with that of 1880, shows a considerable improvement in this direction. The 2,500 horses and mules counted in 1880 had increased to 4,532 in 1888; the 200 head of cattle to 2,201. In the latter year the number of swine figured 208, of domestic fowl, 1,000. Of the 20,000 tillable acres of land 1,400 were cultivated by the Indians in

* Slū'lks was released, and stays now at the Modoc Reservation, Indian Territory, with Scarface Charley and some other warriors of that war.

000 on nature, physically and mentally, than we are. What distinguishes the civilized man from the primitive man of our days and of prehistoric ages is his greater faculty of turning to account the patent and the hidden powers of nature, or the invention of handicrafts, arts, and sciences. In this the savage man lags far behind the man of culture, and although we often have to admire the ingenuity and shrewdness displayed by the American native in his hunting and fishing implements and practices, the art of agriculture, without which there can be no real human culture, has never been pursued to any considerable extent by the Indians living north of the thirtieth parallel of latitude.

512 The climate of their home compels the Mák̲laks Indians to lead an
157 active and laborious life. Except in the coldest days of winter they are
[147] almost always engaged in some outdoor work, either hunting, fishing, or
cutting wood, gathering vegetal food, or traveling on horseback. Pursuits
like these and the pure, bracing air of the highlands render their constitutions
hardy and healthy, their minds active, wide awake, and intelligent.
They are quick-sighted and quick in their acts, but slow in expressing delight,
wonder, astonishment, or disgust at anything they see. Often they
do not grasp the meaning of what they observe being done by the white
people, and thus appear to us indifferent to many of the highest attainments
177 of modern culture. Children and adults are prone to reject or slow to adopt
[178] the blessings of civilization, because many of these are of no practical use
to a hunting and fishing people, and others are past their understanding.

The first things they generally adopt from the white people are the citizen's dress and handy articles of manufacture, as beads, tobacco, knives, guns, steel traps; also wagons and other vehicles; for when in possession of these last the horses, which they had obtained long before, can be put to better account. They are also quick in adopting English baptismal names, sometimes discarding but oftener retaining their descriptive or burlesque nomenclature from the Klamath language. Gradually they adopt also with the money of the white man the elements of arithmetic, and learn to compute days and months according to his calendar. After another lapse of time they introduce some of the white man's laws, discard polygamy and slavery,

773 times over them or by blowing at them, an act which is supposed to impart
776 life.

CONCLUDING WORDS.

128 The limited space allowed for this ethnographic sketch forces me to
suppress the larger part of the matter for the present and to relegate it to a
future volume. A few points characteristic of the two tribes may, however,
be added on the last page of this Report.

614 The Klamath Indians are absolutely ignorant of the gentile or clan
171 system as prevalent among the Haida, Tlingit, and the Eastern Indians of
582 North America. Matriarchate is also unknown among them; every one is
free to marry within or without the tribe, and the children inherit from the
595 father. Although polygamy is now abolished, the marriage tie is a rather
581 loose one. This tribe is the southernmost one of those that flatten their
304 infants' skulls, this practice continuing about one year only after birth.

764 Cremation of the dead has been abolished since 1868, though during
the Modoc war these Indians burned several of their dead. The custom of
suppressing the personal names of the dead is rigidly kept up at the present
178 time. Art never had any encouragement or votaries among the Klamaths,
769 and the only objects seen that could be regarded as art products were a
531 few rock paintings and a head-board on a grave near the Agency build-
532 ings, which was painted in the Haida style and represented a human face
flattened out to the right and left. Some baskets are artistically formed.
285 As there is no clay to be found on or near the reservation, pottery could
323 never become an art among these Indians. Their songs and poetry are also
artless, but nevertheless instructive, and several songs have beautiful tunes
533 that should be preserved. The musical and sonorous character of the lan-
538 guage fits it well for poetic composition; but a national poetry, to be of
success, would not have to adopt the rhyme as a metrical factor. Allitera-
tion, assonance, or the prosody of the ancients would be more suitable to
this upland language, with its arsis and thesis, than the artificial schemes
which poets are devising for the modern European tongues. Who will be
the first to teach the Muses the Klamath language?

NOTES.

178
837

Matrimonial reverses like the one given in this narrative are by no means uncommon among the Klamaths of the present day. They are one of the unavoidable consequences of the gradual emancipation of the females from the former rule of their brutal husbands through the advent of the whites, and also of the obnoxious and corrupting neighborhood of the soldiers at Fort Klamath.

NOTES.

[178] The ascetic performances and ceremonies here described are going into disuse at the present time. When they were fully observed, the bereaved husband wandered alone through the woods and wilds (spótu) for five days, but to the widow these observances extended over a shorter time. For this purpose both sexes wore warm clothing, but took to worn-out blankets or old articles of raiment, and used wisps of the serviceberry-bush as belts.

[192] [526] **83,** 1. shpótû: strong and unusual bodily exercise, running up hill, plunging etc. was and is still considered beneficial to the body, and is much in favor with the Indians. Cf. **82,** 10. 11.

[192] [193] **83,** 1. hissuáksûk for híshuaksh ak; the husband *alone*, not in company of others; pä'nē for pä'n a, pēn a, cf. átēnen for át a nen; and sē for sha, they, **82,** 4.

83, 2. ka-ítua pát or p'át: he eats nothing at the time while wandering; pánk, p'ánk might stand here instead of pát; tû'tahna: for dozing they did not lie down, but tried to catch a little sleep while walking and wandering.

83, 2. shlaá, and tchákēle **83,** 5, forms sometimes used in conversation instead of shläá, shleá; tchä'kēle, tchékēli. Cf. yáka for yä'ka, yéka: *Note* to **16,** 10.

83, 3. húshtí'ktamna; the suffix -tamna shows that pshín stands for nánuk pshí'n gí'sh: "nightly, every night."

83, 4. siunō'tish and shuí'sh are both tamánuash-songs, but of a different character. See Dictionary. Shlä'popka: he sees in his dreams what he has heard mentioned in the songs. To sing or repeat songs started by the conjurer devolves almost exclusively on the women present at the ceremony.

83, 5. súmat: into the mouth; their blood, disturbed by the constant excitement produced by the night rambles, ascends to the throat, and is sometimes spit out by them.

84, 2. shuashuáktchish. By their loud and noisy lamentations (shuáktcha, to cry, to weep) they expect to avert from the bereaved husband the effects of the tamánuash-spell (shuí'sh) which he has seen in his dreams.

84, 2. matchátgish: those listening to the words uttered by the conjurer and his repeater or expounder; they are of both sexes and also act as bewailers.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 773 192 193 103 137

94, 4. I-ulalónan or Yulalóna is the Indian name of the cascade of Link River above the town of Linkville, and for that town itself. The origin of this name is explained in 94, 5. 6, for the verb i-ulalóna means to move forth and back, referring here to the waters of the river receding under the pressure of the south wind.

94, 6. ítklank, partic. pres. of ítkal, means here: obtaining by basketfuls.

94, 9. The kĕnáwat is a plant growing high in the warm climate of Northern California, especially in the ancient habitat of the Shasti Indians, and in this myth it suggested itself to the Indians on account of its property of growing very fast.

95, 3. gé'hlapka: he swung himself into the nest by climbing over the rim. Cf. *Note* to 66, 13.

95, 10. kaiχema K'mukámtchish for the regular form K'mukámtchash. Cf. 91, 8.

95, 15. skáyamtch etc. More plainly expressed this sentence runs as follows: sha skáyamna pásh tchish ámbu tchish; the first tchish being placed before pásh and appended to the apocopated skáyamna.

95, 16. shéwana here used differently from tchíya, which applies to liquids only.

95, 17. p'lû' ítchuank seems to be a quite modern interpolation, for it smells of pomade and hair-oil; but it is as ancient as the myth itself.

765 95, 23. 96, 2. 3. 4. Tchíka. I have rendered this bird-name elsewhere by "Chaffinch," and Klétish by "Sandhill Crane".

551 96, 3. shlámia, to feel insulted. She resented it as an insult that the child called her deceased husband by name; for it was a capital crime among the ancestors of the present Klamaths to call a dead person's name for many years after his demise.

96, 5. hû'tna is changed to hû'tan on account of being followed by a word commencing with k.

765 96, 6. stiya. The custom of widows to put pitch or resin on their heads at the death of their husbands was abolished only at the time when cremation became a thing of the past.

178 96, 6. galdsha-ú̆yank is a more explicit form of the participle; the verb gáldshui being the contracted form of galdsháwi.

96, 8. yámnashla. He used the bristles of porcupines to make necklaces of.

96, 11. unakáka m'na was the son of Aíshish and of the above mentioned Tchíka.

96, 11. 12. K'mukámtcham qualifies pă'ks, not lúlukshtat.

96, 14. pakakóleshtka, verbal desiderative of pakakóla, to jerk away from. The suffix -óla indicates that K'múkamtch wore his tobacco-pipe tied to his body; he wore it on his neck.

96, 15. tchitchiks is used when speaking to children. It signifies *so, so!* and means: be quiet, shut up, stop!

96, 17. tchē'k kĕléwi. In similar connections this phrase very frequently ends a whole narrative in Modoc and Klamath. Here it means that Aíshish ceased to poke the pipe into the fire. Cf. 85, 10. 89, 7.

96, 18. medshá: he removed from that spot with all his wives and children. Ancient customs forbid the offspring to stay where the father had breathed his last.

96, 20. Gén hûnk nánuk etc. This portion of the myth describes the destruction of all the living organisms on earth by a general conflagration caused by K'múkamtch. Myths of this kind are suggested by intense heat experienced in summer. This mode of destroying life on earth is less frequently met with in myths than the drowning in a general flood.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

* 539 **148, 2–4.** Yánakänin for yanakänini; cf. suffix -ni, -nini in Dictionary. mä'nsh for
262 mä'ntch. pä'shtak for páhasht ak, cf. pä'sht, 147, 17. for páhasht.

824 **148, 5.** Nú'tak. This grass belongs to the genus Glycerium, as identified by Dr.
E. Foreman, and produces a tiny, grayish bright seed of tchípash size. The flowers
192 are of a light red color. The grass is found around the agency buildings and grows
about one foot high.

148, 7. Páwash properly means *tongue*.

148, 11. Pû'ks or *camass*. Its bulb is one of the principal food-articles of all the northwestern Indians, but does not grow in profusion in the warmer portions of California. It is of the magnitude of the walnut, very saccharine and nutritious, ripens in May and June, and by the roasting or baking process described in the text becomes as hard as stone. The Máklaks call it after pû'ka *to roast*, the Shasti name is sók, the Pit River name ähualé, while the name kamas, "sweet," is of Nutka origin. The botanists call the plant Scilla or Camassia esculenta. Cf. *Note* to 146, 1.

148, 14. ípakt, metathesis of ípkat, the conditional of ípka to lie there, to remain.

222 **148, 16.** púlχuantch. The gathering of this pupa or chrysalid and of its caterpillar,
462 the sχeshí'sh, is chiefly done by the women of the tribes, who find them imbedded at
252 no great depth in the sandy ground around pine trees. Another chrysalid, the kûlí'gs,
is collected and roasted by them in the same way and tastes like eggs. kshû'n puetílank: putting grass under the chrysalids, not under the heated stones. The stones are replaced by other heated ones, as soon as they have cooled off; the larva assumes a black color after roasting and tastes like eggs. See púlχuantch in Dictionary.

221 **148, 19.** guiχakshä'mighshta. The season of the year, when the exodus of the whole
222 tribe to Klamath Marsh takes place, where pond-lily seed is collected for the winter,
193 is about the middle of June. The ending -ta is an abbreviation of the case suffix -tat.
Three seasons are stated in the text, when the peeling of the inner or fibre bark of small pine trees is performed; of these the camass-season precedes the exodus to Klamath Marsh by a few weeks only, and the fishing season lasts from February to the end of the summer. Of course, the peeling of the kápka-pine coincides with the season when the sap ascends through the young tree. The bark is removed from about five feet to fifteen or twenty feet above the ground, and most of the beautiful pines treated in this manner are doomed to premature decay, though many survive the operation. The aspect of a forest with some of the pine trees peeled is rather singular.

148, 21. shánks hak, contraction of shánkish hak or ak.

149, 1. ka tánian for ka taniáni "so much in width or extent." The bud of the táksish has a width of about half an inch. Cf. *Note* to 146, 1.

149, 3. 4. tók. This aquatic grass grows about two feet high; by ó-ushtat is meant, here and in tsi'kal: Upper Klamath Lake.

194 **149, 3.** pä'lpali, vocalic dissimilation of pálpali or pä'lpäli; cf. taktä'kli 149, 14.

149, 5. Tchí'psam is a prairie grass on which the brown tchípash-seed grows.
This seed is extremely small, and it takes a long time before a sufficient quantity of it is
178 gathered to afford a meal for a family. Still smaller is the nútak-seed, and both are
striking instances of the persistence of the Indians in keeping up their old mode of living, when by agriculture and stock-raising they could procure provisions with infinitely less trouble and in much shorter time.

NATIVE MYTH AND MODERN RELIGION AMONG THE KLAMATH INDIANS

By Robert F. Spencer

773 IN A RECENT STUDY[1] of social change among the Klamath Indians 177 of southern Oregon, informants revealed an unformalized synthesis of 178 aboriginal and modern Christian religious beliefs. These involve, among [179] other ideas, an identification of the Klamath culture hero with personages in the Christian pantheon such as the God-Father, Jesus, and Satan. This is of interest since the contemporary Klamath have lost all formalized aspects of their older culture. The major institutions of the past have fallen by the way and, in their overt forms at least, have been replaced by those of the encroaching Anglo-American society. Acculturation is so far along that the observer [182] can elicit only covert survivals of aboriginal ideas. Although the tone of the folk culture has been lost by the Klamath, the reservation life, a common economy, and the wardship status enforced by external governmental agencies combine to effect a haphazard solidarity in the group. It is hence not surprising to discover a rephrasing of older values to meet modern situations. A case in point is the attempt by many tribal members, young and old, to find continuity in folklore and so to read Christian meaning into aboriginal myth.

175 Klamath culture of the past was not essentially different in its orientation 177 from that of many western tribes. Because the tribe was geographically marginal to several culture areas, it is possible to note the composite nature of its culture and to discern the realignment and reintegration of elements which [222] it shared with California, the Plateau-Basin, and the Northwest Coast. In [226] its overall configuration, the native culture differed from that of the adjacent gathering peoples because the Klamath had settled on the lakes and marshes [631] of the region and depended on fish and a wild water-lily. Beyond the basic [621] economic structure, however, one may note the California flavor of the separa- [771] tistic hamlets with their loose social and political organization; the weakly [791] developed (and possibly late) wealth complex, suggestive of the Northwest and the Oregon coast; and the formalized shamanistic religion which points to affinities with tribes in the Plateau, California, and elsewhere.[2]

---

[101] [122] [1] This paper is based on data collected during two summer field sessions, 1948 and 1949, on the Klamath Reservation. Field research was subsidized by grants no. 21 (Reserve Fund, 1947) and no. 1132 (1949) from the American Philosophical Society, Philadelphia, and by research funds from the Department of Anthropology, University of Minnesota, Minneapolis.

[113] [2] Cf. Leslie Spier, *Klamath Ethnography* (University of California Publications in American Archaeology and Ethnology, 30, Berkeley, 1930), 224-325; Verne F. Ray, *Cultural Relations in the Plateau of Northwestern America* (F. W. Hodge Anniversary Volume, III, Los Angeles,

771 reservation residents are not attracted. Like its more dramatic predecessors,
178 the Shaker religion fails as a bulwark against societal disorganization.

182 The modern Klamath are in the main nominally Christian. Many are
allied with local churches: Protestant groups attract a fair following; some
771 are Roman Catholics; others now and again join the itinerant Pentecostal
795 and Holiness groups. While many Klamath are unquestionably religious in
184 the accepted Christian sense, the church offers a primary social outlet to
797 those who value group association. Whatever the function of the church on
the reservation today, apparently it has no aboriginal vestiges in its ritual
571 or organization. It would be impossible to say to what extent tribal members
find a link with the native past in the spiritual curing practices of such bodies
as the Pentecostal Assemblies of God, which, however, clearly make no concessions
to aboriginal concepts.

771 It thus seems evident that the overt forms of tribal religion are gone. The
177 Klamath majority is now avowedly Christian even though church affiliation
is not universal. Religious attitudes seem highly diverse. Some individuals,
184 while indifferent to religious tenet, are admittedly attracted by the display
or by social opportunities. Some are devout, others ignore the churches entirely.
Still others, whether or not church members, speculate on religious
questions, show considerable introspective preoccupation, or are frankly
curious about native religion and Christianity. Their opinions and attitudes
755 demonstrate that the aboriginal past is not wholly dead. In this consideration,
757 shamanistic curing may be ruled out, since modern medicine is generally
accepted by the Klamath and, in any case, shamanistic patterns have merged
with the decaying Shaker Cult. Since this is so, the less formalized aspects
of the aboriginal religion survive to intrude now and again into modern conceptualization.

183 The survival of cosmological features may still be observed here and there.
773 For example, tales of people and animals turned to stone by Crow's laughter
are half-credulously recounted by young and old. A surviving custom or two,
183 reflecting the older world-view, might also be noted. A boy who kills his first
224 deer is well advised not to eat its meat himself. By giving the game away,
he averts failure in his next hunting expedition. Hunting on the reservation
today is a sport, no economic value being attached to it. (Aboriginally too,
the Klamath were so well adapted to their specialized lake-marsh economy
that hunting played a distinctly minor part.) This custom, which may stem
from the emphasis on wealth and generosity, is laughed down today but it is
825 still practised. Another very common belief is that animals can speak Klamath
191 but not English. A howling coyote is recognized by young and old as a harbinger
763 of death; the owl says, "'Maklaks, 'maklaks," which "when you hear
it, it means somebody close to you is going to die." The Klamath word means
183 human and refers to the tribe itself. Taboos on the first game of the hunter,
the first wild foods gathered, as well as fear of the owl are widely distributed
among western tribes.

178 But more pertinent here are the modern Klamath views based on the past
which either influence actual behavior or bridge a gap, conceptually, specu-

178 latively, or rationally, between past and present. There is good evidence
that the need for the power quest has not entirely disappeared, while on
the mythological side, notions concerning the culture hero Kemu'kemps often
recur.

787 The aboriginal power quest was highly formalized. Every Klamath, ap-
881 parently regardless of sex, sought power frequently. While puberty was
usually a starting point for these contacts with the supernatural, the power
785 obtained could be lost and might be sought again. A series of related concepts
existed: a sense of humility, fasting, a lonesome vigil, purification by sweating,
533 and other elements encountered among many Indian tribes. The Klamath
emphasized the inspirational song as evidence of the contact, and the word
/ɬuw'i·s/ meant spirit song, spirit power, or the spirit itself, depending on
787 context.[14] With the breakdown of the older culture, missionary activity from
177 without and the consequent imposition of new values, the formalized behavior
797 associated with the power quest fell away. But because it was highly in-
dividualized and unquestionably was an integrative factor in personality,
it was not wholly abandoned. Probably the nativistic movements, the Shakers,
the Pentecostalists, or the other emotional outlets permitted substitutions.
One cannot gauge how widely persistent is a sense of individual rapport with
the unseen world; certainly it is not discussed at the present time. The
examples cited here are essentially unintentional expressions of older in-
formants. Undoubtedly, these statements are an index to the emotions as-
sociated with the institutionalized aboriginal quest.

A paralytic woman, bedridden, aged about eighty, remarked as follows to me,
782 "Every day I pray to the mountain. I lie here in my bed and I am sick and
776 old and every morning I say to those mountains, I say, 'Bless me, help me.'
823 I pray just like my mother taught me to do. I ask the river to help me. I
774 say, 'River, help me; give me strength.' And I look over to that rock over
787 there and I get help. My mother taught me to pray to rocks and mountains
and to give some food to them before we eat. It's just like in the Bible. I
dream of those mountains at night. They kind of help you when you ask it."
She also recounts a visit to Crater Lake: "When I was young, I went up to
Crater Lake with a woman I knew. She tied my eyes and led my horse, up,
up. Then she said, 'Untie your eyes,' and I nearly fell off the horse. I saw a man
standing on the water far away, just like in the Bible. He scared me so. I
773 don't know who that was, but I like to think of that man now." The in-
formant refers here to the common Klamath myth of water beings, visions of
whom were apparently a significant part of the spirit quest.

Another older male informant gives a similar view of natural phenomena:
"When I was young, I used to hear my grandfather and father talking. They
said to me, 'You rustle around and get power; you pray to the rocks.' I never
did, but once I was sick and I tried it. 'Help me, I am sick,' I said. Oh, it
was good; they kind of made me feel good, them mountains did. Now I'm a
797 real Christian [a converted Shaker] and I pray to God and Christ. Those
things help you, but maybe it's the Devil that's working against God."

---

[14] Spier, 1930, pp. 94-100.

539* [222] (13) And having returned there, having filled the canoe, so having unloaded it, it is in just one place. (14) And it stays piled up there for a long time. (15) So it becomes dry on top, and rots underneath. (16) And perhaps they washed it, and all that was not good would float up to the surface. (17) And only the wokas sank to the bottom.

[251] (18) And they spread it out on a mat long ago. (19) And having spread it out there, so it dried out. (20) When it had dried, perhaps "three weeks"—(laughter)—three weeks having passed perhaps it has dried.

(21) And next they sift it well, until it is dry. (22) They do it all well, and they put it into sacks now. (23) And to make food, they parched it. (24) And at that time long ago they used parching-mats. (25) And having put coals on there, they roasted it, that wokas.

(26) And having roasted it well, they ground it with a muller. (27) Sitting spraddle-legged they ground wokas. (28) And then having finishe [516] that, they dipped it all to one side. (29) And all the chaff came up, on top. (30) And having put it to one side, they ground it again.

(31) And now they made food. (32) Long ago it was, before when our [178] • things, dishpans, were not there. (33) And at that time there they did it in a "čakía" [i.e., a type of basket], "čakía" as they termed it. (34) [415] And in that they first heated rocks, and they put the wokas into water. (35) Then they threw the stones into the water, in that "qalla" [another basket type], to boil it at that time, a [modern] boiling-pot being absent. (36) Thus they made wokas long ago.

(37) And that second kind, which I called "sbokẃas," they soured it apart. (38) And they took it off the top, while it was still wet. (39) Having gotten it ripe, they took it off the top. (40) And those were round, those "sbokẃas" were. (41) It was called "sbokẃas." (42) And again having ground that "sbokẃas," then again in just the same manner having put it in among coals next, they parched it. (43) Again they parched it. (44) They parched it, and it tasted good.

(45) And one other, that one being called "čini·q̓am." (46) It was not ripe wokas, and it tasted bad. (47) It was bitter, and they thus made it round, having parched it. (48) That's as much as they said.

[TEXT CONTINUED ON PAGE 131]

31. A Meteor

(Mrs. Pansy Ohles)

(1) The stars fall like rain. (2) And they covered me with a mat. 539*
(3) And on falling into the water [they made a sound] "čiW čiW"! 821
(4) And I peeked out from under. (5) And I was very much afraid.

32. A Funeral

(Miss Irene Skellock)

(1) When a person died, long ago they used to cremate him. (2) But 539*
recently they have not done thus, when I was small. (3) And there where 764
we lived, nearby a woman died. (4) And they gave things to each other. [178]
(5) They gave to us—a dishpan, a washpan. (6) And one man said, "Whatever they will give you [pl.], you [pl.] must give back likewise." (7) And we—did nothing—[did] not have any use for it. (8) However, we brought it back for him, the very same kind, just as they had given to us.

(9) Then we went there. (10) And we put flowers on for [the deceased?]. (11) And we went there—Sidaykedi. (12) And we slept on the ground, having arrived there. (13) Then those people sang all night. (14) But we did not understand anything of what they did. (15) We only heard them, they beat a drum. (16) And they [sang] thus, "ʔi···!" (17) Only that we heard there.

(18) Then early the next morning they took [the corpse] off to bury it. (19) And having arrived there, [at] the graveyard, then all the people took up a handful of earth. (20) And they having picked it up, they marched [past the grave], and threw it down into it. (21) And on finishing, then they now put all sorts of things on top [of the coffin]. (22) They put plates on, knives, spoons, forks. (23) And now having finished doing thus, then we went back down [the hill] to eat. (24) And now everyone went home. (25) The next morning everyone returned home, to Chiloquin.

[TEXT CONTINUED ON PAGE 147]

M
787 as their human instrument; by contrast in the Klamath phrasing
756 they are the shaman's "helpers."

K However differently they construe the degree of individual
M access to the sources of power, both peoples recognize that
787 human accomplishments are contingent upon it. Thus even those
K who have not secured a song appeal to the powers by prayer
M [782] in the sweathouse. Because success is seen as a reward for virtu-
[772] ous striving and likewise as a token of supernatural aid, the
universe appears basically to be a moral order.

K In human society, success has its outward manifestations. The
M annual round of the food quest, the unremitting demands of the
• 181 progression of plant and animal harvests, set a premium upon
461 industry. "Work hard, so that people will respect you," is a theme
that runs through the counsels of the elders and the periodic
K exhortations of headmen. The leading men are exemplars of this
M 461 virtue, and the wealth they have thus amassed permits them to
556 maintain several wives, while their generosity attracts a follow-
595 ing. Aboriginally, the difference between these men and the
K common tribesmen is less than it will presently become, yet a
M contrast is already apparent. Only the daughters of prominent
622 men undergo the most elaborate form of the puberty dance. In
556 war, a leader is chosen in part because of the lavishness of his
[881] panoply. After death, when the body is cremated, that of a man
[701] of property is likely to be decked with many valuables con-
[764] tributed by those wishing to honor his memory. In myth, the
[538] man of prowess is depicted as possessing shamanlike foreknowl-
[256] edge. These heroes do not bustle about their affairs but send
out emissaries on their business. Theirs is the restraint of power
in reserve, for when the time is ripe they move inexorably to
K the destruction of their foe. That quality is well delineated in
622 the deed recounted of the historic Klamath chief, Chiloquin:
539

> Old chief Chiloquin was quite a man, short but very strong. He was a *chief!* One time people were fighting; they were fighting all the time. *He* didn't care; he just slept there in his tent. Then about evening, he woke up. He says to his wife, "Bring me some water to wash my face." And when he had washed his face, he says, "Bring me some food and something—some coffee—to drink." And when he had eaten and drunk, he said, "Bring me my horse." And he took his weapons and got on his horse, and *all alone* he beat them. He was a wonderful man!

against a member of another band or tribe, but malevolence or greed, it is thought, may sometimes lead a shaman to compound the illness or death of a fellow bandsman; and sometimes his spirits may act independently of him to bring the same end. Klamath recall with horror the unnatural event which took place in the present decade of the present century, when that suspicion caused a woman to slay her own mother for the fatal bewitchment of her child.

K
M
754

682

To end a description of the aboriginal life of Klamath and Modoc in this manner is to risk too somber a balance. Loosely structured in society, modest in scale, precariously balanced against the winters, their cultures made possible a good life in which dignity and worth had a place. That those were not, however, the halcyon days sometimes depicted today is intimated by the words spoken in 1873 by the Klamath leader, Henry Blow. If they exaggerate as almost certainly they do, they still possess an essential truth:

K
M
181 •

K
181
829

> Before the Bostons came there was no law. The strongest man took what he wanted and the man who had the most property and the most friends was the chief. It was a bad country in those times. Some men were bad and took away the property of other men. If a man was poor and had no friends, and had a beautiful squaw, some stronger man would steal his squaw and kill him if he resisted." Might was right in those days and there was much fighting and killing everywhere. If a man was jealous because another was getting rich and had many friends, he would steal into his lodge and kill him when he was asleep, or lay in ambush to kill him as he went by. Those were bad times as we see now, since the Bostons have come and made law to protect every man's rights and property."

[Klamath Reservation]

K

circumscribed. Because the step involved a wholesale commitment, 657*
those bold enough to marry whites, as already noted, 648*
tended to pass out of reservation society. One or two women in 562
the early days sought to demonstrate they they could support 177
themselves as well as men were capable of doing, but they were 178
clearly exceptional.[18]

K
Confronted by shifting social values, tribesmen on the reservation 657*
still could take assurance from a value acknowledged both 648*
by the whites and by their traditional culture. The high prestige 556
assigned to industry and to its material manifestation, wealth, 181 •
proved a common denominator upon which to rank the ability of 178
men engaged in new activities. In the new day, Plains garments, K
horses, and slaves were outmoded, and were replaced by a house [177]
and outbuildings, a fenced farm or ranch, wagons and buggies,
and plenty of livestock.

K
Within this context, the family also changed as movements 657*
within the reservation, the construction of smaller frame dwellings, 648*
and the cultivation of individual farms reduced household 592
size to approximately that of a single conjugal family. Some idea 177
of the shift may be gained by comparing subsistence rolls from 178
the administration of Lindsay Applegate[19] with data from the K
end of the period. A summary of issues made in 1872-73 to heads 657*
of families of Klamath, Modoc, and Yahuskin Snakes lists 54 648*
families totaling 658 persons. The majority were from Klamath 592
Marsh, with some from Link River and Sprague River bands and 162
several Modoc. One is possibly Paiute. The other two pages K M
duplicate some of the individuals, listing Schonchin's band of 657
Modoc, some eight "houses" comprising 97 individuals; Ocheho's 648
band of Warner Valley Paiute, 17 "houses" and 161 persons; 592
Chocktoot's band of Paiute, 13 "houses" and 113 persons; and 162
the Sprague River band of Monchnkasgitk, 8 "houses" and 97
individuals. A tally made in 1866 by one Jackson Jones (Link
River Jack ?), "Chief of Ulalona," lists for the Link River band
22 men, 18 boys, 42 women, and 20 girls in five houses.[20]

An analysis of these three lists reveals interesting facts about K
the contemporary social groupings. Where the two censuses overlap, 657*
there is overall agreement, although the figures for individual 648*
households differ slightly. For the census of the Klamath at 592
large, the average household size is approximately 12 persons, 162

*648

*657 missiveness. Their ranches often took on the appearance of rural
464 slums, and were the scenes of drinking parties and brawls.
433 Economically profitable or not, ranching constituted the most
233 common occupation for those who were employed. It offered special advantages. The land was usually an inherited allotment and, together with cattle and improvements, was often nontaxable. Outdoor work with livestock was a familiar activity; it permitted considerable latitude to the farmer in adjusting his routine. There was space to live.

*648 Whether dwelling in town or on a ranch, tribal members
*657 continued to seek native foods; but these activities had come to
433 occupy a different place in their lives. Men of all ages still fished
22 and hunted; many families still gathered huckleberries; and elderly women at least continued to dig for the succulent roots
262 of ipos and camas and to gather wokas. The latter foods, how-
177 ever, were sought as cherished delicacies, now rare; while
178 journeys to the berry fields assumed the character of an outing. Much of the fishing had acquired a strongly sportive aspect and was carried on by angling. Only the spearing of mullet during the spring runs and the hunting of deer and waterfowl seriously served food demands. The larger game animals, which had figured in only a small way in Klamath diet and played a more important role among the Modoc, had become abundant upon the reservation as ranchers killed off predators. Tribal members often hunted them from a car or spotlighted them at night. Waterfowl were often shot as they sat upon the water. Fifteen deer would see a household through the year; and a number of Klamath families met all their meat requirements by hunting and fishing, being content to buy an occasional cut in town to add variety to their diet.

*648 "Meat hunting" thus continued to ignore sportive conventions,
*657 although fishing had in part given way to them. At the same
224 time, individual Klamath were wont to play with those conven-
tions by entering contests for the biggest buck or rainbow; and
226 they delighted in underscoring white failures to abide by their
• 181 own standards of sportsmanship. For the Klamath, hunting and fishing possessed particular virtue as an attribute of an Indian estate. The ability to pursue fish and game without regard to season was a signal right cherished by the Indians and valued

as well by envious whites. Indeed, prominent among the local 648*
advantages which white residents stated bound them to Chiloquin 657*
were the advantages offered by the reservation for hunting 224
and fishing. At the same time, the whites tended to regard those 226
pursuits as no more than recreational avocations; and if the 181 •
Klamath were sometimes credited with inherent aptitudes for
the chase, they were also looked down upon for devoting so
much time to "play," and for ignoring, as many did, the white
canons of sportsmanship.

Conflicting viewpoints were likewise evinced in the relationships 648*
of tribal members seen as consumers. While there were 657*
wide differences in actual behavior both among and between 571
whites and Indians, relationships came often to be governed by
stereotypes. This was particularly so in the larger communities, [621]
in instances in which individuals were not personally known to [184]
each other.

Those relationships were in fact strongly conditioned by the 648*
peculiar status of the tribal members who relied upon per capitas 657*
for their income. Few Klamath on the reservation had ever 434
banked money, and the absence of a bank in Chiloquin since the 571
depression, or in any other reservation town, made necessary 452
the institution of a credit system.[18] Since much Indian property [453]
was held in trust by the government, which thus could not be
advanced as security, merchants had to rely heavily upon a
knowledge of the individual in advancing credit. Reservation
stores resorted to a credit system to compete with the businesses
in Klamath Falls, and through a more intimate acquaintance
with tribal members could assess the risk more skillfully than
those—particularly the newcomers—in the county seat. At the
same time, the expense of operating such a system was one of
the factors in advancing prices in reservation stores. Thus merchants,
who not infrequently did their own private shopping in
Klamath Falls, were galled to see tribal customers, whom they
had carried on credit, patronizing competitors in the larger city
as soon as they had received their per capitas.

In attempting to collect outstanding debts, merchants could 648*
not count upon the Superintendents, but had to resort to moral 657*
suasion and threaten to cut off further credit. Some Superintendents 434
did assist in bringing pressure to bear upon delinquent 452

spectrum of the town they were ranked with alien Indians, and 648*
combined with Mexicans and Negroes. As such, they were people 657*
of color, and their conduct and low status were sometimes alike 563
regarded as the products of inherent deficiencies. A character so fixed upon the group made it still more difficult for the individual to rise upon the social scale.

The image of the Klamath that has been conjured up has been 648*
a complex one. Among whites, joke and anecdote have developed 657*
about varying attributes, as Klamath have been viewed, now as 563
romantic figures, now as naïve or degraded. In Chiloquin, it was 181 •
sometimes maintained that the Klamath proper, who made up much of the immediate Indian population, were inferior in character to the Modoc, who were both more remote—dwelling as they did on the Upper End—and had a war of resistance to their credit as well. Seen historically, romantic anecdotes began to gain local currency when Indian culture was a thing of the past and perspective had endowed with glamor the events of earlier days. The Klamath Falls *Express* spoke in this vein early in the twentieth century. Of one pathetic old lady living in a hovel on the outskirts of town, it observed, "Princess Matilda . . . [is] a full blood Klamath and royal Indian blood courses through her veins. Her brother was chief of the Link river band of Klamaths. . . ."[4] From the more general stereotype of the Indian were drawn the figures of the stoic hunter, the child of nature; the orator; the superior athlete; and the natural artist.

At times, the Klamath have been regarded as quaintly naïve, and some individuals have taken wry pleasure in fulfilling this expectation. The *Express* in 1907 carried an anecdote concerning William A. Moore, product of the reservation schools, former Indian judge, and later the owner of a hotel in Chiloquin. Moore was depicted as seeking to retrieve, and thus to nullify, the marriage license of a friend, the while saying, "Me want to buy him back; how much he cost?"[5]

Still other anecdotes painted the Klamath as dirty, immoral—"My children are *not* illegitimate," one woman was quoted as saying. "I know the father of each one!"—often a drunkard, violent, lazy, and improvident. "They say in Chiloquin," related the automobile editor of the Portland *Sunday Oregonian* in 1931, "that a popular promenade for the Indians scarcely takes them

*648 off Chocktoot Street; to the postoffice to get the government
*657 allowance [sic!] of $600 a year; to the bank to get the cash; to
563 the iceman around the corner; to parts unknown; and then to the
• 181 justice of the peace."[6]

There were several reasons why the views concerning the
*648 Klamath should become increasingly invidious with time. Al-
*657 though they had come to adopt most of the outward trappings
563 of American culture, those who remained on the reservation often
181 displayed a style of life at variance with that of white neighbors,
571 until some of the latter came to see the differences as innate. In
[167] Chiloquin, the influx of southern whites after World War II was said to have sharpened the stereotype: it seemed in fact to be maintained in less-qualified fashion among them. Antagonistic bias was least in evidence in Beatty, more strongly evinced in Chiloquin, and most apparent in Klamath Falls. Away from the reservation, Klamath tended to be absorbed in the larger category of American Indian, and to lose their special tribal identity.

*648 The impact of a felt discrimination was heightened for the
*657 Klamath by a sensitivity to slights in situations which whites
563 regarded as devoid of bias. Tribal members have been keenly
571 aware of the pairing of public equality and private bias. As one elderly and highly respected Klamath matron in Chiloquin saw it:

> The Four Hundred are those who live among the Indians but feel that they are better than the Indian. The [poorer] people are more fussy. . . . They will talk to the Indians on the street and are friendly when they want business, but otherwise they don't know them.[7]

Indeed, intimate social intercourse has been discouraged by both sides. Comparison of the names of whites mentioning tribal members in a sociometric test conducted in Chiloquin with those included in a census of Klamath drinking cliques ten years later revealed that only a handful of individuals crossed the social boundary. From a general standpoint, Klamath and whites were virtually exclusive in their intimate associations. Those few whites who drank with Klamath and named Klamath among their friends were low in the esteem of their peers. Among tribal members, individuals who consorted regularly with whites thereby

[Klamath Reservation]

EIGHTEEN

[P.259]

Conclusion

THE ADMINISTRATION OF THE KLAMATH TRIBE UNDER THE PROVISIONS 648*
of the Treaty of 1864 comprised a program of directed change, 657*
paralleling in its general features the relationships of the United 171
States government with diverse other Indian peoples. Because a common policy lay behind the administration of Indian affairs, the history that unfolded at Klamath was similar at many points to developments on other reservations. Since, however, unique characteristics of Klamath culture entered into the equation, and common events were locally mediated, that policy had different effects in execution.

Within the spectrum of American Indian cultures, it was im- 648*
portant that the tribes brought upon the Klamath reservation 657*
were unacquainted with agriculture, but had some knowledge of, 241
and esteem for horse-herding; that while they lacked traditions 233
of large-scale political organization, they placed a premium upon 619
industry and the acquisition of material wealth. These attributes, 181 •
while by no means unique, were distinctive in their combination; 177
and they gain significance when seen from the perspective of 178
the policy objectives of the government. Similarly, the circumstance that many individuals had already undergone extensive acculturation beyond the Klamath country provided the early Agents with native allies already won over to the prospects of change.

Even the application of a common policy exhibited special 648*
features. Two instances should illustrate the point. The recogni- 657*
tion of the tribal claim to a large domain, together with the [423]
retention of surplus lands after allotment, laid the basis for a [619]
corporate wealth equaled by only a few other reservation peoples. [434]
Later, the rejection of the Indian Reorganization Act during the Collier administration placed the Klamath among a minority of

121 had been founded. There was, for example, no evidence for anything remotely
181 approximating a "Native Oriented" group on the reservation. Moreover, it became
154 apparent that a particular style of personal adjustment was by no means
characteristic of the majority of individuals throughout their life-spans.
So called "Transitional" modes of adjustment, for example, might be used to
characterize the confused orientations, the value conflicts, and the disorganized
family life of persons early in their life arc, but the same persons frequently
settled down to a respectable, stable "Elite Acculturated" mode of existence
in middle age. Or this sequence might frequently be reversed.

125 However, the formal sampling approach was jettisoned primarily because of the
123 many refusals among the samples. That such a reaction might reflect important
variables and hence prejudice the reliability of the consequent approach was
considered, but it was apparent that the major cause for refusal was the absence
of an existing friendship relation between subjects and field-worker
(or some influential intermediary). Moreover, an analysis of the status of those
who refused indicated that this reaction was neither confined to nor clustered
within any identifiable grouping.

125 For these reasons, attention was given to securing what may be called a deliberately
representative sample of the reservation population. The criteria of
representativeness included variations in social roles assumed by the subjects
(occupation, sex, leadership, and so on), variations in role performance, differences
123 in standards and values, and age differences. When appropriate subjects
were known personally by the Anthropologist, they were approached directly.
If no friendship relation existed, potential subjects were, less frequently,
approached through the recommendations and aid of an intermediary, or, finally,
a direct effort was made to become acquainted with a suitable subject. In all
instances, an existing friend relationship proved the more successful mode of
approach. For reasons to be suggested in the next section, there are few Klamath
persons whose influence is both high and extensive, and, conversely, few who
123 can easily accept external imposition of controls. Thus intermediaries, whatever
their manifest status, rarely could elicit the cooperation of more than one
suitable subject. The result of this effort was a set of Rorschach and Thematic
Apperception Test Records, and short life-histories on a sample of fifty four
persons, which sample could for the purposes of the research be considered as
128 reasonably representative of the target population. The ten case studies in this
report were selected from the original sample so as to provide as much variety
as possible in the limited confines of these pages.

Aside from the problems of obtaining an adequately representative sample, there
is another aspect of the field method used in the Klamath study which may be of
123 some interest. In each instance the potential subject was made aware of the intentions
of the field worker and the purposes of testing and interviewing. It
181 will be clear from the next section that the contemporary Klamath are in no relevant
sense "primitive," nor are they an isolated population. Indeed. many subjects
125 were familiar with the "ink-blot" test from television programs, movies,
177 or hearsay information. More generally, the major task, that of identifying
ambiguous stimuli, was associated with the simple game of "seeing faces in the
clouds" or figures in rock formations. Further, most Klamath under fifty years
of age are sufficiently experienced in the practices of American culture to
have some personal familiarity with the "test situation," whether personality,
aptitude, vocational, or intelligence. Thus there was a shared basis for this
peculiar form of interaction.

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 175
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common 101
experience and status as Indian in contrast to White, the contemporary Klamath 177
may be considered as one people. This section consists of a sketch of today's
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the 162
reservation's population.

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 13
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological [184]
aspects of these water courses were essential to the aboriginal Klamath economy,
as they are essential to the recreational hunting and fishing of the present [224]
population, White or Klamath. [220]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly 648
White culture. For nearly a century they have maintained multiple loyalties:
to the Agency, which represents the Government, to the Tribe, which was an artificial [829]
construct and has seldom been a viable corporate group, to the local
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet 178
in the same years the Klamath have also acquired and learned much, and it would
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-residence
with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White [181]•
men of the Klamath. Instead, there has developed a variant socio-cultural
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been transferred 648
to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not
utilize these resources. These latter homesteads are little more than rural [241]
slums, the scenes of perennial drinking parties. For decades the timber industry
has been the mainstay of the local economy, but relatively few Klamath have [511]
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

648 Most Klamath live in one or another of the several
towns and settlements on the reservation, or else they have settled elsewhere,
361 in Portland, Salem, Eugene, in California, in Alaska, in the Midwest, or along
[167] the Atlantic seaboard. In 1955 the Tribe had 2118 members, and of these 40
percent lived away from the reservation (Stern & Swanson 1960). Partly because
[619] of the recent progress of the termination of federal supervision of the reservation,
by this date the percentage of members residing off the reservation has
[161] probably increased. In fact, for years there have been numerous "tribal members"
[619] with no experience whatsoever of reservation life.

648 Throughout the years of White contact inter-marriage and inter-breeding have
144 been frequent. Today, more than 70 percent of the Tribe's members are, genetically,
less than one-half "Indian," and less than one sixth are "full-bloods."
[171] Many are indistinguishable in appearance from their White neighbors, as most are
not easily distinguished in dress and language.

175 The isolation of the early reservation period was soon removed by the influx
177 of White settlers, who at first took up farms and started towns near the fringes
of the reservation. Through inter-marriage and through the consequences of
[361] allotment of land to individual Klamath, many Whites were soon residing within
the reservation's boundaries, either on the lands of a spouse, or on land bought
[423] or leased from tribal members. Another source of change were the ever present
efforts of Agency officials to make over aboriginal ways, and later, the rapid
[657] growth of the lumber industry and the development of full fledged frontier communities
were also important sources of acculturative influences. In quick
[726] succession the Klamath experienced a period of armed conflict (the Modoc War of
[786] 1872-73), a religious revivalistic movement such as that which swept the plains
area, extensive governmental planning and intervention, the allotment of land
in severalty, and a growing participation in the cash economy. Because aboriginal
[181] Klamath values had stressed achieved status for those who worked to accumulate
[556] wealth and property, for some Klamath the early period of contact provided increased
opportunities, and there was a group of men who for a time were effective
[436] entrepreneurs. It was through such personal efforts and through the "easy money"
had from private sales or the leasing of agricultural lands, from pro rata shares
of boundary settlements, and from per capita payments for sales of tribal timber
that the Klamath made the transition to a money economy.

648 The participation in and contribution of the Klamath to the economy of the region
is a significant point of interchange between Klamath and White, and one with
[313] many ramifications. In considerable measure, the local timber industry prospers
[423] or slumps, depending on the allotted cut in the tribal forest. Similarly,
local merchants are somewhat dependent upon the assured income of tribal members,
[434] as they are upon the purchases of mill workers, fallers, and cat-skinners.
The major town on the reservation, Chiloquin, obtains the largest share of its
[632] revenue from sales at a municipally owned beer-hall and from the fines and forfeited
[251] bails paid by visitors to the city jail, both of which establishments are
patronized largely by Klamath.

648 In other aspects of community life the participation of Klamath is perhaps best
621 characterized as that of passive spectators. Many Klamath have come to have a
sense of being aliens in the heterogeneous local culture, although there is a
563 small assimilated minority.

[591] Thus Klamath may interact as equals in card rooms and pool hall, and are met
with a stereotyped "friendliness" in interactions in stores and on the street.
However, the great majority live in intimate interdependence separate from the
main currents of White social life. White ethnic exclusiveness is reflected

581 Probably one-third of all Klamath women have
borne at least one child out of wedlock. At the same time, there is considerable
[848] out-marriage, and while Klamath and local White unions are not frequent, numerous
[563] tribal members have married off the reservation, to Whites, to other Indians,
and to other ethnic groups. With regard to common-law marriage, one occasionally
[588] hears a Klamath protest that such an unsanctioned union constitutes "Indian-style" marriage, but all evidence leads to the interpretation that the style
[177] is Twentieth century, not aboriginal.

602 Klamath family relationships are by no means limited to the household group,
but are sometimes extended to other consanguinal and affinal kin. Occasionally
596 there is sufficient integration and stability in these relationships to require
[591] notation of the existence of an extended family, but in all cases the bonds are
extremely loose, and the extended group is rarely a residential unit, which
[177] aboriginal Klamath extended families were. These are, thusly, de facto groupings
rather than de jure. They arise out of special needs and do not have sufficient
[626] status to involve prescribed behaviors. One of the striking cultural losses
is the organization of the co-residential extended family as an agent of social
control.

602 Generally, all kinship bonds are loose or permissive. Although the organization of nuclear families is tighter, frequently these groupings, too, are not
[594] co-residential units. All such kin groups are marked by the absence of obligatory responsibilities. Perhaps the household group is best represented as the
592 nearest collectivity to which an individual may turn when in need, with the
571 loose, extended group standing as the next nearest such collectivity. But there
are other groupings with similar functions, friendship networks, adolescent
peer groups, drinking cliques, and similar bonds in specialized role relationships
with local merchants, some of whom act as bankers, brokers, and bondsmen to
their own clientele.

593 Within the total kin network, perhaps the strongest, the most durable, and the
603 most influential ties are those between siblings, and between grandparents and
grandchildren. In some measure this reflects the structuring of the domestic
593 group. There the influence of the principal male is weak. The husband-
592 father frequently does not work, he may rarely be at home, and he seldom acts
as a disciplinarian. Whether or not there is a male attached to the household
[422] group, the wife-mother is usually the power figure. The character of domestic
relationships is suggested by the fact that several households, admittedly extreme cases, had kitchen shelves which were partitioned off by individual ownership of the foodstuffs each section contained, so much here belonging to Father,
that section being Mother's, and this over here the Son's. Thus even with regard to the canned goods needed for daily meals, there was no family property.
[181] Quite clearly, family organization is marked by extreme individuation.

593 One important antecedent of the character of these family bonds has been the
657 constant flow of per capita payments to all and sundry, to the most stable and
industrious and to the most delinquent. Controls over the expenditure of
434 children's funds by parents has been one important feature of these payments,
which although designed to prevent misuse of funds, have also acted so as to make
children more independent of family authority. Klamath children not only come
to feel that they are economically independent, but they feel that the source
of the funds is inexhaustible, and they flaunt their position in their parent's
faces. Additionally, the frequent absence of a stable male identification
figure within the family circle, a male tied to a job by value and need, has
thrown the burden of domestic responsibility upon Klamath women. This is a
serious source of strain in household groups.

Individuated family relationships and the instability of the marriage tie have 593
other ramifications. Parental care-taking activities are minimal and are sometimes 855
non-existent. Given the pattern of drinking and partying, children are [581]
frequently abandoned to the care of a hired baby-sitter for days at a time,
or to an older relative, or to an elder sibling. If the party occurs in the [181]
household, children may temporarily be moved elsewhere, or they may simply be
left to shift for themselves. Thus at crucial developmental stages children may
find their identification with parents broken by alternating periods of presence [603]
and absence, and their affections given over to an older sister (the picture of [155]
the determined little twelve or thirteen year old "child-nurse" is a clear one)
or to a grandmother. When parents are present, Klamath children are usually
faced not only with minimal care and attention, but with indifference and aloofness.
The father especially is dissociated from significant relationships, and
both he and the mother are frequently given to unpredictable and alternating
fits of love and anger. Thus within the nuclear family, there is little experience [155]
with consistency in role relationships.

Thus the first years of life are spent by the Klamath child in a loosely bonded, [602]
amorphous household group, and he has some lesser, but important ties to other
kin. At age six the Klamath child attends a local public school. Reflecting 872
the incohesiveness of the family group, these children are accustomed to lax, 861
permissive controls of their behavior, and are not accustomed to confronting clear
cut, specific, over-riding standards of conduct. At the same time they are not [593]
accustomed to maneuvering opposite a single, stable authority figure. Yet [181]
these children are characterized also by a dependent craving for affection and [155]
attention which does, initially, facilitate adjustment to the school milieu.
In contrast, they frequently anticipate rebuff. In later years the latter seems to
be the stronger inter-personal need, and the growing child becomes increasingly [156]
characterized by a kind of defensive isolation from close personal contacts.
This may be adequate training for participation in contemporary Klamath culture,
but it hampers and restricts adaptation to the larger society.

In many respects the values and skills learned within the household to not adequately 155
prepare the child even for school adjustment, with the requirement of 156
regularity and time-mindedness. Similarly, the daily routine within the household [871]
may be such as to impede the child's getting to school on time, or it may
throw the responsibility for attendance on very young children, or it may get
him there unfed and, by school standards, improperly clothed. At the same time
the child may have had recited for him, or he has surely overheard recounted,
the myth of Klamath racial inferiority. Too frequently this belief in inferiority
is assimilated as a segment of the growing child's self system, contributing
in turn to his acceptance of poor performance, to a bitter rebelliousness,
or to a destructive pride. The same experience reinforces the expectation
of rebuff, if this time somewhat more consciously. In fact, in later school [563]
years the Klamath adolescent does meet with informal racial barriers in the [582]
areas of courtship and dating, for the path to inter-marriage with local Whites
is not an easy one.

It is at this juncture, in early adolescence, that parental controls of the child 882
are almost totally relinquished. Made thus culturally independent, the child 156
may then enter high school and find that for the first time he has to compete 155
with his peers, for there are few social promotions in high school. Because he
is fully aware of his economic independence, and because of the other factors
cited, the pattern is for Klamath children then to find themselves propelled into
an adult status. The associated school phenomena at this juncture is a high [871]

882 155 drop out rate of Klamath adolescents, a slacking of attention, and a decline
156 in test performance and grades.

871 Something of the character of adult Klamath concerns and behaviors has already
156 been suggested. Many work in only a desultory, disinterested fashion, and it
is unusual for a Klamath woman to have a full-time job. Thus self-concepts are
[461] not so closely bound to job or profession as are those of local Whites. In
1953, for example, it was found that 65% of adult Klamath were wholly or partly
434 dependent upon per capita payments for their livelihood. Whereas the reluctance
[462] of Klamath women to take outside work reflects the pressures on them to remain
in the home and the extent of their responsibilities there, it also reflects
the fairly secure economic position resulting from the special benefits of
tribal membership. Aside from the twice-yearly per capita payments, these benefits
include the privilege of year round hunting and fishing, medical care, loan
services, tax exemptions on land and privileged employment rights at the Agency.
[464] On the other side of the coin, outside of the Agency, the principal local employers
are Whites, and for one reason or another they are very reluctant to hire
tribal members. In historical perspective, the development of tribal income paid
out in the form of per capita payments has paralleled the decline of Klamath
participation in the labor market. The contemporary Klamath do not work so often
nor do they work so steadily as did their parents and grandparents. There are
fewer Klamath loggers now than there were in the past, almost no business men now,
and fewer active ranchers and farmers.

434 In spite of shifting policies and personnel, the influence of the Klamath Agency
657 officials has been one of constant supervision over and intervention into the
affairs of Klamath individuals and groups. The controls over the expenditures
of children's funds was noted, and the same controls are exercised with respect
[241] to those tribal members who have been deemed incompetent. Yet the activities
of stable ranchers and farmers have also been supervised by extension workers,
[654] and efficient, prospering Klamath farmers complain that, with a good price decided
on and a buyer waiting, they have to await the approval of an extension worker.
Thus the adequacy of Klamath individuals is frequently in doubt, whether by experience
with a particular tribal member's high style of living, or by policy.
657 At the same time in many ways the Klamath have been protected from responsibility
for their own actions. Payment for debts incurred with local merchants is an
426 example, for the reservation being under federal jurisdiction, goods unpaid for
could not be repossessed, nor could income be garnisheed. As Stern and Swansen
phrase this situation, the Klamath have attained economic security "attended
by supervision."

657 Of course, through constant experience with Agency personnel and policy the
829 Klamath have learned that bureaucratic restrictions may be evaded or circumvented,
and they have long since acquired knowledge of the appropriate manner
of phrasing a request for funds or services. The Klamath complain of this that
forced contact with the Agency has made liars out of them.

648 In summary, little more than a century of contact has merged the originally
177 distinct Klamath, Modoc, and Paiute, and has altered them physically, culturally,
171 and personally. In spite of a small assimilated minority and a large off-
reservation population, the reservation Klamath exhibit a distinct way of life
657 which is novel if heterogeneous. This Klamath Reservation Culture is the
familiar context of everyday experience for contemporary tribal members. Thus
181 it is the source of what stability and security they know. No matter how variant,
or how disorganized this pattern of life may be, it is one whose outlines are
the consequence of the thousands of daily decisions, the many lines of action,

and the modes of behaving through which the Klamath interact with their behavioral milieu. For this reason it is not to be supposed that White exclusionism or Agency policy alone are the significant antecedents of the stable pluralism of reservation life. For a Klamath to leave the amorphous atmosphere of his home or the circle of his drinking pals to enter into the unfamiliar and unprepared-for activities of White life is a source of fear and anxiety. 181 657

Thus, however it may seem to the outsider, the existing way of life on the Klamath reservation offers substantial predictability to tribal members, a place to live, a corporate body with which to identify, and multiple stable human relationships. As a cultural system it may be stable in form although changing in detail, and therefore this novel set of human relationships is not likely to quickly disappear. [177] The Klamath today may not be the same persons who were settled on the reservation a century ago, and aboriginal Klamath, Modoc, and Paiute cultural attributes may have disappeared, yet they are still self-consciously Indian. [171] In studies of acculturation, it is frequently argued that groups like the Klamath are marginal, that is, hung suspended between two cultural worlds. 181 We feel that such a metaphor is both confusing and misleading. 657 It assumes the presence of a reasonably intact cultural alter of aboriginal design 121 and a unilineal path of acculturation process. As indicated above, the former is not present on the contemporary Klamath reservation. As to the latter, we argue that the structural consequences of acculturation are many, and a lineal assimilation process is only one of them. The Klamath situation, we feel, is that of an unassimilated minority group which is itself very actively engaged in maintaining its special position and which is subject to multiple external pressures for maintaining its present boundaries. The Klamath are, therefore, in a position analogous to religious and racial enclaves. They are a group distinct from and in some ways opposed to American culture who fit, as it were, into a special niche in the larger structure of American society. If the term marginality is to be used with reference to any Klamath individual it can only refer to his orientation towards conflicting reference groups in the heterogeneous contemporary community.

Section III. Approach to the Rorschach Protocols

121 125 The interpretive approach to the Rorschach protocols was dictated to a large extent by the overall purpose of the investigation. An avowedly inductive and idiographic study requires a broadly clinical, not a narrowly statistical, analysis of the obtained Rorschach responses. The conclusions reached on the basis of this kind of research may be considered hypotheses to be tested in controlled deductive research.

The validity of the Rorschach method for personality exploration is not at issue in the present study; there are obviously more clear-cut and efficient research methods available for that purpose. Rather, the test is being utilized as one means of gaining insights about the adaptive mechanisms of individuals in a particular sub-group that is undergoing an acculturation process — a case-study approach. These insights may lead hopefully to theoretical advances in that area of study called Culture and Personality.

121 From this statement of the general purpose of the research, several specific methodological decisions follow. It becomes clear immediately that there will be no comparisons of groups by statistical methods and few statistical tabulations of group means and standard deviations. There will be no description of that artificial construct — the modal Klamath personality. On the contrary,

121 125 [114] (Levine, 1960) has indicated that this may be an extremely important measure of ego strength. Whether this is supported in cross-cultural work remains to be determined.

121 15 The emphasis throughout this phase of the research has been on the functioning individual — how he adapts to his environment in general and, whenever possible, how he behaves in interpersonal situations. In this regard Piotrowski's hypothesis that the movement responses reflect prototypal roles has been exploited extensively. By prototypal roles, Piotrowski means, "definite tendencies, deeply embedded in the subject and not easily modified, to assume repeatedly the same attitude or attitudes in dealing with others when matters felt to be important and personal are involved." (Piotrowski, 1957, p. 141). He makes it clear that he is referring to "psychological tendencies" only; in order to predict whether these tendencies will be expressed in overt behavior it is necessary to take into account many other variables (Principle of Interdependence of Components).

Piotrowski has written further that the FM (animal movement responses) reflect the subject's prototypal roles as they were prominent in the subject's past or as they influence his behavior in "states of lowered integration and in states of diminished consciousness and defective self-control," and, finally, that the m (inanimate movement responses) "indicate prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable."

Thus, for example, if a subject gives only very active or aggressive human movement responses (e.g., "two boxers slugging it out") it is hypothesized that his prototypal role is of this nature. If his FM are passive and his M are aggressive, we conclude that his present prototypal role is aggressive, but that when drunk, for example, he is more likely to become docile.

In actual Rorschach interpretation the complexities of multiple roles, the influence of other Rorschach variables, the inconsistency of role patterns, and so on, must all be evaluated very carefully in order to arrive at a meaningful
121 and valid personality description. Although considerable care must be taken to
181 avoid oversimplifying these interpretive principles, their judicious application
156 is often very helpful and may have led to the most important conclusion of the present investigation: that the Klamath are characterized by a guarded and
[171] restrained approach to life and interpersonal relations. This guarded restraint is different from the Trukese blocking and from the dull apathy of the Alorese. The Klamath initial reaction times are not nearly as long as the Trukese, nor are their dark shading responses as primitive and poorly organized. On the contrary, their initial reaction times are only slightly longer than would be expected from a U.S. White group and their dark shading responses are almost as well organized. The guarded restraint of the Klamath seemed to be neither the result of marked blocking nor apathy. A more detailed discussion of this hypothesis will be appropriate, however, after the case studies have been presented.

K
M

175 1850. Aggressions by Northern Paiute bands led to similar large-
178 scale forays into the country east of Silver and Summer lakes.
726 The almost endemic condition of warfare and the enlarging
K M scale of operations, together with the lucrative trade in booty,
175 brought about the emergence of a chiefly class, the members of
726 which based their power upon eminence in war and possession
• 182 of wealth, including slaves.[10] Their successes attracted followers,
622 and common interest as well as kinship prompted them at times
565 556 to cement alliances with shamans.

756 Thus they drew into their hands coercive powers of no mean
[754] weight, for, as Henry Blow observed, "this [shamanistic] power
was used by the chiefs to get rid of rivals and there are some of
us old enough to remember of doctors being paid to kill certain
persons and of their foretellings of the exact day they would
die."[11]

K M The rise of the chiefs helped to knit together tribal loyalties.
175 A war party formerly consisted of only those among the able-
178 bodied men who were inclined to fighting, but a successful leader
622 increasingly transcended tribelet parochialism, drawing followers
619 from diverse hamlets and villages across the Klamath country.
628 As warfare became a way of life, the occasional allegiance ren-
726 dered while in the field became an enduring acknowledgment
of worth.

K In the growing eminence of the new leadership, hereditary
622 principles may have been operative. Chiloquin mentions his
175 father as having been a chief on Klamath Marsh, his own brother
as a subchief, and a sister as a chief. The father of Dave Hill,
a rising young war leader, was a village chief; while Allen David,
later head chief in reservation days, was the brother of Captain
George, a Klamath Lake chief. That family eminence was not
essential, however, is shown by the personal history of Lileks,
K [838] of good—but not chiefly—background. Lileks was a transvestite
in his youth until a supernatural experience vested him with the
power that was to lead him to be head chief of the Klamath.[12]

K A minor factor in these developments may have been the
195 interest of the whites in the centralization of tribal power, in
643 order that they might deal more effectively with responsible
648 leaders. In 1844, Elijah White, then Sub-agent for Indian affairs
177 met with some Klamath and Molala who had ridden into the

In turn, by appropriate vote
*648 within ninety days, the General Council might—and on occasion
*657 did—reverse the action of its Executive Committee. Finally, by a
642 petition of at least one-fourth of the eligible voters, an action of
646 the General Council might be submitted to a referendum of tribal
[666] members.[3]

In the succession of tribal bodies, the interest of the government was not solely the convenience of securing formal sanction in property matters concerning the common interest of enrolled
[182] members. The tribal government was to provide as well a regular channel by which the government might assess tribal opinion, consult with leaders, and announce programs; and it was to furnish tribal members with experience in responsible citizenship. Through this instrument, a representative body was to be articulated with Bureau administration, its decisions being rendered concrete in official minutes and subjected to review by higher administrative echelons.

Tribal rule is municipal in character, as seen in the restricted scope of its powers.[4] The narrow administrative domain with which the Klamath executive dealt is suggested by the names of the permanent adjuncts of the Executive Committee, the Tribal Loan Board and the Enrollment Committee. In 1947, some fifteen tribal members and one other were employed in General Council and Loan Board activities. By contrast, the Superintendent employed 123 persons, including 31 tribal members and 40 Indians from other groups, in the administration of agency, health, extension, law and order, roads, forestry and grazing, and irrigation.[5] Over these areas the Executive Committee might exercise a veto by cutting from the proposed Agency budget tribal funds allocated to an unwanted item. In this way, the hospital, bull pool, and tribal herd have occasionally been threatened. Ordinarily, however, the Executive Committee took no positive action in the development of a budget. Understandably, Klamath efforts to appoint a tribal member to serve as watchdog over Agency administration were not kindly received.

[693] In the formulation of general policy, the executive drew upon the advice of the tribal attorney, as well as upon unofficial counsel, both sought and volunteered. All major policy decisions required approval by the General Council and were subject to review within the Bureau of Indian Affairs and the Department

*648 surveillance; they have then had to make their peace in another
*657 community. In other instances, measures—for example, early
177 sawmills, drought cattle, loan funds—designed by the administration to be instrumental in helping the Indians to attain distant goals of betterment, were diverted by tribal recipients to provide short-range benefits. Such action, present even in early times, became more pronounced as disillusionment set in; and organized forms of opposition were also added. In a formal character, there
[619] was an insistence upon the prerogatives that marked tribal identity. Hence the highly emotional attachment to treaty rights, in however altered form hunting and fishing may be exploited; to the tribal government, however criticized its incumbents; and to the self-preserving myth of the past.

*648 There is, however, another side to the Klamath reaction which
*657 is to be seen in the anomic aspects of the life of Intermediate and
177 Inframodal segments of those dwelling in Chiloquin—although
• 182 this behavior was not limited to that city. Within Chiloquin,
184 those persons manifest many of the traits that Leighton terms
156 disintegrative: a high frequency of broken homes, of hostility, crime, and delinquency; weak development of associations, recreation, communication, and leadership.[8] For the community as a whole, their effect is accurately characterized by his term. At the same time, their behavior had acquired such substantial predictability that the city fathers had come to rely upon it in the form of revenues from the municipal tavern and fines and trusty labor, for a considerable portion of the municipal budget. Under these circumstances, one might fairly say that a stabilized cultural pluralism existed.

*648 A situation like this cannot fail to leave psychological marks,
*657 and indeed Clifton,[9] observing that "there is very little evidence
177 to suggest, unequivocally, that guarded restraint was a dominant
156 component of aboriginal character structure," considers that attribute to be largely a reaction to the complex unpredictabilities of the reservation. Indeed, the Klamath reaction has striking
[171] parallels in the "hostile dependence" of the Sioux[10] and the "valuation group alienation" of the Aleut;[11] and it bears close resemblance to the situation described for the Ojibway by James,[12] who sees the personality traits he analyzes to have their source in the immediate context of white-Ojibway relations.

NATIVE MYTH AND MODERN RELIGION AMONG THE KLAMATH INDIANS

By Robert F. Spencer

773 IN A RECENT STUDY[1] of social change among the Klamath Indians 177 of southern Oregon, informants revealed an unformalized synthesis of 178 aboriginal and modern Christian religious beliefs. These involve, among 179 other ideas, an identification of the Klamath culture hero with personages in the Christian pantheon such as the God-Father, Jesus, and Satan. This is of interest since the contemporary Klamath have lost all formalized aspects of their older culture. The major institutions of the past have fallen by the way and, in their overt forms at least, have been replaced by those of the encroaching Anglo-American society. Acculturation is so far along that the observer 182 can elicit only covert survivals of aboriginal ideas. Although the tone of the folk culture has been lost by the Klamath, the reservation life, a common economy, and the wardship status enforced by external governmental agencies combine to effect a haphazard solidarity in the group. It is hence not surprising to discover a rephrasing of older values to meet modern situations. A case in point is the attempt by many tribal members, young and old, to find continuity in folklore and so to read Christian meaning into aboriginal myth.

175 Klamath culture of the past was not essentially different in its orientation 177 from that of many western tribes. Because the tribe was geographically marginal to several culture areas, it is possible to note the composite nature of its culture and to discern the realignment and reintegration of elements which 222 it shared with California, the Plateau-Basin, and the Northwest Coast. In 226 its overall configuration, the native culture differed from that of the adjacent gathering peoples because the Klamath had settled on the lakes and marshes 631 of the region and depended on fish and a wild water-lily. Beyond the basic 621 economic structure, however, one may note the California flavor of the separa-771 tistic hamlets with their loose social and political organization; the weakly 791 developed (and possibly late) wealth complex, suggestive of the Northwest and the Oregon coast; and the formalized shamanistic religion which points to affinities with tribes in the Plateau, California, and elsewhere.[2]

---

101 122 [1] This paper is based on data collected during two summer field sessions, 1948 and 1949, on the Klamath Reservation. Field research was subsidized by grants no. 21 (Reserve Fund, 1947) and no. 1132 (1949) from the American Philosophical Society, Philadelphia, and by research funds from the Department of Anthropology, University of Minnesota, Minneapolis.

113 [2] Cf. Leslie Spier, *Klamath Ethnography* (University of California Publications in American Archaeology and Ethnology, 30, Berkeley, 1930), 224-325; Verne F. Ray, *Cultural Relations in the Plateau of Northwestern America* (F. W. Hodge Anniversary Volume, III, Los Angeles,

773 776 [823] Crow's laughter turned the human and animal objects of his wrath into stones,[6] the basalt outcropping which are today pointed out around the Klamath Reservation as evidence for the truth of the old tale. To summarize, while the culture hero was not himself a source of power for men, the forces at his command were essentially the same as those which every Klamath sought in a formalized quest. Although concerned with natural phenomena like winds, heat, and rain, Kemu'kemps was on the whole indifferent to the fate of men. Like other anthropomorphic or zoömorphic culture heroes, he became the theme of many tales, a source of amusement and entertainment in the aboriginal Klamath culture. But even though humor was present in the tales concerning him, he appears to have been regarded as real and with a slight tinge of awe. There is no question of his marked importance in the aboriginal culture.

177 175 [721] To evaluate properly the Klamath culture hero in the modified setting of the contemporary society, attention must be paid to the religious modifications in the group since the inception of culture change through the encroachment of Anglo-American settlers. The Klamath were never drawn into hostilities with the Whites, unlike their linguistic relatives, the Modoc. Contacted sporadically by Europeans from 1825 on, the Klamath were ultimately drawn into a treaty with the United States in 1864. This reflected pioneer movements to the west and the growth of White population in Oregon. [791] [797] An enforced culture change began with the treaty.[7] There was as a result proscription of the shaman's ecstatic curing activities and an intensity of Christian missionization. Other introductions included a new technology, White education in reservation boarding schools, a new status in relation to an established administrative agency, and new concepts of property, society, and political tribe.[8] The result was in some instances chaotic rebellion, a resistance which took the form not so much of open revolt but rather of a half-hearted and often uncomprehending shift to new cultural values and [182] patterns. The effects are observable today in the tacit rejection of governmental administration and external Euro-American social goals, and in the disorganization of society and personality on the reservation.

175 668 Klamath history is well known since the treaty of 1864. Like many western American tribes, the Klamath were ripe for the native messianic movements, the cults which promised a return to the past and implied expulsion of the European oppressor. An example is the Ghost Dance of 1870.[9] Here Christian

---

[825] [6] Gatschet, pt. 1, 131-132. Some informants suggest that the name for Crow or Raven, Ka'äkemps, is the same as Kemu'kemps. This is doubtful, of course. Parenthetically, many modern Klamath insist that there are no snakes in the Williamson River valley because all were turned to stone by Crow's laughter.

795
771 reservation residents are not attracted. Like its more dramatic predecessors,
178 the Shaker religion fails as a bulwark against societal disorganization.

182 The modern Klamath are in the main nominally Christian. Many are
allied with local churches: Protestant groups attract a fair following; some
771 are Roman Catholics; others now and again join the itinerant Pentecostal
795 and Holiness groups. While many Klamath are unquestionably religious in
184 the accepted Christian sense, the church offers a primary social outlet to
797 those who value group association. Whatever the function of the church on
the reservation today, apparently it has no aboriginal vestiges in its ritual
571 or organization. It would be impossible to say to what extent tribal members
find a link with the native past in the spiritual curing practices of such bodies
as the Pentecostal Assemblies of God, which, however, clearly make no concessions
to aboriginal concepts.

771 It thus seems evident that the overt forms of tribal religion are gone. The
Klamath majority is now avowedly Christian even though church affiliation
177 is not universal. Religious attitudes seem highly diverse. Some individuals,
184 while indifferent to religious tenet, are admittedly attracted by the display
or by social opportunities. Some are devout, others ignore the churches entirely.
Still others, whether or not church members, speculate on religious
questions, show considerable introspective preoccupation, or are frankly
curious about native religion and Christianity. Their opinions and attitudes
755 demonstrate that the aboriginal past is not wholly dead. In this consideration,
757 shamanistic curing may be ruled out, since modern medicine is generally
accepted by the Klamath and, in any case, shamanistic patterns have merged
with the decaying Shaker Cult. Since this is so, the less formalized aspects
of the aboriginal religion survive to intrude now and again into modern conceptualization.

183 The survival of cosmological features may still be observed here and there.
773 For example, tales of people and animals turned to stone by Crow's laughter
are half-credulously recounted by young and old. A surviving custom or two,
183 reflecting the older world-view, might also be noted. A boy who kills his first
224 deer is well advised not to eat its meat himself. By giving the game away,
he averts failure in his next hunting expedition. Hunting on the reservation
today is a sport, no economic value being attached to it. (Aboriginally too,
the Klamath were so well adapted to their specialized lake-marsh economy
that hunting played a distinctly minor part.) This custom, which may stem
from the emphasis on wealth and generosity, is laughed down today but it is
825 still practised. Another very common belief is that animals can speak Klamath
191 but not English. A howling coyote is recognized by young and old as a harbinger
763 of death; the owl says, "'Maklaks, 'maklaks," which "when you hear
it, it means somebody close to you is going to die." The Klamath word means
183 human and refers to the tribe itself. Taboos on the first game of the hunter,
the first wild foods gathered, as well as fear of the owl are widely distributed
among western tribes.

178 But more pertinent here are the modern Klamath views based on the past
which either influence actual behavior or bridge a gap, conceptually, specu-

101 occupy, the names of which they bear; this, despite the lack of
619 any sharp geographic division, rivers or ranges, such as we should
expect to figure in political separatism. There are only three or four miles of open, unoccupied country between the middle Williamson river group and that at the river mouth, for instance, or between the latter and the northernmost outposts of the Klamath falls people about Modoc point. The cases of doubtful divisions really stress this point. Kowa'edi on the lake shore may belong with the middle Williamson division; though only three miles away over a low range of hills, it is somewhat isolated. Similarly the Sprague river settlements toward Yainax, usually included in the same group, are in quite a different district.

721 The third feature pointing to their separatism is the frequent feuds
619 between them. It is quite clear that these involve the tribelets; they
never occur between the settlements of a single division. The point
[171] will be clearer if we contrast Yurok sentiments. There feuds are
between the towns or with only a group of kinsmen within a town,
and at most when several towns are involved in a joint cause, it
appears rather that kinsmen and their friends have been drawn in.[24]
[567] Further, feuds are carried on much as warfare with foreigners;
property is destroyed, women and children enslaved. Such slaves can be retained indefinitely or sold again. We may wonder however if they are not restored when a settlement is bought, or at most retained only to even the score in lives.

The identity of these groups resolves itself solely into such aspects of group consciousness. There is no political mechanism within the group. When it comes to war with outsiders, each group can act for
itself, others may join if they wish. At the other extreme, the towns
[621] are not sharply separated. A town is probably in large part a body
of relatives, although not so clearly so that towns are exogamous. In short, the tribelet is a body with a community of interest which hardly extends to the Klamath as a whole.

115 Only one informant, Pat Kane, suggested dialectic and cultural
197 differentiation. The dialect groupings he gave are purely geographic.
He also assigned shamanistic tricks, medical practices, and games to
• 184 the several divisions, which all other informants emphatically denied.
I could observe no linguistic differences and Gatschet recorded none.

000 The subdivisions or tribelets are:

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

This is also a man's game played by about six in a row on each side. Two men are each provided with two short bones, one of each pair marked with a black band. These two change the bones from hand to hand as they sway from side to side crossing and uncrossing their arms, their companions accompanying them with swaying and song the while. The opponents guess the hands which hold the unmarked bones. Twelve sticks for counters are stuck upright between the contenders. As with the four-stick game the successful guess wins the right to hide the bones; at each failure the hiding party takes counters from the neutral pile and, when this is exhausted, from the opponent's winnings. Here too the guess is indicated by a particular and characteristic gesture. In the diagram below the bones are represented as in the hands of two men seated side by side; the crosses indicate the marked, circles the plain bones. 524

Name	*Arrangement*	*Movement*	*Counters taken by hiders*
yo'sKls	xoox	Hand edgewise down middle	2
skĕ'tclös	oxxo	Prone hand forward	2
woi'is[118]	xoxo (or oxox)	Forefinger to right (or left for the second arrangement).	1

When each side has six stick counters, it is called ŏtano'ga, now cooked. The side getting all twelve wins.

Dorsey describes the bones as three inches in length, two wound about the middle with buckskin. The wound pair are called skútash, tied around, or hi'cwöks, men, the others solsas, female (?). The counters he renders kshesh.[119]

My informant reported that the Pit river people have short bones which they roll in grass between their hands, and toss into the air. [184] •

The beaver-tooth dice game (sko'sĕ) has its usual simple form. It is played perhaps more frequently in winter than in summer, and while primarily a woman's game, both men and women play together. The dice are the four crescentic incisor teeth of a beaver, ground hog, or ground squirrel, or bits of wood.[120] The upper teeth (called hlc-

---

[118] These names, which are identical with those for the four-stick game, were given by the same informant but on a different occasion. The names given here are probably correct for both games, hence Dorsey, Gatschet, and my own doubtful alternative for D above, are evidently all wrong. Arrangement A cannot occur in the hand game, of course, since each man must have an assorted pair. [114]

[119] Dorsey, *op. cit.*, 22. In 1930 I collected two sets in which one pair was encircled by a carved and painted fillet. [126]

[120] The Northern Paiute use long sticks for this game, according to this informant. [171]*

114

342 lodges is curious. "It [a Klamath marsh village] was composed of 20 tents built on the water approachable only by canoes, the tents built of large logs shaped like block houses the foundation stone or gravel made solid by piles sunk 6 ft. deep. . . . . Reached Indian village of five huts, but large size square made of earth flat on top the door at the top a defense against arrows but not balls."[368] Frémont notes "they were large round huts, perhaps 20 feet in diameter, with rounded tops, on which was the door by which they descended into the interior. Within, they were supported by posts and beams." At another place "the huts . . . . were made of tall rushes and willows."[369] [361]

342 There is considerable variation in the size of houses, even those of one type. Earth-lodges range in diameter from twelve to thirty feet or more, the larger accommodating several families. The largest pit I saw measured thirty-five feet in diameter. The largest earth-lodges are invariably those of shamans, larger even that those of chiefs. This is not only the statement of my several informants, but on every site I visited the largest pits were pointed out to me as the former residences of shamans. The shaman's lodge, to be sure, houses the winter performances, but this also implies that shamans are the wealthiest individuals, or were so at least before the ascendancy of the chiefs during the last century. Winter houses are commonly larger than the corresponding summer mat-covered forms. • 184 [756] [622]

342 The semi-subterranean earth-lodge is erected over a shallow pit (sloko'ps). This is commonly but knee deep, but the thirty-five-foot pit mentioned above had been excavated waist deep or even more. All the clearly defined house pits that I saw were circular, but I got the impression from one informant that the house might be somewhat squared. This is probably the case only with the summer mat-lodge: wu'kē'plōk̦s. The circle is not measured in any way. The pit is dug with digging sticks, the earth thrown back all around the excavation with storage baskets (tlūk̦s) or slabs of pine bark.

The roof has the form of a truncated, wedge-shaped cone, resting as it does on the circular periphery of the pit but with its upper truncated surface an elongated rectangle. The main frame is formed by four central posts, set to form the corners of this rectangle.[370] The tops of these are connected by stringers. Poles extending obliquely

[369] Frémont, Narrative, 122; Memoirs, 494.

[417] [370] Barrett implies a single center post ("climbs down . . . . by means of steps cut into the center pole itself," p. 244), but this was denied by my informants.

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

291 [756] [531] [177] The familiar triangular flaps below the neck in Plains shirts are lacking. Shamans alone paint their shirts, others who attempt it would be poisoned by them. The designs are spots, circles, and lines, not pictures. While I do not know the character of these designs, this suggests the protective shirts of the Ghost dance of 1890. Inasmuch as we must assume that the shirt reached the Klamath from the east, and it is possible that Plains influences are quite recent, it is possible that the shirt, or at least its decoration, came only in Ghost dance days. Nor are shirts worn at all times; they are too valuable, "they might wear out"; which represents their unusualness in the view of the Klamath.

Breechclouts (haewi'skis) are made of buckskin, and nothing else. They are worn by women too, but not with the buckskin dress. It seems that the flaps which hang over the belt are short, for they are said to be long only if the skin happened to be long. The belt is only a thin string, presumably a leather thong, for poor people make it of the soft bark of the tule.

[184] Men's leggings are thigh-length or calf-length (called respectively snäsni'ks and midë's);[380] women wear only the latter. These are of buckskin or fur, but poor people make them of tules. Barrett illustrates one of the latter sort made in twined technique. The full-length leggings are tied to the belt at one point, the hips. In a photograph shown me, little deer dew claws were hung pendant from the front of the leggings just below the knees.

Moccasins are worn at all times by the men, at home or when traveling, whereas women sometimes go barefoot at home in the summer. For the most part, moccasins are woven of tule or swamp grass; very few are made of skin. Barrett observes that the buckskin moccasins are for summer wear, the winter ones of tule.[381] This is very probably the case, as the tule affair is intended primarily to hold a layer of dry grass next the foot.

[171] [531] Tule moccasins (wipgä') are made in open twine. The fabric is brought together over the toe, but is quite without a heel. A cord laced through the loops along each side draws it up around the foot. They resemble those of the Paviotso.[382] For traveling they make moccasins of this type of swamp grass, which is stronger than tule; those for home use are of tule and bear decorations.

---

[380] Gatschet gives mitash, mitas, from Chinook jargon mindash, derived from French mitasse (2:221).

[381] Material Culture, 255, pl. 17, 19.

[382] Lowie, Notes on Shoshonean Ethnography, 218, fig. 5b, c.

OOO used occasionally in summer also, on mountain near spring.

59. NF: Slender straight pieces of willow stuck in ground in circle; 3-4 openings left in circle; willow roof over top. Acorn meal scattered on ground inside trap; birds unable to find way out; removed by person watching trap.

62. NS: Used in winter.

65. Long slender acorns from live oaks used.

68. At: For bear; acorn bait.

69. AW, WT, WM, MM, MF, NF, NS: Single stone deadfall used for catching mice. MM, MF, NF, NS: Used for catching rats; WM, WS: not used for rats. MM, MF: Used for ground squirrels; WM, WS, NF, NS: not used for ground squirrels.

[224] 71. Kl: Pitfall (benč) used for deer; Spier says Kl did not use (Klamath, p. 158); 2 informants questioned, both denied pitfall a recent innovation. SW: Hole wider at bottom than at top; used for small animals only. AW: Dig pits with digging stick; if find ground to be too hard, leave pit unfinished.

76. AE: For coyotes.

Booths and blinds.--

80. SW: Hunters hide behind bushes in open country, where antelope found.

87a. WM: See note 40.

89. Mo: Tules matted over prow and sides of boat; hunter inside.

[224] [417] 92. Kl: Pumice stone enclosures (wa'akkIs) 6 ft. in diameter, no roof; built by single hunter.

94. SW: No pit, but bonfires built at deer licks, and deer shot as they come to fire. Also hunter conceals self at deer licks, on moonlight nights, to shoot deer.

Disguises, decoys.--

[224] [184] 95. Deer head generally, but among some groups antelope heads also. Kl: Spier (Klamath, p. 158) says Kl did not use disguise, but my informant described it, said used by Kl of Klamath Marsh. NF: Hunter wears yellowhammer-band headdress to attract deer's attention.

96. AW: Prong horn head used only; none of neck skin left attached.

98. SE: Mink hides fastened over deerskin in summer, when deer shedding, to make disguise look more natural (Jake Smith, informant).

101. AW: Tules used for disguise; for ducks only, when driving them toward net (see note 10, also element 42).

[223] [373] 106. Kl: Jack light. Put fire at 1 end of canoe; tule mats around fire. As canoe floats down-river ducks fly down to light; shot with bow and arrow. Sometimes ducks so thick they put out the fire. Done at night, in freezing weather. At: Fire set on 1 end of canoe, for ducks; flares not used but attributed by informant to Madesi Achomawi. AW: Small fire carried in 1 end of canoe, at night, over which boatmen warm hands only. "People at Big Bend (Madesi

[170-A]

Dress

Headgear, robes.--

291 [184] 1713. Kl: Brim on men's caps, painting of men's caps, denied for Klamath Marsh groups (see Spier, Klamath, pp. 182-183). WT: "Worn at Willow Creek [Hupa] and on McCloud River [WM], but not among WT." WM: Upriver people [WS] give WM women basket caps occasionally.

1715. See Spier, Klamath, fig. 13,c, p. 180. Specimen of Kl woman's basket cap shown to all informants to verify this element.

1718. AW: If man wears basket cap, he is ridiculed. AE: Never worn by men.

1723. Worn in winter. SE: Feathers attached to it. AW: Brimless. 000

1726. SW: Worn habitually by men to keep hair down, as women wear basket cap. Not used for packing, as men pack on shoulders.

1729. WM: In war, or war dance; covered with duck skins.

1730. SW: Used by shamans, but not by ordinary persons, except for dances (see element 1943). MV: Tule band to keep hair back.

1734. SW: "Goes with Big Head dance."

[226] [292] 1735. Kl: Tule mat (ste'holas) 3 ft. wide, 4-5 ft. long, used when fishing in daytime on ice; fisherman covers head with mat "to make it dark underneath so that he can see into the water plainly." At: Tule eyeshade woven, "like blinders"; projected from each side of wearer's head; tied on by band around head. Informant's husband used such when fishing for trout in boat at night so light would not get into his eyes.

1736. Mo: Charcoal mixed with pitch.

1737. MV: Used commonly in cold weather, especially by women when outside pounding food.

1741. At: Used in rainy weather by few people only.

[291] 1743. Kl, WS, MM: Worn thus by men and women. Mo, At, AW, MF, NM: By men only. SE, WT, WM: By women only. (See note 1744.)

1744. SE, WT, WM, NM: Worn thus by men. At, AW, AE, MF: By women.

1747. AW: N of "real" Achomawi, group at Dany (Suk'mawi) use bearskin caps. But "real Achomawi were river Indians; they stayed around the rivers, fished; every man had a canoe, and belonged to the river. They went out [hunting] for a little while, then returned to the river."

1749. Mo: Puma "costly" robe.

1750. SE: Beaver hides. WS: Worn by men and women.

Shirts and gowns.--

1751. SW: For everyday wear women's dress consists of 2 whole buckskins, seamed up both sides, tied over both shoulders.

291 439 177 1752. Kl: Bought women's buckskin dresses from Molala, NW of the Kl, and the Warm Springs Indians. "The Molala made them, the Kl bought them, and learned how to make them. That was quite a long time ago, about 90 years; long before the

[198-B]

000 [see note 282] with using shredded willow-bark skirts, "woven at top like a mat, with fringe all the way down. They were too poor to afford buckskin skirts for their women." WT: Woven, "like a gunny sack." MV: Woven willow-bark skirt; extends nearly to ankle; hangs from grass belt. Bark from 2 varieties of willow shredded, left to soak over winter in mud; in spring washed well in clear water for 2-3 days. Underneath this bark skirt woman wears long single front apron of grass, pictured in Dixon, Maidu, fig. 35, p. 163. When woman sits, this grass underapron is tucked between legs.

1802. AE: Sewed tule skirts used formerly; informant dubious concerning style of skirt.

1803. WT: Worn by women. WS: Worn by men.

1807. Mo: Worn by poor people.

1808. At: Women for everyday wear use (1) small shredded tule front apron, deer-hide back apron; (2) 2 buckskin aprons, front one larger than back one. AE: Worn by men. At, WM, WS, MM: Worn by women. NF: Worn by men, women. WM: Front apron of maple bark, back apron of buckskin. When woman sits, she draws front apron in between legs and sits on it.

1813. AE: Man going to war wears small front kilt of shredded sagebrush or greasewood bark, also back kilt of same, but even smaller than front one.

1816. For illustrations of this type skirt see Du Bois, Wintu, pl. 3, p. 147; Goddard, Hupa, pl. 8, fig. 2; Dixon, Shasta, fig. 92, p. 410. Mo: Import braided-grass apron-skirts (snakčas), pine-nut string skirts (nokčas) from Achomawi.

1820. Mo: Wealthy women only, wear.

1822. SW: Seamed up sides, tied at hips; ankle length.

Muffs, mittens; footgear, leggings.--

291
184

1823. Kl: Spier, Klamath, p. 210, states Kl used mittens or mufflike arm garment; my informant said not used by Klamath Marsh group. AW: Muffler of mink, weasel skin also used, for cold weather.

1828. AE: Cased wood-rat skins; used by men in winter when hunting. MF: Buckskin gauntlets with fingers. Term for these, wolosi k'ɛlko, translated as "put one's hand in it"; probably post-White, but informant stated that "when White men came the Indians threw these gloves away."

1830. SE: 2 types: (1) ankle length; (2) boot length. Unless specified in notes or otherwise, entries for elements 1830-1846 refer to both types. At: Pounded grass, or occasionally tule slippers, worn inside moccasins in winter. WM: Not worn in Stillwater area to S.

1831. Mo: Made from tanned buckskin.

1832. Mo: Made from rawhide, with hair left on.

1834. AW: Rich man's moccasins made from neck hide of buck. Poor persons use doe hide.

1836. Not counting added sole. SE: 2 pieces

000 them. "They tell their arrows to be good and to try and hold up, not to be weak; just as though talking to person. Do this for hour or so, only."

2824. AE, WT, WS: 2-3 days.

2826. WM: 2-3 nights.

2836. At: In war against Wintu (see note 2770) made effigy of Wintu woman, with willow withes and sunflower leaves, and shot at it. Also man "grabbed wife, pulled her around, boasted that was what he was going to do with Wintun women." In excitement of dance, 1 man also shot his own dog.

2841. NS: If use paint when visiting Miwok, for example, it is used to denote that visit is peaceful and visitors do not want any quarrels; usually use red paint, applied in stripes to face. Also use same for dances; informant did not know whether such used for war.

2844. Chalk used most frequently. Large deposits in At, AW area. SW: White paint preeminently war paint.

2852. NF: Yellowhammer-quill headband, or beaver-fur fillet worn; also feather belts with long "tail" pendant in rear; this attire so fascinated enemy, that latter "forgot to shoot."

2853. WT, WM, WS: Used as dagger, sometimes (cf. Du Bois, Wintu, p. 125).

Procedure

Declaration and manner of fighting; captives; booty and scalps.--

726 2855. Kl: In feud arising from seduction of married women, 10-20 men may line up on 2 sides, ready to fight, unless settlement is made by payment.

2856. Kl: War party encircles village; when 2 ends of encircling line come near each other, use owl calls as signal they are near by, and as signal to attack by rushing in upon village.

2858. NF: Young men go first, in attack upon village; older men bring up the rear.

[184] 2859. Kl: See note 2856. My information for Kl runs contra to Spier's (Klamath, p. 29). AE: Use crow calls, not owl calls. All other entries refer to owl calls.

2860. Kl: Use clubs in attack, to hit sleeping victim; if latter jumps up, knock him down. After first attack, use bow and arrows; continue fighting for most of day in village; at night return home.

000 2865. SW: Only in intertribal wars; no prisoners taken in intratribal feuds.

[727] 2866. SE, WM: Captive's arm tied to that of capturer's, on return journey of war party; this denied for Kl, WS; Mo uncertain. No rope ("captive leader") used by Kl, Mo, SE, WT, WM, WS. WS: Young women and married women whose husbands had been killed during fighting.

2869. WT: Keep woman or child captive for about month; then hold dance, and shoot her with

[211-A]

strung on it. He never kills bird or animal of same species as his guardian spirit(s), but someone else kills these for him, gives feathers, skins to him. SE: See note 4946. SW: Novice acquires pole, with 10 different objects (feathers, skins) on it; this sacred, kept outside house when not being used during shamanistic performance; at latter, shaman brings pole, plants it in ground outside patient's house. See note 4992. At: After man begins to doctor patients he acquires eagle down, woodpecker feathers, yellowhammer band. Ties these feathers inside his whistle. Also acquires bunch supernatural feathers (kaku) which he keeps tied up on willow branch, near creek; when shaman dies, blood drips from these kaku feathers. When shaman first discovers these feathers they are singing; he walks up to them and picks them up. WM: Shamans pass on their feathers, when old and near death, to another shaman; "keep passing them on from 1 to another. Sometimes the feathers tell doctor to put them in the water ['bury' them]; or feathers may say, 'No, I want to be alive, give me to another doctor.'" If, on receiving the feathers a shaman does not know how to handle them, he tells them he cannot keep them and is going to put them in the water.

4871. At: See preceding At note. Shaman never brings these feathers inside house, or uses them in curing performance; there may be children playing around who might make too much noise; feathers might become disturbed, poison people.

4872. At: See note 4870 At.

4873. At: Also, if man dreams "good" (acquires luck) after birth of child, "he never tells about his dream; if he does, he won't have any luck."

Sucking doctors: doctor-making rites.--

4874. SE, SW: 2 dances entered for each of these groups: (1) dance which novice performs alone in sweat house immediately after obtaining vision; (2) public winter dance in sweat house, following which a novice shaman may start curing. If SE, SW entries for elements 4875-4924 relate to one type dance only, note explains to which; if entries relate to both types dance, no note.

[756
[178
[184

4874a. Kl: Spier, Klamath, p. 113, says rites last 5 nights and days; my informant, who had danced at these performances, said 1, but probably he was referring to more recent curtailed performances. WT: 1-4.

4875. SE: Novice dances 3 nights, alone; public winter dance lasts 2 nights. WM: 4-5 nights.

4877. NF: Doctor dance (yomuse) starts in morning; at noon eat dinner; in afternoon dance again, then eat supper; then dance all night around fire. By daylight dance is over. Men, women shamans dance; women hold fox hides, wildcat hides on sticks, while dancing; men dance inside circle of women dancers, and wear yellowhammer bands on their heads. Novice doctors join in dance. During daytime dancing, shamans, in turn, hold cocoon rattle on stick, gaze straight

K 361 342 343

for the seclusion of menstruant or parturient women, contact with whom is particularly injurious to shamans.

K M 342

The earth lodges, frequently dismantled in the spring after becoming waterlogged by the melting snows, are rebuilt in the fall. They are semisubterranean, built within a circular pit one to four feet in depth—the Modoc excavations tend to be somewhat deeper than the Klamath—and range in diameter from twelve feet for a single family to over thirty-five feet for the residence of a shaman. Four central posts support horizontal plates, with a split-log beam slanting down from each corner into the ground beyond the edge of the pit. Horizontal stringers between the beams in turn bear a layer of rafters, laid side by side around the house. Cracks are chinked with sticks and bark; and the surface is covered successively with rough matting, with grass laid along the lower edge, and finally with dirt. On top, rough planks are laid between the plates, leaving a hatchway that serves simultaneously as smoke hole and entrance.

K m [184] •

A similar structure, erected over a shallow depression or none at all, lacking the earth covering, and with side entrance, might also be used during the winter, but is most frequently the residence of warmer weather. The house is constructed by its future residents: working together, says Ray, Modoc may take a month to build an earth lodge.

K m 342 352 353 [417] [354]

Both Klamath and Modoc conceive of the house as facing east, and on that side a stairway ascends. Within, a ladder thrusts through the hatchway, and down this the visitor climbs, being careful, if a woman, to manage her fringed skirt to observe the proper modesty. Once below and standing beside the central fireplace, he makes out the dim details. Behind him, at the front of the house, firewood is stacked in tiers, while across the back a partition has been made behind which are stored foodstuffs and gear. Many houses dispense with a partition, and supplies are kept on the ledge between pit and wall. From the rafters dried fish and roots hang.

K M 342 352 513

The floor is covered with mats, which sometimes extend up the walls. Along the walls the members of the household sit or sleep upon a bedding of mats thrown over grass, with an occasional blanket woven of tule and cattail, sometimes with feathers worked in, or of animal pelt. The left side of the house, as the visitor faces forward, is reserved for the family

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

six spayed heifers, and of course they desire to dispose of them."[74] 648* 657* 231

Stock raising, administrators agreed, was the industry best suited to the reservation and to the Indian. Several persons, among them Henry Jackson, had accumulated large herds, and it was thought that their example and a favorable administrative climate would encourage others to take it up. With the issuance of the treaty stock, the total of Indian-owned cattle had been raised to 11,000. They were, however, unequally distributed, for [184] • while some of the Indians possessed herds described as "good-sized," others had only the four head issued.[75]

A report on 205 school graduates practicing stock raising in 1910 characterizes 28 as successful, 133 as fairly successful, 43 as failures, and 1 as a total failure. Although no criteria are given, allusions to these individuals in correspondence, together with the evaluations of modern informants tend to corroborate their placement in the list. Is should not be surprising that a number of Agency employees appear among the successful, and that several troublemakers were among the failures. Perhaps significantly, two tribal leaders of the time, Jefferson Riddle and Clayton Kirk, were assigned to the latter group. Some men who had previously been successful, in other endeavors were not making a go of stock raising. Thus Stonewall Jackson, who had formerly done well in raising potatoes in the Modoc Point area,[76] was now listed as unsuccessful as a stock raiser.

A fair degree of success did not always, however, imply an 648* equal competence at handling money; for at least one man so 657* listed was at that time being rationed in funds.[77] There is no 434 clear correlation between the number of interbreeds and the degree of success in ranching.[78] It might be added that two years before 58 men had been given permission to manage their own allotments. Of them, the 1910 report lists 15 as successful, 30 as fairly successful, and 5 as failures. Eight do not appear on the 1910 list.[79] The earlier action, falling selectively on those deemed more qualified, shows that administrative action did recognize individual ability.

Nonetheless, with the development, beginning in 1913, of a [313] lumber industry exploiting tribal timber and providing per

648* 657* 16

men. The major attractions, however, were the stores, the schools, the movies, the excitement, and the entertainment. These advantages seem likewise to have favored the shift to larger communities.

Thus, over an extended period of time, there has been a substantial and growing body of Klamath who, while retaining an equity in the tribal estate and membership in the tribal body, have come to dwell away from the reservation and who visit it infrequently, if at all. Their daily life is spent within a milieu, and in reliance upon a "personal community"—to use Jules Henry's expressive term[5]—made up largely of non-Klamath.

648* 657* 144

The heterogeneity of the Klamath is also reflected by their biological composition. While the characterization of the degree of Indian heritage, expressed as a "blood quantum," is open to occasional error in individual instances, the figures taken in summation reveal significant differences. By 1955, only twenty-eight per cent of the absentee members could claim to be biologically of over one-half Indian ancestry, and even for those dwelling upon the reservation the corresponding figure was no more than fifty-four per cent. Within the reservation, in turn, Lower End Klamath were markedly less Indian by this measure, falling between the values for absentee and Upper End members.[6]

648* 657* 162

Like many other Indian groups, the Klamath population possesses a large segment of younger members, marking an increase over the early decades of the present century. In the days of termination, those under twenty years of age comprised no fewer than forty-seven per cent of the total tribal membership, a figure exceeding that for the general population of the United States, of which only one-third fell within the corresponding bracket.[7] Although these figures are often interpreted as reflecting improved health conditions on the reservation, they also reflect an increased rate of marriage with non-Indians. [563]

648* 657* 184 361

The variety of Klamath life during the latter days of their tribal existence may be illustrated by data from the Upper End community of Beatty, the Lower End city of Chiloquin, and from the off-reservation communities of Klamath Falls and Eugene-Springfield in the Willamette Valley.

Beatty and Chiloquin represent special facets of reservation

*648 history. Beatty, in the upper valley of the Sprague, lies between
*657 the town of Sprague River, some fourteen miles below it, and
• 184 Bly, roughly the same distance away over the eastern boundary
361 of the reservation. It drew some of its population from Yainax,
when that subagency was closed, as well as from Paiute Camp
[797] to the east. Beatty's nucleus had been the Methodist mission and
store, to which other establishments presently were added, and
houses began to be built about them. White ranchers have
[563] moved in to work the allotted land they bought or rented, usually
bringing their families with them. Others, white, Indian—using
that term for non-Klamath—and Negro, have married tribal
members.

[871] By 1959, however, when the community was studied,[8] it was
in a sharp decline: for in the 1940's the local school had been
[797] closed in a consolidation with the one at Bly; the Methodist
[313] mission had been reduced to an adjunct of the principal mission
on Williamson River, at the Lower End; and the lumber mill
at Sprague River had ceased operations. The community had
[162] survived, though on a greatly reduced scale, with a population
totaling 136 persons, 105 of them tribal members, prevailingly of
Modoc and Paiute derivation, 5 Indians from other reservations,
25 whites, and 1 Negro.

Chiloquin, located at the confluence of the Sprague and Williamson rivers, was the largest community on the reservation, with a population then almost seven times that of Beatty.[9] A mill and market town which burgeoned when tribal timber was opened by the advent of the railroad, Chiloquin was incorporated as a city in 1926 and soon afterward boasted a population, including adjacent woods camps, of approximately two thousand. In its heyday, when along with Modoc Point, Braymill, and Sprague River it pulsed with activity, Chiloquin was a lusty and sometimes rowdy city, enjoying the wicked sobriquet of "The Little Chicago of the West." Below the surface was a structure which provided an institutional extension of American civic life elsewhere. A bank, a newspaper, telephone company, hotels and rooming houses, schools and churches, a boxing association and occasional Chatauqua, moving picture house, taxi company, Ladies' Community Club, Commerce Club, Masons and V.F.W., lawyers, dentists, and doctors: all these shared space with dance-halls, card rooms, bootleggers, pimps, and prostitutes.

The depression and the subsequent loss of mills through fire 648*
and economic distress stripped Chiloquin temporarily of many 657*
of her specialized services. By the time she had emerged from 184•
the slump a decade after World War II, improved communica- 361
tions had enabled Klamath Falls, twenty times as large and only thirty miles away, to supplant Chiloquin in many functions which had previously been discharged locally. Nonetheless, in the course of recovery some services were regained. With an institutional complexity that far transcended that of Beatty, Chiloquin, an enclave of the state of Oregon within the federal jurisdiction of the reservation, offered tribal residents a foretaste of the life that lay beyond reservation boundaries. In 1958 more than thirty per cent of the entire tribal membership had mailing addresses there.

In examining the households of Beatty and Chiloquin, re- 648*
spectively 31 and 297 in number, it is convenient to distinguish 657*
two categories among those including tribal members. That 621
designated Interethnic is headed by a tribal member married to 184
a partner of another ethnic group, white, Mexican, alien Indian, 563
or other. The second, in which both partners are tribal members, 592
will be designated Tribal. The term Klamath will subsume both. [162]

Klamath households in the rural community of Beatty in 1959 comprised well over eighty per cent of the community, the remaining households being largely white. By contrast, in Chiloquin (1949-50) white households were twice the Beatty percentage; while Klamath households amounted only to little over half the population. The remaining ten per cent was made up of other minorities, Mexican, Negro, and Indian. Within the next decade continuing trends in Chiloquin increased the disparity, as white households gained at the expense of all other components.

The figures for Interethnic marriages harmonize with this picture of white preponderance in the larger community. When the total marital record is considered, including successive mates, it is seen that unions with whites comprise only slightly more than one-fifth of the total for reservation members, almost one-third for the Chiloquin segment, and well over three-quarters for a small sample of off-reservation Klamath.[10] Among the Interethnic households of Beatty, the non-Klamath partner was more frequently Indian than white, while in Chiloquin he was

*648 generally white. When it is considered that in American society
*657 the husband maintains significant external relationships,[11] it
184 seems significant that in both Chiloquin and Beatty in some three-
621 fourths of the Interethnic households the husband was an out-
563
592 sider and the wife a Klamath.

Economic Life

*648 From an economic standpoint, tribal members occupied a
*657 subsidiary position in reservation communities. Their participa-
621 tion in productive activities as a whole was small. In 1958, a
434 sample of the reservation population showed the following eco-
464 nomic profile: presently engaged in business or ranching, eigh-
162 teen per cent; previous record of such experience, eleven per cent; no such experience, forty-eight per cent; no data, twenty-three per cent. The figures for those resident in Chiloquin showed, if anything, a lesser degree of direct participation. Available records on a small absentee sample (but one with a higher proportion of women) do not reveal a higher degree of economic experience. The figures are: presently engaged in business or ranching, seven per cent; previous record of such experience, twenty-one per cent; no such experience, seventy per cent; no data, two per cent.

*648 The record of scanty business experience is in large measure
*657 a consequence of the steady flow of income from tribal timber.
434 In 1950, the $800 per capita payments enabled a Klamath family
454 of four to exceed the median income for all families in the county. Since they could also hunt and fish throughout the year, and many families did, their actual income was considerably higher. There was thus little incentive to work to supplement timber revenues. The Meriam committee, to be sure, had observed years before, in the course of their comprehensive study of Indian administration, that the Klamath per capitas were too small for investment and thus tended to be disbursed for current living expenses;[12] but it is also true that, lacking investment experience, tribal members who realized substantial sum from the sale of allotments too often treated them as windfalls to be squandered, rather than as capital capable of bringing further financial returns.

000 Comparison with the record of white performances places the

as well by envious whites. Indeed, prominent among the local 648*
advantages which white residents stated bound them to Chilo- 657*
quin were the advantages offered by the reservation for hunting 224
and fishing. At the same time, the whites tended to regard those 226
pursuits as no more than recreational avocations; and if the 181
Klamath were sometimes credited with inherent aptitudes for the chase, they were also looked down upon for devoting so much time to "play," and for ignoring, as many did, the white canons of sportsmanship.

Conflicting viewpoints were likewise evinced in the relation- 648*
ships of tribal members seen as consumers. While there were 657*
wide differences in actual behavior both among and between 571
whites and Indians, relationships came often to be governed by
stereotypes. This was particularly so in the larger communities, [621]
in instances in which individuals were not personally known to [184]
each other.

Those relationships were in fact strongly conditioned by the 648*
peculiar status of the tribal members who relied upon per capitas 657*
for their income. Few Klamath on the reservation had ever 434
banked money, and the absence of a bank in Chiloquin since the 571
depression, or in any other reservation town, made necessary 452
the institution of a credit system.[13] Since much Indian property [453]
was held in trust by the government, which thus could not be advanced as security, merchants had to rely heavily upon a knowledge of the individual in advancing credit. Reservation stores resorted to a credit system to compete with the businesses in Klamath Falls, and through a more intimate acquaintance with tribal members could assess the risk more skillfully than those—particularly the newcomers—in the county seat. At the same time, the expense of operating such a system was one of the factors in advancing prices in reservation stores. Thus merchants, who not infrequently did their own private shopping in Klamath Falls, were galled to see tribal customers, whom they had carried on credit, patronizing competitors in the larger city as soon as they had received their per capitas.

In attempting to collect outstanding debts, merchants could 648*
not count upon the Superintendents, but had to resort to moral 657*
suasion and threaten to cut off further credit. Some Superinten- 434
dents did assist in bringing pressure to bear upon delinquent 452

of tribal members held aloof, while some members were no more 648* 657*
than "Sunday" or "holiday" Shakers, attending services only at 795
wide intervals. 177

That there was no single Klamath response to culture contact 648*
even upon the reservation, must now be abundantly clear. It is 657*
also true that tribal members are not to be found extended along 184 •
a single continuum of change. No typology satisfactorily pre- 177
serves the mosaiclike pattern of the accommodation they have 178
made. For the course, even of institutional change, is the product, not of the engagement of reified "cultures," but of the countless individual choices expressed before concrete alternatives and projected against past experience. In the successive role-relationships into which they have entered, the biographies of some elderly Klamath suggest that there may well have been for them an inner continuity, not unchanging, which provided in their life-way a reference and a means of self-identification.[15] For many younger tribal members, however, the range of possible identification has become greater, while coercive restraints have weakened; and their selection among behaviors may be so conditioned by factors in the immediate situation as to appear inconsistent from one time to the next. Cultural confusion may well have resulted in their failure to form a stable self-image.

A central characteristic of modern Klamath relationships has 648*
been termed, for want of a happier phrase, "permissive diver- 657*
sity."[16] By this is meant a condition offering the individual a wide 156
latitude of choice among multiple and optional alternatives, per- 177
mitted modes being not only broad in range but diffusely de- 178
limited. Analyses of Klamath myths[17] and of the ethnological record suggest that this state, which corresponds in large measure to the "loose structuring" of Embree,[18] was characteristic of aboriginal Klamath culture, but it may well have been enhanced in reservation times by the breakdown of native agencies of control and by those other developments fostering individualism. The roots of its continuity lie in conditions of child-rearing, already reviewed, as well as in the social transactions of adult life.

The corresponding qualities in the individual are equally clear. For many Klamath, the interpersonal distance is of considerable magnitude, and constitutes a wary, defensive response to the

*648 formal occasions in the General Council in a demonstration of
*657 decorative oratory; and there it might also serve a speaker to
177 shut out a heckler who knew only English. In such a session, a
178 member in the audience, although fluent in English, might de-
191 mand the services of an interpreter for the purpose of underscoring his Indian status. Similar functions were served when Klamath was spoken in the presence of whites. The ability to shift from one language to another, or from one behavioral modality to another, was akin to the behavior which Polgar has described in the "biculturation" of Fox children.[21]

*648 In the latter days of the reservation, there were few occasions
*657 when tribal members came together for traditional events, and
177 the sessions of the General Council constituted the main remain-
178 ing tribal gathering. Such individuals as our old friend mentioned
623 above had their closest and most continuous relations with chil-
619 dren and grandchildren, who by no means shared their outlook.
571 On the occasional visits of their aged peers, these elders ex*changed memories* and expressed common concerns which were as much the product of the parallel roles they then performed in their respective families as of the time in which they had grown up.

*648 Such accommodation as there has been to American culture has
*657 not only changed through time with alterations in the state of
177 Klamath and American cultures; but at any single time, Klamath
178 have drawn diversely from what was available. Thus, the small
• 184 number of families in Chiloquin that have attained a measure of social acceptance by whites of middle or high status have done so by manifesting the appropriate life style. In so doing, unless they are able deftly to shift role-orientations, being now Klamath, now white, they have had to sacrifice close relations with their kin. "Some of my family I never see any more," remarked one such woman, "and I don't want to see them." They often forbade their children to play with undesirable tribal children. Insistence upon household neatness, fastidious emphasis upon personal cleanliness, punctuality, and adherence to self-standards usually accompanied these attitudes.

Inframodal behavior among Klamath in turn has by no means been random in form, but has approximated already established patterns in the dominant culture; often combining them in ways

that seem bizarre. In evading prohibition, as already noted, tribal 648*
members learned successively to operate stills, to patronize and 657*
to serve as bootleggers, and to drink alcoholic extracts. For local 177
roughs, the pug and the cowboy provided glamorous models; 178
and several youths ventured upon the hard trail of the professional 184•
boxer. Although cowboy hats and boots were still worn in [883]
the latter days of the reservation, they were giving way among this set to the ducktail haircut and the leather jacket. Drag racing and drinking were pursuits as common among tribal adolescents in Chiloquin as among their peers elsewhere. The intermittent use of marijuana cigarettes and an occasional Pachuco tattoo were evidence of the selective adoption of Inframodal practices.

As a category, the inframodal Klamath were often the immediate descendants of some of the elderly individuals already mentioned, dependent upon them for money once they had squandered their own funds, sometimes residing with them, sometimes "shacking up" in a separate household in a common-law union. They formed but one range of the main body of tribal members, among whom they found associates perhaps as often
as they did among their own sort. They did not habitually associate [571]
with Inframodal peers among other racial groups, but [573]
characteristically remained in small tribal cliques, of which the [273]
drinking groups were the chief stable expression.[22]

Those tribal members still on the reservation comprised a main body, upon which three lobes might be distinguished: the elders, the Inframodal, and those conformant to American standards. The latter alone had tended to become almost completely cut off from the major body of their fellow tribesmen, save for a few leaders, who had been able to keep the respect of both whites and Klamath. The remainder constituted a single society of strong egalitarian persuasions.

While recognizing that a single criterion must fail as a device 648*
for sorting out categories which are the product of such complexity, 657*
a first approximation was attempted in an analysis of the 177
records of a random sample of tribal members in Chiloquin.[23] As 178
sorting criteria, the subjects were first scaled against five somewhat 184
overlapping entries involving behavior before the law. Then, 125
working symmetrically from the extremes of the scale, they were

*648 divided into three segments as nearly equal in size as possible.[24]
*657 The symmetrical cuts resulted in a Conformant segment, prevailingly
177 law-abiding in record, almost twice as large as the Inframodal
178 category at the other end, which consisted of these
• 184 persons with the highest record of violations. The Intermediate
125 membership was slightly larger than that of the Conformant.[25]

The characteristics of each of these categories, when contrasted, tend to confirm statements made previously. Members of the Conformant segment were least Indian biologically and included the highest proportion of women. They seem to have come from comparatively smaller families and, with the Intermediate subjects, seem to have received far more adequate parental care than did the Inframodal category. Educational achievements are less distinctive, reflecting the compulsory nature of schooling on the reservation, but again the Inframodal segment lags behind the others in school grade completed. In the measure of engagement in business or ranching and in record of money management, the distinctions are decisive, with the Conformant category far outstripping its fellows and the Inframodal segment at the bottom. Finally, in both the percentage of those married and living with spouse and family as well as in the stability of residence the same order is seen.

In the second part of the study, the thirty Klamath subjects who had given Dr. Clifton responses to the Murray Thematic Apperception Test (TAT)[26] were assigned by judgment to the three segments, the protocols of each category being treated together by a method of analysis previously employed in examining Klamath mythology.[27] When all of the modern TAT segments were combined and contrasted with the myths, the responses were seen to reflect changes which had in fact taken place through time. Thus a trend toward a universalistic outlook
[602] was reflected, along with lessened attention to the ramifications
[594] of kinship, a reduction of the family itself to nuclear form, and
[554] a concurrent diversification of role relationships toward individuals
[571] acting impersonally as employer, policeman, doctor, or
teacher. A secularization of life may also be reflected by the scant consideration of religion in the modern protocols.

[571] When the modern TAT segments were compared, the Conformant subjects were seen to place a strong emphasis upon support

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

given the family by neighbors as well as by the impersonal agents 648*
of society, while making little mention of any kinsmen beyond 657*
the immediate, two-generation family. Members of this category, 177
who objectively were least Indian genetically and who mani- 178
fested the highest measure of intermarriage with whites, were 184•
the only ones to introduce racial comments in their responses. 125
This may well be taken as evidence of their sensitivity to a [571]
marginal condition. In treating intrafamilial roles, they saw a [829]
strong paternal figure (lacking in the protocols of the other two [593]
segments), but they viewed his authority as one against which the son repeatedly rebelled. Moreover, contrary to their own superior record of family stability, members of the Conformant category envisaged the marital bond as frequently threatened by feminine interlopers. Here again is an indication that the Conformant families, like the most acculturated among Vogt's Navaho veterans,[28] had achieved their condition only at the cost of gnawing anxiety.

By contrast, both of the remaining TAT segments tended to [602]
stress kinship, for in their protocols a greater reliance is placed upon grandparents and more remote kinsmen, with correspondingly less dependence upon friends, neighbors, or impersonal agents. Indeed, the Inframodal subjects tended to view the latter with suspicion and outright hostility. In neither segment [593]
was the paternal role seen as prominent; and the mother instead occupied a central position, not disciplining, but strongly supporting her children. Sibling relations, which in the Conformant category had been seen as continuing through life, stood on a lower level among the intermediate subjects, who viewed the bond as existing only in childhood; and were negligible among the Inframodal segment. Similarly, the marital bond appeared to be conceived by Intermediate members as weak, being marked by a succession of casual liaisons, while the Inframodal saw strife between the couple, rather than outside interference, as disrupting the union.

By contrast with Conformant subjects, members of the other
two categories exhibited a far less realistic view of the conditions [829]
making possible achievement, but they did so in different ways. Those of the Intermediate segment seemed to see conformance as a necessary factor for success, although their behavioral record

*648 showed them in fact to be deficient here, and they made complex,
*657 conditional statements about it. They seemed uncertain about
177 the manner in which a prosperous life was to be achieved. The
178 scofflaw members of the Inframodal category, by contrast, saw
• 184 accomplishment as the result of individual strengths, rather than
125 of surrogate support. In this, having regard for their family form,
829 they may be regarded as fairly realistic; but attainment for them
often took fantastic forms. One might say that they were content to play with the idea but were unprepared to put it into practice. In their treatment of crime and violence they took a realistic view, as against the Conformant subjects, who also gave it prominence, or the Intermediate category, who seldom discussed it; and they often saw them from the perspective of the violator. Conformant concern with crime and violence, by contrast, was coupled with the view that punishment, often involving remorse as well, was both merited and certain.

*648 Several general comments may be offered. In the first place, the
*657 Conformant subjects stand somewhat apart from members of
177 the other two categories in adherence to standards dominant
178 among whites. A matter of some note is the size of the group.
184 While the size of segments was determined by the purposes of
the study, the impression is strong that a larger proportion of tribal members would seem to be attuned already to values honored in American society than have been accepted by their white peers. Social acceptance, from this point of view, has lagged behind the formation of acceptable attitudes.

There are reasons for this. On the one hand, a number of tribal members approve these attitudes as merely reflecting those of the traditional Klamath. Some of them, despite Conformant behavior, decline to choose white associates if it means giving up ties with Klamath kin and friends. Then, too, among whites the formation of acceptable attitudes and behavior must be accompanied by other qualifications, discussed earlier. Major white stereotypes, as can be seen, have been formed about behavior and attitudes found principally among the minority of Klamath who fall into the Inframodal segment, and these have been extended to characterize tribal members as a whole.

Finally, behavior of Inframodal type is more complex than may appear at first. It was present, in somewhat different form, in

aboriginal Klamath culture; it has assumed some of the aspects 648*
of criminal behavior among whites; and as already noted is 657*
turned against the institutions of the whites and the persons of 177
Klamath. If Inframodal individuals are seen as rejecting the 178
ambient culture, they spurn only selected parts of it; and they 184
might have rebelled in similar fashion had they lived in the
native society a century and a half earlier.

There is much that continues to link most tribal members together. The assessment of an earlier paper seems valid.

> An individual may act in a manner that both we and the Klamath define as anti-social. Affected kinfolk may object, but their voice is muted and their efforts frequently null. Yet outside of the group immediately affected, the offender may find ready acceptance and even approval, so long as he has not violated the cultural standards of independence, of indifference to pain, danger, or personal inconvenience, of open-handed liberality, of steadfastness to a friend, and of a shrewd opportunism to others. But because there is now no homogeneous mode of behavior governing relations with members of social groups, and no effective coercive agent, Klamath behavior today probably departs more widely from the mode than it did in aboriginal times.* [571]

Thus, in various ways the Klamath have come to be differentially
distributed, even within the confines of one small reservation
town. Members have become acculturated in behavior and
attitude to varying degrees and in divergent directions. Through [563]
intermarriage, they have come to manifest a range of biological
features, some more acceptable than others to non-Klamath.
Finally, they have come to be ranked by whites upon a social
gradient, although as a whole they are assigned an inferior position.
In turn, historical, cultural, ethnic, and social considerations
have led most tribal members to eschew their placement
and to maintain a life somewhat apart. A major factor in their
sense of separateness is the identity accorded corporate image
by the tribal government. The following chapter reviews that
institution.

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

While the political strength of a family is seen not only in the 648*
succession of interest but in a propensity for members of a family 657*
to vote *en bloc*, this is far from invariably true. The schism 619
separating Jesse Kirk from his half-brother, Joseph, is one promi- 602
nent instance—and by no means the only one—to the contrary. [665]
In fact, alignment within the family and extended kin has often [578]
been modified by contending considerations.

Nonetheless, for some leaders the solidarity of family some- 648*
times took precedence over impartiality in the discharge of office. 657*
One tribal council member is quoted as defending his action 661
favoring certain enrollments by the explanation ". . . that since 602
two children were his niece's children, he felt that it was his duty 619
to guard the interests of his minor relatives."[8] Political leaders,
seeking to emphasize the purity of their motives, needed to go no
further in justification than to declare that they sought only the
welfare of their grandchildren.

Although intermarriage and alternative associations have long 648*
overlaid clear identification with the several peoples who had 657*
entered into the treaty, such affiliations have continued to exert 563
political force, however greatly diminished in recent years. In 621
turn, they related to the two broad communities on the reserva- 619
tion. The Lower End remained predominantly Klamath, while
Modoc, Paiute, as well as a number of Klamath and Pit River,
comprised the Upper End community some forty miles away.
Even after the closing of the subagency at Yainax, the populations [184] •
of Sprague River and Beatty continued to reflect the special
character of the eastern reservation.

In turn, the relatively easier access of the Lower End to out- [177]
side influences—a subject already reviewed in discussing modern
tribal demography—superimposed the effects of differential ac-
culturation and intermarriage upon the traditional subtribal
allegiances that distinguished the two Ends. Difficulty of travel 648*
along the road from the Agency to Yainax had given rise to the 657*
practice, long maintained, of holding separate councils at each 621
place. Thus at the two Ends there had developed political com- 665
munities responsive to their own local leaders. Harrison Brown, 619
in 1931, played upon a familiar theme when he recognized in
Wade Crawford, a leader from the Lower End ". . . a young man
who is not a full-blood, who is trying to stir up trouble, and we

*648 surveillance; they have then had to make their peace in another
*657 community. In other instances, measures—for example, early
177 sawmills, drought cattle, loan funds—designed by the administration to be instrumental in helping the Indians to attain distant goals of betterment, were diverted by tribal recipients to provide short-range benefits. Such action, present even in early times, became more pronounced as disillusionment set in; and organized forms of opposition were also added. In a formal character, there
[619] was an insistence upon the prerogatives that marked tribal
identity. Hence the highly emotional attachment to treaty rights, in however altered form hunting and fishing may be exploited; to the tribal government, however criticized its incumbents; and to the self-preserving myth of the past.

*648 There is, however, another side to the Klamath reaction which
*657 is to be seen in the anomic aspects of the life of Intermediate and
177 Inframodal segments of those dwelling in Chiloquin—although
182 this behavior was not limited to that city. Within Chiloquin,
• 184 those persons manifest many of the traits that Leighton terms
156 disintegrative: a high frequency of broken homes, of hostility, crime, and delinquency; weak development of associations, recreation, communication, and leadership.[8] For the community as a whole, their effect is accurately characterized by his term. At the same time, their behavior had acquired such substantial predictability that the city fathers had come to rely upon it in the form of revenues from the municipal tavern and fines and trusty labor, for a considerable portion of the municipal budget. Under these circumstances, one might fairly say that a stabilized cultural pluralism existed.

*648 A situation like this cannot fail to leave psychological marks,
*657 and indeed Clifton,[9] observing that "there is very little evidence
177 to suggest, unequivocally, that guarded restraint was a dominant
156 component of aboriginal character structure," considers that attribute to be largely a reaction to the complex unpredictabilities of the reservation. Indeed, the Klamath reaction has striking
[171] parallels in the "hostile dependence" of the Sioux[10] and the
"valuation group alienation" of the Aleut;[11] and it bears close resemblance to the situation described for the Ojibway by James,[12] who sees the personality traits he analyzes to have their source in the immediate context of white-Ojibway relations.

end of Horse Fly valley and Lockey Flat, passing in the vicinity of Keno Spring, and thence westward through, or in the vicinity of, the village of Dairy. It passed a short distance north of Bale's lake and Olene and appears to have left the whole of Lost River valley in the territory of the Modoc. It passed either along the eastern shore of, or through, Lower Klamath lake. Further than this no definite information was obtained concerning this secondary boundary.

ENVIRONMENT.

M
K
13
[184]

The natural environment of the Lutuami, a high, mountainous and volcanic region, filled with lakes and marshes, influenced their culture in many ways. The two lakes, Upper Klamath and Tule or Rhett lake, formed the centers of population for the two divisions, the Klamath and the Modoc. Along the western shore of these lakes, and of Lower Klamath lake, as well as along the high plateau to the east of Upper Klamath lake, there were considerable forests of conifers which provided material for canoes and houses as well as a part of the food supply. In fact the whole western portion of the territory is well forested. The eastern part, however, notably about Yainax agency and eastward, is to a great extent a semi-desert, sage-brush country. In this eastern region there are many fertile valleys, as for instance, along Sprague and Sycan rivers, but on the whole the territory is by no means so desirable for habitation as that about Upper Klamath lake and Klamath marsh, where the soil is very rich and productive. The old fault line in which Upper and Lower Klamath lakes and Klamath marsh are situated has existed so long that a large area has silted in and formed a very fertile country, which provided in aboriginal times an abundance of various tubers, seeds, and other vegetable foods. Among the most important natural features of this region are the great tracts of marshy land. These marshes are covered constantly with water from a few inches to several feet in depth. In these, particularly in Klamath marsh, is found the staple article of food among the Klamath, and to a certain extent also among the Modoc, the yellow water-lily, *Nymphia polysepala.* Large areas of marsh are completely covered with this water-lily to the ex-

Modoc NS17

M
fish basket, and one or two others. Twining is the only technique K
used, all coiled baskets coming from this region being extraneous
to the true native culture. The majority of the conical burden 285
baskets made of willow or hazel which are in use among the [139]
Klamath are made by themselves, though they do purchase from
the Shasta to the southwest a burden basket which is more nicely
finished than their own. M

Together with this very specialized tule culture, resulting K 105
from the life of the people upon the immediate lake shore, go 22
water foods, particularly wokas and fish, and the special imple- 415
ments devoted to the gathering of the wokas and to the capture
of various animals, birds, and fish. Such for instance are the [133]
peculiar duck arrow, the large dip-net, the net used at night in [184]
connection with a light in the canoe for catching ducks and other
water birds, the many-pointed fish spear, the two forms of bone [501]
hooks, the dug-out canoe, and the forked pole for propelling it
in shallow water. The peculiar stone implements, such as the [276]
two-horned muller, L-shaped and discoidal pipes, and triangular
net-sinker, are also noteworthy.

The specialization of culture in this region is very striking M
indeed when it is compared with the culture of surrounding K
peoples, as for instance, the Paiute to the east, where coiled
basketry predominates and tule work is almost unknown, and 105
with that of the Indians of the Upper Columbia river region to 101
the north, whose culture was very largely influenced by the 171
buffalo or plains Indian culture. A comparison with the Oregon Indians is difficult not only because the Oregon cultures are comparatively little known, but because the majority of Oregon Indians, owing to their habitat, showed either a coast or a desert culture, which is not readily comparable with the inland lake environment and culture of the Klamath and Modoc. The Indians in certain respects most similar to the Lutuami in culture lived down the Klamath river in the northwestern part of California. Here are found such things as the stone maul and the large triangular fish net. Here also the basketry is entirely twined and in a large measure of comparatively soft materials; and the willow or hazel burden baskets are very similar in their general appearance, form, and particularly in the border finish.

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 125
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common 101
experience and status as Indian in contrast to White, the contemporary Klamath
may be considered as one people. This section consists of a sketch of today's 177
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the
reservation's population. 162

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 13
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological [184]
aspects of these water courses were essential to the aboriginal Klamath economy,
as they are essential to the recreational hunting and fishing of the present [224]
population, White or Klamath. [226]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly
White culture. For nearly a century they have maintained multiple loyalties: 648
to the Agency, which represents the Government, to the Tribe, which was an ar-
tificial construct and has seldom been a viable corporate group, to the local [829]
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet
in the same years the Klamath have also acquired and learned much, and it would 178
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-resi-
dence with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White [181]
men of the Klamath. Instead, there has developed a variant socio-cultural
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been trans- 648
ferred to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not
utilize these resources. These latter homesteads are little more than rural [241]
slums, the scenes of perennial drinking parties. For decades the timber indus-
try has been the mainstay of the local economy, but relatively few Klamath have [511]
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

Carrie: Male, Age 36

Background Data

156 Carrie is the model of a self-made, upwardly mobile, brash and back-slapping
*159 young American male. He is a tribal leader whose power is rooted in an amalgama-
tion of various dissident elements, rather than in a large kin group, and a
[622] business man with numerous interests. He says, of himself, that "I have no
occupation, as occupations go. I guess you might say I am a confidence man."

*159 Like the other subjects, Carrie was raised on a ranch by his parents. He is a
high school graduate and a graduate of a junior college course in accounting.
[873] His work record suggests his ambition and his upward progression, for he started
as a farm laborer, went to truck driving, then worked during World War II as
[464] a production machinist, completed his education, then worked for the Agency and,
finally, was able to settle down to living off his several sources of income.
He has never been out of the state except for short business trips. He spends
most of his time on the reservation attending to tribal and his own business,
156 and participating in various voluntary and formal associations. More recently
*159 he has become active in politics on a local level and by some has been ear-marked
as a "comer." His intellectual horizons are very wide, extending to a keen
[66] awareness of the difficulties faced by Dag Hammarskjold. His reputation is ex-
cellent and he is particularly esteemed by many Whites, although this esteem is
[622] not shared by all Klamath, which reflects only the factionalism of Klamath politics
and, perhaps, the efforts of some to control a man who is too successful.

*[184] Carrie has been married once and this marriage has lasted 15 years. He has six
children and his family life, again, is precisely what might be expected of a
successful young American. Carrie's entire style of life is entirely different
from that of most other young Klamath men.

*159 Very little is known of Carrie's early life except that his background is rural
Klamath and that his mother was a housewife and his father an indifferently and
intermittantly employed laborer.

156 The writer never made much headway with understanding Carrie until the day he
124 was brow-beaten into taking the Rorschach. Before this time he had been seen
only as an aggressive, back-slapping, competitive, and somewhat empty character.
He had agreed to testing, but had managed to slip out of several appointments
until one day when the entire couplement of field workers descended on him during
a visit, arguing and insisting that he had to set the example. Carrie was thus
hung on his own petard, and when we walked into the testing room there was some
question as to who was the most fearful of the consequences of this episode,
Carrie or the examiner. Carrie was manifestly tense and fearful, but in a very
short period of time relaxed and accepted the test situation. Rapport was ex-
cellent, and Carrie clearly defined the situation as one where he should discuss
156 his private concerns, motives, and sentiments. From sessions like this it be-
came evident that Carrie's brash front consisted of a set of behaviors he saw
as appropriate to his position. That is, the social Carrie was a well defined
role. Behind this persona lay a genuine concern with the welfare of tribal
members and their future, as well as strong personal aspirations, deep committ-
ments to family and community, and fears associated with his private feeling
that he was not an adequate or relaxed "mixer." He stated, for example, that
"I guess I just don't have the courage to get out, even among my own people.
I'm not much of a talker and I guess you'd say I'm kind of backward. I really
prefer to be alone by myself." Some of this apprehensiveness is associated

Aunt May: Female, Age 58

Background Data

*159
[156] Like Carrie, Aunt May's social position is marginal to Klamath and White seg-
ments of the community, and she occupies a position of leadership, although
[184] hers is of a more informal variety. She has 8 years of formal education, but
in her words, has been learning all her life. She has been married four times.
[871] Two marriages were broken by the death of a spouse, one by divorce, and the
[586] fourth, to a White wage worker, to whom she has been married 20 years. One of
the tragedies of her life is that she has never been able to conceive, but she
[842] has made up for this biological failing by formal and informal adoptions of
numerous children, four of whom she had for at least for three years, and one,
[597] an adolescent boy, since birth.

Unlike many of the other subjects, Aunt May is a town girl, although she has
spent some time on a ranch in her youth and would now prefer to live in the
[756] country. When she was young she seriously considered becoming a Shaman, and was
closely identified with one of the surviving "Indian Doctors," but she became
dissatisfied with the prospects of this role. Yet she remained ambitious and
[874] wanted something more for her life than the "other Indians" were getting. She
took up with a white woman who put her to work and trained her as a seamstress.
[759] She became an accomplished mid-wife and frequently will answer to the query if
she knows a certain party, "Do I know him? Why, I cut his umbilical cord with
[857] a pair of my nail scissors." When a small girl she held the role of a "child
nurse" and more or less raised the remainder of her siblings. In recent years
*159 she was literally dragged from her home by a group of white ladies who wanted
156 her to attend their church, a [illegible]rch, which as a girl, on Sunday mornings she
had stood outside, wishing she [illegible] enter. She is the social center of gravity
177 for two large but separate ci[illegible] Klamath and Whites. She is one of the
184 few Klamath women with whom el[illegible]hite ladies will associate, and with them
her position is so esteemed and secure that an invitation to her house is highly
[794] valued. For her Klamath friends, relatives, and "pick-up" relatives (i.e., per-
[608] sons she has taken to her bosom as her own flesh) she is a confidant, an ad-
visor, and an out-spoken critic. She is out-spokenly critical of many patterns
*159 of contemporary Klamath life, particularly excessive drinking and disordered
156 family life. "When I was a young woman I just stopped drinking. It was making
a mess of my life. I didn't want to be a wet blanket, though. I still went to
[278] dances and all. What happened was that I told the boys that I had broken my
glass." Aunt May's home today is one built with her share of tribal income,
[353] spotlessly clean, well furnished and homey. Every room of the house has its
walls and corners covered with mementos and souvenirs, each of which is asso-
ciated with a treasured memory of a particular person and association. It is
noteworthy that these memories are her personal property and do not include her
[571] husband or adopted son. Most of her current social contacts are with Whites,
for although other Klamath visit in her home, she never visits in theirs, be-
cause she does not want to get involved in their arguments.

[157] Aunt May is an extremely assertive woman whose tongue is too often sharp and
biting, but every criticism is immediately followed by an effort to soften a
person up, reflecting her extreme sensitivity to personal relationships. Perhaps, like Carrie, this strong joking behavior constitutes an appropriate social
role. Aunt May is equally sensitive to the reactions of others to her and she
will call friends to task for imagined snubs. In public she sits erect and
quiet, yet attentive to all that is going on about her, and with great care

NOTES.

*539 With the exception of the first, these ethnographic notices concern the people composing the southern chieftaincy as much as those of the northern.

184
171
115

I. The four items of section I are worded in the Klamath Lake dialect, and were obtained from Frank, a young Indian settled at Kuyamskä'-iksi, "the Crab's River-Trail," on the Williamson River.

90, 1 etc. The census figures given in the first paragraph refer to one of the latest counts made of the individuals in the tribe, probably to that of 1876.

90, 1. vunépni lalák̲i gítko. Correctly worded, this phrase would read vunepä'nash lalák̲iash, or vunépnish, or at least vunépni lalák̲iash gítko.

90, 2. pé-ulatko ought to be used only when units are mentioned after the decads of figures. If the relator wanted to say, 180 men were counted, the verb shä'tui, shétui would be the proper term. Cf. *Note* to 70, 8. 9.

90, 3. Tumántka, "by the many", by the crowd: by the majority of the men in the tribe.

90, 7. hishuátchχash is a form for the word *man*, *male*, common to Klamath Lakes and Modocs, but more frequently used among the latter. The reverse is true of the form híshuaksh.

90, 10–13. Part first of the fourth notice refers to dances at the communal dance-lodge, organized and directed by chiefs. The chief starts the songs; sometimes the men, sometimes the women sing in chorus; or a song may be sung by all present. When the chief sees one, who does not sing, he cries out: "i tchuín; túla shuín i!" All dances are accompanied by songs or other music.

90, 10 ul probably stands for ûn, û'n, û'na, a conjunction more frequently used in the Modoc than in the Klamath Lake dialect.

795
771 reservation residents are not attracted. Like its more dramatic predecessors,
178 the Shaker religion fails as a bulwark against societal disorganization.

182 The modern Klamath are in the main nominally Christian. Many are
allied with local churches: Protestant groups attract a fair following; some
771 are Roman Catholics; others now and again join the itinerant Pentecostal
795 and Holiness groups. While many Klamath are unquestionably religious in
184 the accepted Christian sense, the church offers a primary social outlet to
797 those who value group association. Whatever the function of the church on
the reservation today, apparently it has no aboriginal vestiges in its ritual
571 or organization. It would be impossible to say to what extent tribal members
find a link with the native past in the spiritual curing practices of such bodies
as the Pentecostal Assemblies of God, which, however, clearly make no concessions
to aboriginal concepts.

771 It thus seems evident that the overt forms of tribal religion are gone. The
177 Klamath majority is now avowedly Christian even though church affiliation
is not universal. Religious attitudes seem highly diverse. Some individuals,
184 while indifferent to religious tenet, are admittedly attracted by the display
or by social opportunities. Some are devout, others ignore the churches entirely.
Still others, whether or not church members, speculate on religious
questions, show considerable introspective preoccupation, or are frankly
curious about native religion and Christianity. Their opinions and attitudes
755 demonstrate that the aboriginal past is not wholly dead. In this consideration,
757 shamanistic curing may be ruled out, since modern medicine is generally
accepted by the Klamath and, in any case, shamanistic patterns have merged
with the decaying Shaker Cult. Since this is so, the less formalized aspects
of the aboriginal religion survive to intrude now and again into modern conceptualization.

183 The survival of cosmological features may still be observed here and there.
773 For example, tales of people and animals turned to stone by Crow's laughter
are half-credulously recounted by young and old. A surviving custom or two,
183 reflecting the older world-view, might also be noted. A boy who kills his first
224 deer is well advised not to eat its meat himself. By giving the game away,
he averts failure in his next hunting expedition. Hunting on the reservation
today is a sport, no economic value being attached to it. (Aboriginally too,
the Klamath were so well adapted to their specialized lake-marsh economy
that hunting played a distinctly minor part.) This custom, which may stem
from the emphasis on wealth and generosity, is laughed down today but it is
825 still practised. Another very common belief is that animals can speak Klamath
191 but not English. A howling coyote is recognized by young and old as a harbinger
763 of death; the owl says, "'Maklaks, 'maklaks," which "when you hear
it, it means somebody close to you is going to die." The Klamath word means
183 human and refers to the tribe itself. Taboos on the first game of the hunter,
the first wild foods gathered, as well as fear of the owl are widely distributed
among western tribes.

178 But more pertinent here are the modern Klamath views based on the past
which either influence actual behavior or bridge a gap, conceptually, specu-

773 That's why Kemu'kemps disappeared when Christ came. But then I remember
776 them talking when I was young about how Kemu'kemps was coming back.
777 That was all lies so I guess Kemu'kemps must be the Devil. Still, they say
he created all just like God. I don't know how to figure it."

Mention was made above that the culture hero had a son who was born miraculously. The possible relationship between 'Ayšiš and Jesus has caught the fancy of some. A man of seventy comments: "Yes, Kemu'kemps and God are one and the same. There's a story that says how Kemu'kemps saved a woman's baby when she jumped into the fire and that baby was raised as his own son. I don't believe it. God created all living things. He made the Devil, too. I think 'Ayšiš is the Devil because he's always trying to get the best of his father. We old Indians knew about God but we didn't know about our Lord and Saviour, Jesus Christ."

A 56-year-old woman remarked: "Yes, Kemu'kemps is God and he had a son, just like Jesus. 'Ayšiš even dies and comes alive again in the old Indian stories, and that's like the Christians teach. And that Holy Ghost business, that's the power that God gives. The Indians knew about that. That's why you say 'Father, Son, and Holy Ghost.' "

But so concise a syncretism of aboriginal and Christian religious elements
184 is rare. Younger people vary greatly in belief. One man, about thirty-eight, noted: "Kemu'kemps? They told us stories about him when we were kids. They said he's like God. It doesn't matter to me. Maybe he is; they always say how he made everything around here. Maybe he did; things get that way somehow." A 31-year-old woman remarked: "Kemu'kemps stuff is what they tell kids. That's old Indian devil-talk. I don't know nothing about it." And a 16-year-old girl stated: "I've heard my grandmother talk about Kemu'kemps. That's kind of scary stuff like the dead coming back to haunt
823 you. There's a cave up on the Sprague River where they say Kemu'kemps used to live. Maybe he still lives there. Anyway, I wouldn't walk up that road in the dark."

A woman of about fifty-five, when questioned about the religious training
869 she gave the grandchild entrusted to her care, answered: "Children learn about the Bible very fast. I tell my granddaughter the old Bible stories and she likes to hear them. But I steer off of that old Indian stuff. I think we ought to get away from those old Indian superstitions. I'll sure get mad if anybody scares her with stories about those old Indian things like Kemu'kemps."

Her statement sets the tone for the future. The old beliefs are being lost, and although still very general, they stand out most vividly only in the minds of those who were raised in the period of the second Ghost Dance and the analogous revivalistic movements which followed it. While they obtained, during their upbringing, a detailed background of native Klamath mythology, they succeed, according to their own inclinations, in passing on their point of view to their descendants, or they may fail to do so. The attitudes indicated above are individual; no debate about the nature of Kemu'kemps or related
795 concepts has been noted. While the formally organized religious groups, including the Shakers (however dependent on the aboriginal patterns of

estranged themselves from Klamath society. Few, indeed, had 648*
attempted to cross the chasm; and fewer were able to straddle it. 657*
Klamath, on their part, entertained strong prejudices. Some 563
were matters of ancient history. Klamath and Modoc were dis- 571
dainful of Paiute and Pit River, and the epithets, 'daughter of a [186]
Paiute!' or 'slave!' still stung. At the time of allotment, when many members had come back upon the reservation, while the numbers of those calling themselves Klamath had soared, the absolute number of Pit River had declined. Evidently, members of mixed parentage were passing into the more prestigious category. Toward other minority groups tribal members displayed various attitudes. Indians from nearby reservations were generally well received, but those from afar were resented, particularly if they held Agency jobs coveted by the Klamath.

Whites tended to lump all Indians together, and the accomplishments of some nonlocal Indians elevated the general Indian status in the popular view. Nonetheless, tribal members were wont to regard them as trespassers. Toward Mexicans, with whom they occasionally intermarried, they were on terms of approximate equality. Negroes were viewed with strong disdain and two tribal families of part-Negro ancestry often were the object of pointed remarks.

Among themselves, Klamath also sometimes reflected the biases 648*
of the major society. Younger men have been heard to express 657*
a preference for a wife of lighter pigmentation. The epithet, "You 829
big, black Indian!" was occasionally hurled between angry children; and one woman who reported this recalled how shocked she was, in her early teens, when she realized that it was true, that she was indeed an Indian. Against the valuation on light color there is, however, another view. Those of darker hue not infrequently voice their pride in this token of racial purity, and some speak disparagingly of the "half-breeds," alleging that they stem from lewd intercourse with the soldiery of old Fort Klamath. One young leader with a high degree of Indian ancestry, in considering the division of tribal property under termination, ingeniously proposed that each member receive a share proportional to his direct biological Klamath heritage. In the end, pigmentation offers no certain index of ethnic self-image: for

Weasel: Male, Age 29

Background Data

In contrast to all other subjects Weasel's role in the reservation community 159* is a totally negative, destructive one, largely that of a supposedly vicious [156] criminal. He was born and raised on an economically un-productive ranch, which for twenty years or more has been the location of continuous drinking parties. [593] Weasel was raised within a circle of a pack of older brothers, half-brothers, and step brothers, all of whom were bigger, stronger, and more capable than he. [733] His father has been an alcoholic for thirty years and has rarely worked or contributed much to the organization of the family, which as a co-residential [592] household usually included more than a dozen persons. In all, Weasel had 17 [165] full and part siblings, half of whom are now deceased, three directly as a result of drinking, three from acts of violence or car accidents.

Weasel's formal education ceased when he was 15, in the ninth grade, at which [871] time he was arrested on a burglary charge. Since then he has spent six years [674] in reformatories or penal institutions. He was tested while in jail on an assault charge. [697] Shortly thereafter he was found not-guilty, then re-arrested and sentenced on a different assault with a deadly weapon charge to three years in the state penitentiary.

Weasel has repeatedly moved out of the circle of the family group, only to fail "outside" and return to its sheltering arms. [542] For a time Weasel was a professional boxer, but one without much skill or stamina. He never won a fight and his face shows the evidence of the capabilities of his opponents. His membership in this profession did not last long, and Weasel states, rather proudly, that the Boxing Commission expelled him "For conduct unbecoming a professional boxer." Weasel was once married [588] (a common-law marriage, which for Weasel's primary reference groups is well sanctioned) [581] but this lasted just 16 weeks. During this period Weasel stayed sober, the longest time he has spent without a drink since the age of 12. [733] Weasel was consciously trying to reform himself, but now feels that he was a fool to ever try. Additionally, Weasel has repeatedly made a circuit of nearby towns and cities either singly or in [156] the company of a brother or friend. [579] These visitations have more of the character of raids than anything else, and Weasel is usually arrested in one or another place and either charged or shipped out of town. [697]

In addition to being a minor criminal Weasel is frequently also the scapegoat 159* for the aggressions of stronger men than he. 156 He constantly asks for trouble, but has never given any evidence that he can back of his threats with appropriate force. [186] His successful acts of aggression have always been sneak attacks, or attacks on feeble old men or young boys. He seldom attempts to avoid the consequences of these actions, and, indeed, is frequently not able to do so, because of his extreme drunken condition. He seems to obtain some gratification from the minor prestige afforded his performances in these roles, but this gratification is highly personalized and is not recognized as appropriate by others. It may be that he has been attempting to build up his standing and reputation within his own circle by acting out the role of a "dangerous Indian," but it would seem that he has been singularly unsuccessful in this. One aspect of this behavior is his reputed skill with a knife. On two occasions he wanted to obtain vocational training, once as a barber, the other time as a butcher, both times implying that this would be a simple extension of his native talent.

7:Gatschet . E-4,5 (1877) 1890 NR10 Klamath NR10

772 months brings on the seasons with the new life seen sprouting up everywhere
773 during spring and summer. So the quadrupeds and birds which are
776 the first to appear after the long winter months are considered as the wives
821 of Aíshish, and the flowers of summer vegetation are the beads of his garments. He enjoys more popularity than his father, for the moon's light is mild, not burning nor offensive, nor does it dry up vegetation and make men and beasts drowsy like the rays of the midday sun. Many nations also believe that the changes of weather are partly due to the phases of the moon. Although the "Birth of Aíshish" myth obtained by me represents Aíshish rather as the adopted than as the real son of K'múkamtch, other myths state him to be his son resulting from the union of the sun-disk to the red sky of the morning or evening, symbolized by the woman Le-tka-
[19] káwash. We must recall to mind that the term for *father*, p'tíshap, in Modoc t'shíshap, is really the *nourisher, feeder*, and not the progenitor, for it is a derivative from t'shín *to grow.** Most other mythologies consider the relation of sun to moon as that of man to wife, or of wife to man (cf. Deus Lunus), but here the thing is different. There are no female characters of importance in Klamath mythology, nor does the language distinguish grammatically between the sexes.

821 The difficulty which we experience to distinguish solar and lunar deities
171 from each other in some of the American religions is caused by the
197 circumstance that in many languages of this western hemisphere the term for *sun* and for *moon* is the same. In such languages both orbs are distinguished from each other by being called day-luminary, or night-sun, night-luminary, and with some tribes the belief has been found, that both are actually the same celestial body, one being merely the image or shadow of the other. In the Maskoki languages hási answers for both, but the moon is commonly called ní'li hási or "night sun." In the Tonica language táχtchiksh, abbrev. táχtchi stands for sun, moon, and star, but the moon is usually named lá-u táχtchi "night luminary," the stars táχtchi tipulá, while the sun is either áχshukun táχtchi, "day luminary" or simply táχtchi. Of the Tinné languages many have tsā, sā, of the Algonkin languages kísis or parallel forms for both celestial bodies, separate distinctions being

NOTES.

[124] [175] 16. Dave Hill took part himself in one of these skirmishes. His historical accounts are all given in the conversational style, which almost throughout substitutes the simple *s* for *sh*. I have not been able to determine the exact dates of these Rogue River raids; but they must have occurred before the end of 1855, when the Oregon war broke out, for after its termination most of the Rogue River Indians were removed from their old homes to the coast reservations of Northwestern Oregon. The raids occurred in the early youth of Dave Hill, who was born about 1840; so they may be placed between the years 1848 and 1855.

173 *539 726 19 16, 2. tínatoks forms antithesis to tína of the preceding clause. The literal meaning of both is: "one time ..... the other time."

16, 3. Wálamsi. The suffix -i, -í, is the adverbial particle hí, and forms a *locative case*, mainly found in local and topographical terms, as in Yámsi, Kakágosi, Ktaíwashi; also in a few generic nouns designating localities, encampments, mountains, etc.

16, 5. shûshû'dshapĕlish. The suffixed -sh is the pronoun sha, *they*, and in this suffixed form also appears as -tch, -s. This verb stands in the distributive form; shúdshapĕli, to rebuild a fire, being the absolute form.

16, 7. nánχatch, for nánχa tchish, "others also".

16, 10. yákanuapkuk, verbal causative of the future of yákna. The forms yä'kna, yä'ka, yékna, yéka, are preferable to yákna, yáka.

[727] 16, 11. sá-atsa. It is a common custom among western, and some eastern, wild tribes to force their captives to dance in honor of the victory gained over their own tribe. This is done especially during the scalp-dances.

16, 14. Titná lû'ka, etc. Here begins the account of a raid made by the Rogue River Indians upon the Klamath Lake settlements. It may have occurred one year after the raid previously narrated.

16, 15. sapíya, etc. After escaping, he informed his own countrymen of all the local conditions of the Klamath Lake people and their country, and used all his topographical knowledge in guiding their warriors to the attack.

17, 1 and 2. Tsúi nĕ'lka. Indians and uncivilized races in all portions of the world begin their raids upon the enemy before dawn, or at the earliest appearance of daylight.

17, 9. gäkán and geknánapka, inflectional metathesis for gäkná and gekánnapka.

17, 14. huṣhtchŏ'ktat for hushtchŏ'kat ät, ät (*ye*) being repeated twice.

17, 16. tsókapka tcha is a contraction from tsokápkash tchí'sh a.

17, 17. Tchíssa, for tchí sha: thus they.

17, 20. sellólok: synizesis of the longer form shéllualuk, shellualúga: through fighting.

17, 21. yuyálks=sitk, abbreviated from yuyálkish=shítko, looking like persons mourning over their lost companions, or made sorrowful by bondage to Indians of a foreign tribe.

---

[19] [11] /le ča·nink dwantga doLi·s woli·na/ and /le ča·nink dwantga· lagi· neaga/ are mythic utterances and are only partially translatable in terms of the present corpus. /le ča·nink/, translated by Mrs. Ohles as "I wish . . .," may be the negative particle (le) and some form of (ča·ń) "to not know how to do." /dwantga/ "with what?, with something" is clear. /doLi·s/ may be analysed as ‖dʸoLys‖. (dʸ) 45-v "to act upon a single erect object, stick up"; (oLy) 10sv "into, inside"; (s) 34sv "noun ending": "erect object sticking up in." /woli·na/ contains (w) 45-v "to act with a long object" and (oli·na) 10sv "off the side, edge." Mrs. Ohles stated that this item seemed to mean "whittle," but she was not certain. The remaining forms (/yoho·/, /lagi·/, and /neaga/) are clear. Both utterances are "sung" in a high, faint, far-away tone, trailing away at the end into voicelessness. They are delivered in an even, rhythmical metre, stressed vowels being abnormally lengthened: /le čá·nink dwántga doLí·s wolí·ná/ and /le čá·nink dwántga yohó· lagí· néagá/.

---

[19] [36] The sequence /?o···ĺ, ?o···ĺ/ represents Dove's cry and forms the onomatopoetic basis for this bird's name. This utterance was given in a faint, high, far-away voice. The faintness of Dove's cry made Sqeĺaṁč's pursuers believe that he had outdistanced them, although he was really close by.

[124] [37] At this point Mr. David recalled a portion of the story which he had omitted. He explained that it should have been inserted somewhere near Sentence 83 of the present text. Sentences 107 through 111 are more or less a résumé of the action, resulting in the killing of Le·w. Sentences 104 through 106 were improvised material giving continuity to the story in spite of the error. Sentences 112 through 127 form the main part of the omitted section.

Northern Paiute NR13

K 721 648

The topography directs Shasta attacks against southern settlements. Coming by the open country along the Klamath river, they attack iwau′wönx at Klamath Falls, sometimes swimming the river there. Or they cross by the little island to the south to surprise the settlement on the east bank. Many years ago a large body of Ya′mökkni, northerners, descended on the Klamath on Sycan marsh in the northeastern corner of their territory. These may have been marauding bands of Shoshoni and Bannock, fought by the soldiery of Fort Klamath in the summer of 1864.[43] Henry Renier, an old settler, told me of Indians coming south about 1876 or earlier by way of the Warm Springs country from the Snake river range east of Lewiston, Idaho. K [174]

NP K [191]

Northern Paiute scouts use various calls in order to keep contact with one another, imitating the crow by day, coyote in the evening, and owls at night; unlike Klamath scouts. When these are heard, women and children take to canoes, staying on the water until morning. The screech owl is thought to call, kökxdĕ′l sḳiu′ki′u, who sent me? A thrush (sḳo′′lĕ) names who is coming, wī′mpis xge′pkwa, they are coming.

K 721 648 [727]

Klamath hunting in the Cascades might meet Upland Takelma from across the range. On one occasion (perhaps about 1850) a party of five or six was wiped out with the exception of a boy who made his way at night, arriving footsore at Klamath marsh. Those who fetched the bodies for cremation found that the Takelma had taken scalps, hands, and feet as trophies. Two of those killed were brothers to the maternal grandfather of my informant, Coley. A wife of this grandfather was an Upland Takelma woman, perhaps a slave, who was a sister to the Upland Takelma chief Töḳtö′ḳli ′red). They killed her in revenge. She had been living among them at the marsh for years but had no children. The reciprocal raid can be reconstructed from Gatschet's information[44] and my own. The expedition was undertaken at the call of Lxle′ks, the most prominent ă′ukckni chief and a distant relative of Coley's grandfather. Men of all the tribelets took part. Crossing the mountains on foot, they found the Takelma encamped in Molala territory at the head of Rogue river. They attacked as the Takelma rose at dawn, scalping many and carrying off women and children. Among those killed was Töḳtö′ḳli, whose hands and heart they took. After the man was shot, Lxle′ks lanced him through the throat. Lxle′ks invited all the Klamath to a huge scalp dance at Klamath marsh. During the dances a wife of Coley's grandfather danced about with the heart in her teeth. The captives were dragged by their arms and forced to dance close to the fire. K [727]

K 726 535

A preparatory performance, called nī′ḳĕba, is an indispensable preliminary to a raiding party. It can hardly be styled a war dance,

---

[43] Gatschet, 1:lxii.

[44] *Op. cit.*, 1:16.

411 726 the shaft is withdrawn. The tips are not poisoned.[48] However they believe that those made of obsidian obtained on a mountain west of Klamath lake are poisonous. A tale has it that an Upland Takelma [539] shot a presumably mythical man, called Teewis hu'lūms (alighting flicker), there. Crow laughed and he turned into the pillar of rock still standing. This is presumably the widely known tale of the shattered rock-monster. 701 A war leader, a rich man, carries several quivers; one under each arm and a third across his back. 411 The short stabbing lance is stone headed; the club simply a straight stick or one bearing 714 a knot for a head. Armor is the familiar long skin tunic and wooden slat armor of waistcoat shape. The round hand shield is used, but not the curtain shield, i.e., a skin hung before the body. Sock-like skin gloves sometimes protect the forearms.

726 It is planned to arrive in enemy territory at the end of the day. Several good runners are sent forward as scouts (gau'ulū'ḳdja) to [191] look for smoke from enemy fires. Scouts do not use animal cries like those of the Northern Paiute. [171] The camps are surprised at dawn, for, in addition to the confusion, there is the advantage of a long day in which to make good an escape. Yet the fight may last several days, I was told, but it is more likely that the raiders withdraw at once unless beset by a rallied foe. One thing sets off the intensity of this conflict from that of the Arizona Havasupai as I found it; there never occurs here the gesture of bravado of drawing off for refreshment before [554] returning to the attack. Yet there is something formal about these fights too; the leaders make a point of engaging with men of like rank in the forefront of battle, although they do not disdain lesser men. Warriors do not pat the mouth as they charge (go'lgi); this is done 727 only in the scalp dance. The foray usually ends with the fleeing of the ablebodied among the enemy, the killing of the infirm, and the capture of women, children, and such property as beads and quivers.

[114] These are kept by their captors; perhaps some division of the spoil is made. Disputes are inevitable: Gatschet's informant describes how he wantonly shot down a girl whom he claimed as his due rather than let another have her.[49] Pat Kane told me that all the booty is carried to the principal chief who asks for an accounting of the dead and slaves. The leader enumerates how each man took slaves or scalps and how the opposing chiefs were killed. The trophies of these chiefs are exhibited. I doubt his statement, unless he had in mind the prestige

---

[48] Gatschet's informant credits the Modoc with poisoned arrows (*op. cit.*, 1:90).

[49] *Op. cit.*, 1:23.

648 fishing on Lost river near Olene. A shallow bowl-shaped twined
[439] basket, called ķ!we'lu, is obtained from the Modoc, who in turn trade it from Pit river. There is no direct trade with the latter people.

231 Horses were first acquired in any number about 1840. They had
177 been previously acquainted with them in the hands of whites who crossed their country about this time; dates are uncertain. Ogden in 1826 remarked on a single horse seen as though it was a rarity
231 among them.[66] The first sources were Warm Springs and perhaps
177 some group immediately east of that place. These were obtained by chiefs; others were too poor in slaves to buy them. The name given
437 the new animal follows the common habit, wa'tcag from watc, dog. Saddles (pā'olās) were first made of antelope hide. Here, as in the Plains, horses served as a stimulator of contacts, especially with the Columbia river peoples. As I have remarked, their introduction seems responsible for the rapid increase in wealth, the flow of northern ideas concerning social stratification, importance of wealth and of slave-holding, Plains costume, and those predatory habits which furnished the withal to maintain the new status.

237 Buffalo (yo'ho) skins are obtained at second hand; the Klamath know that their origin is east of the Umatilla, that is, in Idaho.
177 Buffalo never ranged into this country, although they reached the
437 Harney Lake district. But very few skins ever make their way into
527 Klamath hands; only men with many slaves can afford them. They are wanted to cover a gambler's hands in the stick game, an opportunity for ostentation.

177 Parfleches (sķō'psōli, folded up) are traded from Warm Springs
437 people and Sahaptins beyond them on the Columbia. They are not made by Klamath.
415

* 171 Incidentally, many older people have fluent command of Chinook jargon. They, or somewhat doubtfully the Modoc, are the southernmost people with whom this trade jargon is current. Kroeber remarks
437 on the fragments in use by Yuki and Shasta.[67] Naturally enough, it
● 191 served a purpose with the Columbia river peoples alone and was of but small value with the whites coming from California.

556 It is interesting to know what constituted wealth among the Klamath, but with the old life now gone it is difficult to get direct evidence. However, certain things alone were spoken of when describing

THREE

[P.45]

The Klamath Agency

THE TREATY BROUGHT TOGETHER TWO PEOPLES, INDIAN AND WHITE, 648* in a program of directed change and marked a termination of tribal autonomy. From records still available, it seems improbable that the treaty commissioners made any attempt to place before the Indians the weighted advantages and disadvantages of the step being urged upon them.[1] They had been directed to secure a treaty and they seem to have argued well its attractive features. Within the Indian councils, the individuals best [623] qualified to speak upon the matter were those who had been attracted to white ways and thus had become most conversant with them. The discussions, carried on through the medium of [191] • Chinook jargon, contained much that was not included in the written treaty, but in the Indian view they were equally binding.

When the Indians passed under the governance of an Agent, 648* they gradually found that their commitments brought unanticipated 657* consequences. The new garment they had donned was another man's suit, not cut to their proportions, and if it was loose in some places, it pinched unexpectedly in others. The system of roles they were asked to assume was in many ways incommensurate with that they had known. They found themselves subjected to constrains that often seemed harsh and uncomprising and that were circumscribed by obscure administrative rulings which seemed to have little bearing upon their advancement.

Although there was some comfort in the knowledge that all were taking the step together, the new life yielded rewards to a somewhat different array of qualities and skills than had the old; and some persons surged forward while others lagged or held back. The relatively homogeneous society of native times, already somewhat diversified in the days of early contact, now

An apprenticeship system had earlier been set up, with an Indian assigned to each artisan as assistant and understudy. Nickerson noted in 1882 that while "[the apprentices] are doing as well as uneducated Indians can be expected to do, not one of them . . . has had any school training, and but one can write his name."[17] Presently schoolboys began to take over some of these positions. 648* 657* 872

Many factors bore upon the effectiveness of the teaching. Elderly individuals today can recall the first bewildered days at school—sometimes relieved by the kindness of such teachers as one nicknamed by the children "Hummingbird"—but at best it was a difficult experience. "Nine tenths of them," wrote Emery of the newcomers, "know nothing of [English]. At first, when called to recite, they will dart under the seats, and have to be coaxed and helped from their hiding places by the hand of the teacher."[18] Not always was such tenderness displayed. Although one man, now deceased, recalled a generally pleasant experience and the kindnesses of matrons and teachers,[19] a contemporary bitterly recollected: 648* 657* 872 876

> In school they didn't allow us to talk in Klamath. We were punished if they caught us talking in Klamath. They would make us hold up a stick with our hands high. Sometimes they would make an older boy hold a fence rail on his back and walk around a tree stump. Sometimes one whole hour at a time. I never had to do that. Sometimes I would see the teacher or principal whip a boy with a good-sized willow. Sometimes they would make the boy take off his shirt and then the boy would never get over it. I felt that sometimes we boys should get together and give the teacher a whipping to see how he liked it. In the old Klamath days, the parents would switch the child on the legs or sometimes on his butt, but never that way—hard like that. . . . [191] •
>
> At school I had it pretty tough. I was cold and hungry. When we made noise at table, we had to be punished without any food. I had to take food from the table. Fish at night. The children had to steal apples.

Detailed as meatcutter, he recalls that the choicest cuts went to employees, the necks and ribs to the children. And he concludes, "I learned how to steal at school to keep from going hungry."[20]

There were games and ice skating, and the brass band. For the adolescents there were illicit sexual adventures. Some children 648* 657* 872 [857] [883]

another figure, known only as "The One Below," to represent the 648*
Devil. This figure appears in a Klamath version of the Garden 657*
of Eden recorded by Gatschet[29]—a tale no longer recalled today. 776
The identification of Gmukamps with God is strengthened in 177
Indian eyes by his mythical foster-parentage of the hero, Aisis. 178
As one Modoc, a fundamentalist preacher, has put it:

> you know, Gmukamps and Aisis—that's nothing but God and Jesus. The Indians knew the story of the Bible, but they were ignorant in those days. They thought that the lakes they performed their miracles around were the Klamath lakes; they didn't know it was really the Sea of Galilee.[30]

Looking back over the entire field of change from the last 657*
decades of the nineteenth century, the observer could discern 648*
major acculturative trends. The Klamath who entered upon the 177
treaty had already undergone pervasive, though largely undirected 178
modification. Thereafter, they were subjected to a consistent policy of change which, despite defects in execution, outside interference, and an intervening war, was maintained for well over a generation. Within this frame, a reservation culture had taken shape, embodying a synthesis of white and Indian lifeways. By the middle of the next century, only a handful of tribesmen would be left who could report from direct knowledge events of pretreaty days; the remaining elders would be products of the synthesis.

Measured by the indexes which the Bureau employed to
register progress, the advance was evident. When that formula- [464]
tive period was ended, a large number of the Klamath were [511]
productively engaged in work of "civilized" character, and their
material wants had come to approximate those of their white
neighbors. Many were conversant, and a few literate, in English, [191]
and their numbers were increasing steadily. The extended family, [212]
at least among the progressive, had made way for the more [596]
mobile and assimilable conjugal family. In the schools, a new [594]
generation was being trained to embrace as natural and desirable [871]
a way of life which the Church, in turn, commended as good to
old and young alike. Expectations seemed to lie within the grasp
of those willing to work to achieve them.

Beneath the surface upon which these changes could be traced, [571]
however, lay cleavages and disconformities as yet unfathomed

grandchildren, she was a familiar figure in boomtown Chiloquin. 648*
Cured by the Shakers, she almost joined the church, then changed 657*
her mind. From her bed, she discussed a life-way that was an 159
indissoluble blend of diverse elements integrated by their personal 178
import. When she narrated or discussed a Klamath myth, 177
her assimilation of a Christian ethic was evident in the delicate 156
manner in which she skirted obscene passages. In admonishing
her great-grandson, she spoke in the traditional manner, but in
English, the only tongue they shared. The English she spoke, like [191]
that of her boarding-school contemporaries, was likewise syncretic;
for it bore the impress of Klamath sound patterns and grammatical
categorization.

Individuals such as she, often happy to escape from the gray 648*
reality of age into nostalgic memory, initially struck the observer 657*
as conservative when contrasted with the young people: the boys 156
in Levis, cowboy boots, and leather jackets, the girls in jeans and 177
plaid shirts, who spoke little or no Klamath, and who loitered 178
in the cafes of Chiloquin hanging on the heavy beat of the jukebox.
Yet at most, such folk were old-fashioned, and still retained
the tastes and inclinations of long habit. Their commitment was
selective. Those who still liked to dig the roots known as ipos did
so, not with an aboriginal digging stick, but with the more
durable iron counterpart made years ago by the Agency blacksmith;
and they traveled to and from the grounds, not on horseback,
but in the most modern of automobiles.

If there were tribal members who wanted to have as little as possible to do with whites, they did not thereupon stop speaking English or give up their houses, cars, and radios to accomplish this. They continued to purchase food and other necessary items from white merchants. Indeed, their hostility might find short shrift from another Klamath who commanded more knowledge of the traditional lore and still recounted the old myths to her grandchildren, yet possessed many friends among the whites.

Clearly, there was at Klamath in the latter days of the reservation 648*
no clearly distinguishable category of the "native-oriented," 657*
in the sense of a preferential adherence to the institutions of 177
native life. Deliberate retentions rather served as the diacriticals 178
marking an ethnic nationality.[20] The use of the Klamath language [191]
to signify an Indian estate was one marker. It might be used on

[Klamath Reservation]

*648 formal occasions in the General Council in a demonstration of
*657 decorative oratory; and there it might also serve a speaker to
177 shut out a heckler who knew only English. In such a session, a
178 member in the audience, although fluent in English, might de-
• 191 mand the services of an interpreter for the purpose of underscoring his Indian status. Similar functions were served when Klamath was spoken in the presence of whites. The ability to shift from one language to another, or from one behavioral modality to another, was akin to the behavior which Polgar has described in the "biculturation" of Fox children.[21]

*648 In the latter days of the reservation, there were few occasions
*657 when tribal members came together for traditional events, and
177 the sessions of the General Council constituted the main remain-
178 ing tribal gathering. Such individuals as our old friend mentioned
623 above had their closest and most continuous relations with chil-
619 dren and grandchildren, who by no means shared their outlook.
571 On the occasional visits of their aged peers, these elders exchanged memories and expressed common concerns which were as much the product of the parallel roles they then performed in their respective families as of the time in which they had grown up.

*648 Such accommodation as there has been to American culture has
*657 not only changed through time with alterations in the state of
177 Klamath and American cultures; but at any single time, Klamath
178 have drawn diversely from what was available. Thus, the small
184 number of families in Chiloquin that have attained a measure of social acceptance by whites of middle or high status have done so by manifesting the appropriate life style. In so doing, unless they are able deftly to shift role-orientations, being now Klamath, now white, they have had to sacrifice close relations with their kin. "Some of my family I never see any more," remarked one such woman, "and I don't want to see them." They often forbade their children to play with undesirable tribal children. Insistence upon household neatness, fastidious emphasis upon personal cleanliness, punctuality, and adherence to self-standards usually accompanied these attitudes.

Inframodal behavior among Klamath in turn has by no means been random in form, but has approximated already established patterns in the dominant culture; often combining them in ways

White ethnic exclusiveness is reflected
in minimal Klamath participation in formal organizations, lodges, political 648
groups, scouts, and various clubs. Elite groups such as the Masons are 621
exclusively White, while the elite Methodist church contains a single Klamath 563
member. In the century of contact few Klamath have held elective office [575]
outside the tribal structure, and although a high percentage have registered, very [794]
few vote in local, state, or national elections. The dual structure of local
communities is best reflected in the sharp division of networks of friendships [666]
and home visiting, White on the one hand, Klamath on the other. Clearly, the [571]
place and role of the Klamath is a special one.

Their special status has numerous implications. For years, to obtain their [273]
drinking liquor the Klamath had to turn to bootleggers, a legal disability which [671]
was removed only in 1951. Local law enforcement has sometimes been difficult
due to dual or conflicting jurisdictions, and jurisdiction over major crimes
committed by Klamath was given over to the state of Oregon in 1953. The land [423]
holdings of Klamath property owners, because of their special status, are [651]
frequently tax exempt, as have been their per capita payments. Simultaneously,
the Klamath have exhibited little constructive concern with local affairs. As
was noted, their contribution to the community takes a special form. In [674]
Chiloquin during a typical year arrests of tribal members amounted to 70 percent of
the total, and they also paid 70 percent of all fines and forfeited bails and
performed 96 percent of all trustee labor (Stern & Swanson 1960). The wardship [178]
status has, however, suffered gradual attrition, and in 1954 the passage of
Public Law 587 began the final termination of federal supervision of the tribe, [657]
and the dissolution of the reservation.

Under PL 587 the Klamath were allowed the choice of remaining within a 648
reconstituted "Klamath Tribe," with a corporate structure and assets to be 657
administered by a trustee, or they had the choice of withdrawing and of receiving a 619
pro rata share of tribal assets. In a later election, about 77 percent of the
membership elected the latter, and chose to withdraw. However, the control of
the new "tribe's" assets and the fact that many persons who withdrew have been
designated as "in need of assistance" indicates that although federal
supervision has been ended, the control and intervention of Whites has not.

The separation of Whites and Klamath in local communities is by no means entirely 563
due to White attitudes of exclusiveness or to overt discrimination. Individual
Klamath have shown an equally noncommittal relationship to tribal affairs. 619
Attendance at tribal meetings has been very low in spite of numerous inducements such
as free bar-b-ques. In General Council meetings (and tribal affairs, generally) [665]
the conduct of business is marked by extensive and endemic factionalism, delays,
repetitious debate, failure to resolve or even to state issues, and pointless,
lingering sessions. Here is one place, outside of the telling of a ripe but [191]
dirty joke, that one may hear the Klamath language used; but it is used as a
tool to beat down an opposing tribal member who does not understand it. Though
the General Council and the Tribe are symbolic of a corporate separateness and
of a Klamath identity, this minimal participation and the distrust of the ability
of tribal leaders to manage the tribe's resources weakens them as systems of
action.

Klamath families are another important locus of loyalty and identification. 592
The household or domestic group itself averages about four members, but there
are many single male households and many domestic groups headed by women.
The latter is symptomatic of the instability of the marriage tie. Marriage, 581
in the legal sense, is itself approximated in frequency by common-law unions [588]
and more temporary "shack-jobs." Probably one-third of all Klamath women have

Sparrow: Male, Age 63

Background Data

*159
156 Sparrow's case is cited because of his position on the lowest rung of the local
status hierarchy. He is known as a happy-go-lucky, worthless old drunk and is
generally considered as "lacking a few of his marbles." However, Sparrow is
872 seldom publicly disparaged, for local citizens simply pay little attention to
464 him. He has a sixth grade education, gained at the Agency school. He has
apparently never worked consistently at any job, and most of his work experience
434 has been as a farm or ranch laborer. He is and has for years been totally dependent upon per capita income and the income from ranch lands owned by his mother,
with whom he lives. Their affairs are managed by a local businessman who some
years ago was appointed their guardian. He is the second eldest of four siblings.
After his father's death forty years ago, his mother remarried and bore two other
586 children. He was married once when a young man, and after four years divorced
his wife because of "her shiftless ways." He is a semi-invalid, the result of
164 an accident years ago when a drunken brother drove over him with a truck, crushing
191 his pelvis. He speaks fluent Klamath, the result of constant association with
his aged mother who represents a direct link with the aboriginal Klamath past,
as well as adequate English, learned in school.

733 Much of Sparrow's time is spent in jail for drunkenness, in the local tavern,
with one of the drinking cliques, or passed out in a doorway. When he is not
totally drunk he spends much of his time with his mother, for whom he cares in
his fashion. Occasionally he goes fishing in a nearby river. For at least
twenty five years, this has been the pattern of his activities.

*159 Sparrow has many skills, among the most striking of which is the ability to
"fly from here to the Agency without once touching the ground." There are
154 several dimensions to this delusion, one of which is an association, in Sparrow's
thinking, with the acquisition of power. When a young man he dreamed of acquiring the power to "rise up off the ground, like Jesus Christ." While such
a belief may have aboriginal correlates, there are no Klamath today who would
accept it as valid. Sparrow keeps this secret to himself, and relates it only
to strangers and transients from whom he intends to borrow money. His other
skills include the following: the ability to keep house and cook, harness making,
leather working, painting, canning food (the notion involves laying in stores
for the winter), tanning buckskin, wood carving, carpentry, poetry composition
(in Klamath), arrowhead making, making traditional basketry, stock raising,
restaurant management, and finally, the ability to bewitch rich old white ladies,
who are captivated by him and who drive him about in their white Cadillacs. The
latter may be associated with a recurrent dream of meeting with a white buffalo,
also a symbol of power, but it is difficult to say, for there were never any
buffalo near the Klamath, and it is more likely that he has got this idea from
reading western stories. Needless to say, most of these skills are quite delusional also. There is no evidence for any of them being more than this. Relating one or more of these is Sparrow's single style of interacting with others,
for in reaction to a question or another's anecdote he will sift about in his
memory until he comes up with one of his capacities which seems relevant. Very
frequently, the writer could not see where or how they were appropriate, but for
Sparrow there seemed to be some connection. He relates these matter of factly,
with only the most slight suggestion that they were self-enhancing, and no indication that he meant to justify himself, and will then coyly watch his listener
to see if he is properly impressed. This behavior tends to merge with Sparrow's

Nell: Female, Age 33

Background Data

In contrast to Sparrow, much of Nell's behavior is disparaged and negatively [159*]
sanctioned by the community, while she too must be located at the lower end of [156]
the status hierarchy. Nell got her first job when she was 18, and for the [464]
last five years she has been working steadily as a clerk in the Agency. She
is a high school graduate and has 2½ years of business school training. Except [874]
for being away at school and a short period of residence with one of her hus-
bands in Oklahoma, she has lived all of her life on the reservation.

Nell was raised by her own parents on their ranch and is the second eldest of
nine children. Her earliest memories are of being fearful of domestic animals
and of preferring to be by herself, playing with her dolls. She seldom played
with her siblings or with other children, and her interest in dolls and making
and dressing paper dolls continued through her first marriage in her early
twenties. She felt that her mother always blamed her or the other girls for
everything, while her father favored his daughters. All of the children were [871]
sent away to boarding school, and most of their childhood was spent away from
home. By the age of 12, when home, Nell was busy with housework, cooking, baking, [857]
and caring for her younger siblings. In this large nuclear family there was an
extensive division of labor, with each assigned his or her specific tasks. Her [593]
parents never left their children with "sitters" or relatives. Their "caretaking"
activities are, perhaps, among the most consistent and extensive in the area,
with the exception of the boarding school. Nell received little direct instruc- [368]
tion from her mother, and her closest adult woman companion was her grandmother.
Nell knows none of the Klamath language. Both her mother and her father were [191]
disturbed because Nell always wanted to be off by herself. When she was in
boarding school her parents visited her once or twice yearly, but they never wrote
her. Nell preferred her father, and when she grew up she felt that her mother
was not the kind of person she had thought she was. Nell feels that this may be
due to her own behavior. She received no direct sex training, and was 18 before [864]
she discovered the significance of her menses. Her first sexual experience was
at 8, when she was molested by a cousin.

Nell has always preferred to play with boys rather than with girls. Today she [626]
is socially isolated at her office, where none of the other women speak to her. [156]
She is equally isolated from her family, who rejected her and threw her out of
their house when she was 20, at which time she was pregnant by her first husband,
who had deserted her when he discovered her pregnancy. She has been married and [586]
divorced three times and has maintained a regular liaison with at least five
other men. She will go directly from one such liaison to another, with never [156]
more than a few days between men, and on several occasions some overlap. Occa-
sionally one of her ex-husbands or ex-lovers returns to live with her and attempts [588]
to take up with her again. She has borne eight children, has had two miscarriages,
and at least one abortion. She cannot tolerate not having a man in the house
(it is her house maintained at her expense). Several of her children are tech-
nically illegitimate and the paternity of at least one is in doubt. It is this [59*]
sexual laxity which particularly brings down the ire of the community upon her. [56]

Nell thinks of herself as an unfriendly person who would rather be left alone,
particularly by other women. She always waits until someone else makes the first
advance. It was therefore surprising to have her show up one day and request [124]
testing and advice. She was in trouble and she was convinced something was
wrong with her. The "presenting problem" was an unbearable load of shame, guilt,

Grandma Williams: Female, Age 67

*159
Background Data

156 Understandably, it is difficult to find a match for a person like Weasel, particularly
in the instance of a woman who occupies a similar status. The few
[595] Klamath women who were like Weasel were not available for testing. Grandma
William's position is that of the mother of a large, disorganized nuclear family
[733] like Weasel's, one marked by excessive drinking, violence, and promiscuity.
[83] She is a vigorous, hearty, earthy old woman who has borne eight children by
three husbands. She is once divorced and twice widowed, her first husband
[587] having died after three years of marriage, her third after thirty-five. She
[871] completed six years of school, all that was available when she was a girl, and
she has lived and visited for extended periods in Washington state, Missouri,
[178] California, and Mexico.

[657] Grandma William's mother was a traditional Klamath wife and mother, and her father
for years an Agency Indian policeman. In her words, both her family of orientation
[464] and her family of procreation have had "bad luck." This bad luck consists of numerous
bouts with the law over acts of violence. Her father died in the Federal
penitentiary where he was serving a life sentence for murder. Several of her
sons have killed men in the past. One is reputed to have killed at least five,
and he is now in a State institution. Her other children are noted for their
violence, and local informants say of Grandma that they cannot understand how
such "a wonderful, good old lady managed to produce so many worthless children."
[577] Few feel that she deserves such a fate. Community acceptance of Grandma Williams
is based upon several attributes, her steady, hard work, her commitment to raising
[177] a family, her devoutly Christian behavior, her espousal of dominant White values,
and, especially, her hearty good humor. She has never accepted the guilt of
either her father or her sons, maintains that they were falsely accused, and
has worked steadily to secure her one son's pardon.

[191] Grandma Williams was raised in a Klamath speaking household and acquired her
English in school. She is very proud of her education and maintains that children
[871] today are not so well tutored in the 3 Rs as she was. She claims that "I
can just about out-spell, out-write, and out-figure all of my kids." This is by
[593] no means the only aggressive, competitive attitude she maintains towards her
children, none of whom have ever quite lived up to her standards. In this respect,
[603] Clifton was once able to witness her training a grandson, who was an alert,
[867] spontaneous, active lad. The boy was made to be too polite and too formal, behaviors
in keeping perhaps with urban middle-class society, but very much out of
place on the reservation. All of her sons have maintained their main affiliations
with the local "cowboy" culture, but they are ridiculed for their efforts at
riding and calf roping because of their obesity and clumsyness, none of them
coming near, in physical type, to the slim hipped, pencil shaped cowboy ideal.
[657] She is an excellent example of a woman who, early in the reservation period, was
carefully tutored by conscientious minister-teachers in inappropriate behaviors
[871] and values, and who has attempted to transmit these to her children. It would
[177] seem that she has produced over-trained, and mis-trained, hostile children, who
promptly discovered that regardless of their veneer of "culture" they were rejected
from many local circles because of their Indianness.

*159 Grandma is a direct, forceful person, another Klamath woman with a sharp wit
157 (yet a less personal one than Aunt May's). She is quick to initiate interchanges
and to attempt to knit together a strained situation. Yet her responses
156

11✓ stage before the publication of the present volume. Even the author experienced considerable difficulties before he could pass beyond that limit. [191] When he reached the reservation agency he found not over three or four individuals who were able to speak a tolerable English, and the knowledge of this tongue is absolutely necessary to any one who aspires to the position of an interpreter of his own language in those parts. The Indians were nearly all pure bloods, and most of them knew scarcely more than a dozen English terms. Many could converse in Chinook jargon, but the majority, especially the females, were not acquainted even with this precarious means of intercourse. Indeed, these people must be slow in acquiring an Aryan language like English, for it presents so many character- [193] istics entirely opposite to those of Klamath. English is not provided with reduplication, prefixes of form, nor with the multiple suffixes of Klamath; it differs from it also by its more complex syntactic structure, its imperfect nominal inflection, by its distinctive form for the nominal plural, the gradation of the adjective and adverb effected by suffixation, its personal inflection of the verb, and a long array of irregular and auxiliary verbs.

12✓ Thus it will be easily perceived that the obtaining of correct and reliable ethnographic and linguistic information in such a tribe is fraught with many difficulties. Sometimes it is practicable to get the terms for visible objects by making gesture signs or by pointing at the objects, but it just as often misleads; and if the investigator has to do with people who know no other language than their own, he must revise his notes with many of them before he can place any trust in what he has written down from dictation. [191] The Indians and mixed bloods who have made some progress in the acquisition of English pronounce *f* as *p*, *v* as *b*, *r* as *l*—are modeling English after their own language, using *he* for our *he, she, it, they, him, her, them;* all this being hû'k, hû't, hû'nk for them. They do not know how to use our conjunctions, a defect which makes all the tales, myths, and other textual information unintelligible. The only means of obtaining results is to pick out the best people from the crowd and to train them for awhile for the purpose wanted, until they are brought so far as to feel or understand the scope of the investigator. Women will be found more useful than men to inform him about myths, animal stories, the gathering of vegetable food, house-

538 and locutions, repeated from generation to generation, are not always understood
[173] at the present day by the young people, who most attentively listen to
the aged rhapsodists, when they expound these miraculous stories in the lurid
glare of the nocturnal campfire. Nothing in them indicates a migration of
these upland tribes from any part of the country into their present homes,
and hence the Máklaks must have had undisturbed possession of the headwaters
of Klamath River for some centuries prior to the advent of the
white population.

197 The various texts obtained clearly exhibit the character of the language
538 actually spoken and the difference existing between the two dialects,
124 but they do not all possess the same linguistic value. The texts of
Dave Hill and others are worded in the conversational language of the
tribe, which in many particulars differs from the more elaborate and circumstantial
mode of speech which appears in the mythic tales given by
124 Minnie Froben. The "Modoc War" and some of the shorter pieces could be
126 obtained only by putting down the English first and then getting sentence
for sentence in the dialect, whereas the best worded stories and specimens
were written in continuous dictation. All texts obtained were carefully
revised first with the informants, then with other natives, and all the necessary
explanations added at the time.

533 From a purely linguistic view the popular songs or song-lines are the
most valuable contributions. The melodies of some of their number deserve
to be called pretty, according to our musical taste. To the natives all of
them appear harmonious; but when the Western Indian calls some melody
"pretty," guided by his musical principles, he very frequently does so in
opposition to what our ear tells us to call by this predicate.

124 The Klamath Lake dialect was spoken by the majority of the contributors
191 to my linguistic anthology. I obtained these specimens, with the
exclusion of the Modoc texts, in the autumn of 1877, at the Klamath
Reservation, Lake County, Oregon. Though many of these natives speak
the Chinook jargon more fluently than English, I never availed myself, for
obtaining any information whatever, of that imperfect and hybrid medium,
through which the Indians of the Northwest carry on so much of their
intercourse.

795
771 reservation residents are not attracted. Like its more dramatic predecessors,
178 the Shaker religion fails as a bulwark against societal disorganization.

[182] The modern Klamath are in the main nominally Christian. Many are
allied with local churches: Protestant groups attract a fair following; some
771 are Roman Catholics; others now and again join the itinerant Pentecostal
795 and Holiness groups. While many Klamath are unquestionably religious in
184 the accepted Christian sense, the church offers a primary social outlet to
[797] those who value group association. Whatever the function of the church on
the reservation today, apparently it has no aboriginal vestiges in its ritual
[571] or organization. It would be impossible to say to what extent tribal members
find a link with the native past in the spiritual curing practices of such bodies
as the Pentecostal Assemblies of God, which, however, clearly make no concessions
to aboriginal concepts.

771 It thus seems evident that the overt forms of tribal religion are gone. The
177 Klamath majority is now avowedly Christian even though church affiliation
is not universal. Religious attitudes seem highly diverse. Some individuals,
184 while indifferent to religious tenet, are admittedly attracted by the display
or by social opportunities. Some are devout, others ignore the churches entirely.
Still others, whether or not church members, speculate on religious
questions, show considerable introspective preoccupation, or are frankly
curious about native religion and Christianity. Their opinions and attitudes
[755] demonstrate that the aboriginal past is not wholly dead. In this consideration,
[757] shamanistic curing may be ruled out, since modern medicine is generally
accepted by the Klamath and, in any case, shamanistic patterns have merged
with the decaying Shaker Cult. Since this is so, the less formalized aspects
of the aboriginal religion survive to intrude now and again into modern conceptualization.

183 The survival of cosmological features may still be observed here and there.
[773] For example, tales of people and animals turned to stone by Crow's laughter
are half-credulously recounted by young and old. A surviving custom or two,
183 reflecting the older world-view, might also be noted. A boy who kills his first
224 deer is well advised not to eat its meat himself. By giving the game away,
he averts failure in his next hunting expedition. Hunting on the reservation
today is a sport, no economic value being attached to it. (Aboriginally too,
the Klamath were so well adapted to their specialized lake-marsh economy
that hunting played a distinctly minor part.) This custom, which may stem
from the emphasis on wealth and generosity, is laughed down today but it is
825 still practised. Another very common belief is that animals can speak Klamath
[197] but not English. A howling coyote is recognized by young and old as a harbinger
[763] of death; the owl says, "'Maklaks, 'maklaks," which "when you hear
it, it means somebody close to you is going to die." The Klamath word means
183 human and refers to the tribe itself. Taboos on the first game of the hunter,
the first wild foods gathered, as well as fear of the owl are widely distributed
among western tribes.

178 But more pertinent here are the modern Klamath views based on the past
which either influence actual behavior or bridge a gap, conceptually, specu-

000 that woman; he acts just like a boss toward her."

3975. WT: Also, in Upper Trinity subarea of Wintu, informant had heard of 1 instance of mother-in-law killing daughter-in-law after husband died. "The mother-in-law didn't want that woman to take another husband, so she killed her with a bone needle [dagger?]. She was sorry after she did it; but she didn't like the woman having another husband who would look just like her son; it would make her [mother-in-law] feel badly."

[587] 3976. In case there is no brother-in-law to ask.

3977. If there is no brother-in-law to receive the payment. AW: Sister-in-law may dispose of widow to more-distant male relative of dead husband also.

3980. SW: A divorce "puts a man and woman clear away from each other"; no payment rendered former husband.

562 587 593 3981. Kl: If man does not like his wife for some reason, he announces, "Anyone who wants my wife can take her, if they give me something. If you people don't want her, I'll kill her." The men discuss it; husband repeats the announcement, sets date when he will kill woman; some man finally takes her for wife, gives the husband something; "that's how they save a woman, sometimes." No one knows what trouble between husband and wife prompts man to do this, and man never tells; he doesn't beat his wife, he just sells her. Only done occasionally; when informant was boy such sales still taking place; informant had seen one couple separated this way. Woman not captive.

000 Intercourse; promiscuity.--

3984. NF: Girl cries, fights husband, so girl's mother sleeps beside girl first night latter sleeps with husband.

3985. NF: Do not allow people to sleep lying on back "like dead people"; lie on side and "put their heart in hiding" so no evil will befall sleepers.

[152] [192] 3987. Purse lips and make sound, "čk, čk," repeatedly, close to baby's face. AW: Rub hands over baby's face or neck while making sound; same done between adults. AE: "Learned to make this sound from animals--badger, raccoon."

3988. SE: No virginity tests, but observe boy's actions around girls. AE: If girl's, boy's legs get "heavy" (tired) during girl's puberty dance, sign he or she is not virgin. Spectators watch to see whether this happens. WT: Can tell whether girl is virgin or not by shape of her abdomen, if firm, smooth, judge she is.

[548] [178] 3989. Kl: Prostitution with payment recent custom only.

3990. WM: Especially at girl's puberty dance.

836 3991. Kl: Said to have been extremely rare; "girls never ran around; pretty hard to get a woman." Girl's parents wanted girl to marry man who could get her lots of fish, so she would eat

[228-A]

137 to produce them. This is true to a certain extent; but as there are so many
278 plants growing there that narcotize the fish, how is it that the country produces no medical plants for the cure of men's diseases? Of the plant shlē'dsh, at least, they prepare a drink as a sort of tea.

136 The fauna of the Klamath uplands appears to be richer in species than
192 the vegetal growth. What first strikes the traveler's attention on the eastern shore of the Upper Lake is the prodigious number of burrows along the sandy road, especially in the timber, varying in size from a few inches to a foot in diameter. They are made by chipmunks of two species, and others are the dens of badgers, or of the blue and the more common brown squirrel. The coyote or prairie-wolf makes burrows also, but this animal has lately become scarce. No game is so frequent as the deer. This is either the black-tail deer, (shuá-i, *Cervus columbianus*), or the white tail deer (múshmush, *Cariacus virginianus macrurus*), or the mule-deer (pak̲ólesh, *Cervus macrotis*). Less frequent is the antelope (tché-u, *Antilocapra americana*), and most other four-legged game must be sought for now upon distant heights or in the deeper cañons, as the elk (vún), the bear in his three varieties (black, cinnamon, and grizzly; witä'm, náka, lû'k̲), the lynx (shlóa), the gray wolf (kä'-utchish), the silver or red fox (wán), the little gray fox (k̲étchk̲atch), the cougar (táslatch), and the mountain sheep (k̲ó-il). Beavers, otters, minks, and woodchucks are trapped by expert Indians on the rivers, ponds, and brooklets of the interior.

The shores of the water-basins are enlivened by innumerable swarms of water-fowls, (mä'mäkli), as ducks, geese, herons, and cranes. Some can be seen day by day swimming about gracefully or fishing at Modoc Point (Nílakshi) and other promontories, while others venture up the river courses and fly over swampy tracts extending far inland. Among the ducks the more common are the mallard (wē'ks), the long-necked kílidshiks; among the geese, the brant (lálak) and the white goose (waíwash). Other water-birds are the white swan (kúsh), the coot or mudhen (túhush), the loon (táplal), the pelican (yámal or kúmal), and the pinguin (kuítsia). Fish-hawks and bald-headed eagles (yaúχal) are circling about in the air to catch the fish which are approaching the water's surface unaware of danger. Marsh-hawks and other raptores infest the marshes and are lurking there

136 for small game, as field-mice, or for sedge-hens and smaller birds. The 192 largest bird of the country, the golden eagle, or Californian condor (p'laíwash), has become scarce. Blackbirds exist in large numbers, and are very destructive to the crops throughout Oregon. Other birds existing in several species are the owl, lark, woodpecker, and the pigeon. Migratory birds, as the humming-birds and mocking-birds, visit the Klamath uplands, especially the Lost River Valley, and stop there till winter.

The species of fish found in the country are the mountain trout, the salmon, and several species of suckers. Of the snake family the more frequent species are the garter-snake (wíshink), the black-snake (wámĕnigsh), and the rattlesnake (k̲é-ish, k̲í'sh). Crickets and grasshoppers are roasted and eaten by the Indians, also the chrysalis of a moth (púlχuantch).

THE ASPECTS OF THE COUNTRY.

> Elle est riante ainsi que l'Italie,
> Terrible ainsi que les rives du Nord.

133 The Klamath plateau presents very different aspects and produces very different impressions, according to the observer's condition and the character of the localities he enters or beholds. Travelers coming over the monotonous rocky or alkaline plains extending between Malheur Lake and the Reservation are gladdened at the sight of rivulets and springs, imparting a fresher verdure to the unproductive soil, and greet with welcome the pineries which they behold at a distance. Feelings of the same kind penetrate the hearts of those who enter the highlands from the Pit River country of California when they come to the well-watered plains of Lost River after crossing the desolate lava formations lying between. The scenery can be called *grand* only there, where the towering ridge of the Cascade Mountains and the shining mirrors of the lakes at their feet confront the visitor, surprised to see in both a reproduction of Alpine landscapes in the extreme West of America.* The alternation of jagged and angular outlines with long level ridges on the horizon suggests, and the peculiar lava color retained by

---

* The large pyramidal cone of Mount Pitt is a rather accurate duplicate of the celebrated Niesen Peak in the Bernese Oberland, Switzerland, as seen from its northern and eastern side.

773 As a result of their seclusion, all their geogonic and creation myths are
776 acting around the headwaters of Klamath River and in Lost River Valley, and the first man is said to have been created by their national deity, K'mukámtchiksh, at the base of the lofty Cascade Range, upon the prairie drained by Wood River. I have obtained no myth disclosing any knowledge of the ocean, which is scarcely one hundred and fifty miles distant in an air line from their seats. They have no flood or inundation myths that
192 are not imported from abroad; and what is of special importance here, their terms for *salt* (ā'dak, shō'lt) are *not their own*, but are derived from foreign languages.

173 There is an animal story embodied in the Texts, page 131, forming
773 No. II of the "Spell of the Laughing Raven," containing the sentence: "Hereupon the Klamath Lake people began fighting the Northerners." I believed at first that this contained a historic reminiscence of some intertribal war, but now am rather doubtful about it. The song 192; 1 was supposed by some Indians to be a very old reminiscence, while others referred it to the presence of the Warm Spring scouts in the Modoc war.

I conclude from the foregoing facts that historic traditions do not exist among these mountaineer Indians. If there are any, I was unable to obtain
000 them. The racial qualities of the Modocs, and still more those of the É-ukshikni, indicate a closer resemblance with Oregonians and Columbia River tribes than with Shoshonians and Californians.

B. ARCHÆOLOGIC REMAINS.

211 The Klamath people have not evinced any more propensity for erecting monuments of any kind than they have for perpetuating the memory
346 of their ancestors in song or tradition. In fact, structures the probable
226 age of which exceeds one hundred years are very few. Among these may be particularized the three ceremonial sweat-lodges and perhaps some of the river-barrages, intended to facilitate the catch of fish, if they should turn out to be of artificial and not of natural origin. In the Lost River
172 Valley is a well, claimed by Modocs to be Aishish's gift—probably one of
312 the large natural springs or wélwash which are seen bubbling up in so many places upon the reservation. Stephen Powers reports that near the

193 Wintún dialects, süχ in Yuki, sit, si-it in Mutsun (coast dialects), sa in
197 Santa Barbara, tcháwa in some dialects of Maidu. It is justifiable to regard Kl. shúm as an ancient *possessive case* of the sí, sa *tooth* of Central Californian languages; cf. what is said concerning the suffix -im.

tút *tooth* appears related to tuχt *tooth* of Sayusla, a dialect of Yakwina and also to tit of the Sahaptin dialects; ititi "his tooth" in Walawála.

tchi-, *tsi-* is a radical often used on the Pacific coast referring to water or liquids, their motions, and the acts performed with or within the watery element. While in Klamath it figures as a prefix only, q. v., other tongues make use of it as a radical. Tchí is *water* in Yákwina, in Takílma, and in the Yuchi of the Savannah River; in Zuñi 'tcháwe is *water* ('t alveolar) in Nója tchúdshe. The Sahaptin dialects show it in Warm Spring tchū'sh *water*, atá-tchash *ocean;* in Klikatat tcháwas *water*, atá-tchis *ocean*, tcháwat *to drink;* while in Nez-Percé tchū'sh changes to kúsh. Chinook has 'ltchúkwa *water*, Ch. J. salt-tchuk *ocean*, but the Selish languages employ a radix se-u'l, si-u'l, shá-u instead to designate any liquid.

wá *to exist, live, to be within*, and *to grow* or *generate* is a radix to be traced in many of the Western tongues. In Klamath we refer to wá and its numerous derivatives, as wawápka *to sit* or *be on the ground*, wá-ish *productive*, wá-ishi, wéwanuish, wē'k *arm* and *limb of tree*, lit. "what is growing upon," wē'ka *offspring*, wékala, wásh *hole to live in*, wā'shla (a) *to dig a burrow*, (b) *ground-squirrel*, and many others. In Kwákiutl wāts, wátsa is *dog*, but originally "living being, animal," and is represented in Klamath by wāsh *prairie-wolf*, wátch *horse*, watchága *dog*, lit. "little animal," the idea of "domesticated" or "belonging to man" to be supplied. In Chinook the suffix -uks (for -waks) points to living beings also. The Sahaptin languages show this root in wásh *to be, exist*, in Nez Percé wáχosh *alive*, wátash *place, field, earth*, in Yákima wakχash *living*, and in other terms.

AFFINITIES IN WESTERN LANGUAGES.

192 Many of the Western families exhibit but little or no affinity in their
197 lexicon with the Klamath language, the reason being undoubtedly that they are but little explored. Thus in *Mutsun* a single term only was found to correspond: tcháya *shallow basket* in the dialect of Soledad; *cf.* tchála and

192 tchákéla, by which two kinds of root baskets are specified in Klamath. 197 The Sayúsla tséokwa *leg* answers to tchū'ks, Mod. tchókash *leg* and to shō'ksh, Mod. tchē-ō'ksh *crane*, this bird being called after its long legs. The *Shoshoni* stock, with its extensive array of dialects, spoken in the closest vicinity of the Klamath people, is almost devoid of any resemblances; cf. k̲á-i *not*, and nápal *egg*, compared with nobáve in Payute, nobávh Chemehuevi, nópavh Shoshoni. This probably rests on no real affinity. In the *Noja* language, spoken near Redding, California, putsi *humming-bird* corresponds to Kl. pí'shash, and tcháshina, tcháshi, a small *skunk* species, to Kl. tcháshish. For *Wintún* may be compared Kl. pán *to eat* with ba, bah; k̲álo *sky* (from k̲álk̲ali, round, globiform) with k'áltse *sky*.

From *Selish* saíga' *field* the Kl. saíga, saíka *prairie, field, meadow* was certainly borrowed, and t'táze *grasshopper* of Kalispelm reappears here in ta'htá-ash and in Mod. kamtáta. Kaúkawak *yellow* of *Chinook* is kauká-uli, kevkévli *brown* of Kl.; and ténas *young, recent* reappears in Kl. té-ini *new, young*, te-iniwá-ash *young woman;* cf. ténāse *infant* in Aht dialect of Vancouver Island. The long array of words which Klamath has borrowed from Chinook jargon are enumerated in Grammar, pages 220–222.

Maídu.—An uncommon number of affinities are found to exist between Klamath and the Maídu dialects east of the Sacramento River. Of these terms some are not loan words, but appear to be derived from some common stock.

halá *slope of mountain;* Kl. lála, hlála *to slope downwards.*

kála *hot-water basket;* Maídu, k̲óllo *cup-basket.*

káwe *eel;* Maídu, kowó.

ngúlu, k̲úlu, k̲úlo *female animal;* Maídu dialects: kü'le, kü'lle, kúla, *woman, wife*, and *female animal.* This word also composes the terms *father* and *child*, and hence means "to generate"

pán *to eat:* Maídu, d. pen, pap, pā, pepe *to eat;* pán *to smoke* in Maídu, corresponds to Kl. páka; páni, pan is *tobacco* in Maídu.

pēn, pä'n *again, a second time;* Maídu, pēne *two.*

vúlal, úlal *cottonwood tree;* Maídu, wílili.

From the *Shasti* language Modoc has borrowed more than Klamath Lake, and the terms as far as known are all mentioned in the Dictionary.

192 They are ípō, ipshúna, etchmū'nna, ā'dak, hápush (cf. also hápa *kangaroo*
197 *rat* and *striped squirrel* in Noja) and probably also kála *hot-water basket*, mádna *sunflower*.

Its southeastern or *Pit River* dialect shows a number of terms probably not loaned, but resting upon some indefinite common affinity. Thus édshash *milk, breast, udder* is in Pit River ídshit *female breast* (cf. Ara: útchis *milk*), wán *silver fox*, dim. wánaga, in Pit River kwán *silver fox* and wan- in wanekpúsha *fox;* käíla *earth* is in Pit River kéla, taktákli *red* is taχtáχe, tídshi *good* is túsai, túshi, kō'sh *pine tree* is kashú.

The only families in which a considerable number of terms possibly rests upon a real and not fancied kinship are those of Wayiletpu and Sahaptin.

WAYÍLETPU DIALECTS.

Wayiletpu, of which two dialects only are known or accessible to us, Kayuse and Molale, shows the following affinities:

Kl. gí *to be, to exist*, Molale, gísht *he is*, gíshlai *he will be.* Compare to this in Maídu: bishi *alive* and *dwelling place;* Wintún: bim *to be* (present tense).

Kl. kē, kēk *this;* Kayuse, ka, kē, ke, kai *this, this one.*

Kl. gu, kū, kunē *that;* Kayuse, ku, kâ, kŭ yúwant *that man*, káppik *they.*

Kl. ína, d. yána *downward*, yaína *mountain;* Molale, yángint *elevation.*

Kl. lák *forehead;* Molale, lakunui *face.*

Kl. lā'pi, lāp *two;* Molale, lápka *two*, lápitka *seven;* Kayuse, lipúyi, líplint *two;* líplil *twins.*

Kl. lúkua *to be hot, warm*, lókuash *warm, hot*, and *heat*, lúluks *fire;* Kayuse lokoyai *warm, hot.*

Kl. mukmúkli *cinnamon-complexioned* (originally "downy"), tch'múka *to be dark* (as night); Molale, móka *dark*, mukimuki *dark complexioned;* múkimuk'-waí "black man," *negro.*

Kl. mpáto, páto *cheek*, cf. patpátli; Molale, páktit *cheek.*

Kl. nā'dsh *one;* Kayuse, na *one;* Molale, nánga *one*, composes nápitka *six.*

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

192 Kl. nánuk *all*, nánka *some, a part of;* Kayuse, náng, nanginâ-a *all;*
197 Molale, nángkai *all.*

Kl. nápal *egg;* Kayuse, lúpil, laupen *egg.*

Kl. pán *to eat;* Kayuse, pitánga; Molale, pá-ast to eat.

Kl. páwatch *tongue;* Kayuse, púsh; Molale, apá-us.

Kl. pä'χtgi *to dawn, the dawn;* Molale, pákast *morning.*

Kl. píla *on one's body, on the bare skin;* Kayuse, pí'li *meat;* Molale pí'l *body.*

Kl. shuaí *black-tailed deer;* Molale, suaí *deer* and *white-tailed deer.*

Kl. túmi *many, much;* Molale, tám *many.*

Kl. waíta *to pass a day and night*, or *a day*, waítash *day;* Kayuse, ewé-iu or uwâya, wéya *day*, u-áwish, huéwish ~~*sun;*~~ Molale, wásh *day* and *sun*, wásam *summer-time.*

Kl. wáko *white pine;* Molale, wákant, wákint, wákunt *log.*

Kl. wēk *limb of tree;* Kayuse, pasiwä'ku *limb of tree.*

Kl. wekétash *green frog;* Molale, wákatinsh *frog.*

In the morphologic part we also detect a number of close analogies between the two families:

hash-, hish-, is a prefix forming a sort of causative verbs by anathesis in Molale, like h-sh of Klamath; e. g., íshi *he said*, hisháshi *he replied.*

-gála, -kála, a Molale case-suffix *to, toward*, corresponds to -tála *toward* of Klamath.

-im, -am forms the possessive case in Wayfleptu; am in Klamath.

p- is prefix in terms of relationship in both families, and -p also occurs as suffix in these and other terms; cf. Sahaptin.

Distributive forms are made by syllabic reduplication in Kayuse exactly in the same manner as in Klamath: yámua *great*, d. yiyímu; laháyis *old*, d. lalháyis; luástu *bad*, d. laluástu; suáyu *good*, d. sasuáyu.

SAHAPTIN DIALECTS.

The *Sahaptin* dialects coincide with Klamath just as strikingly in some of the words and grammatic forms as do those of Wayíletpu, and it is singular that in a number of these *all three* mutually agree, as in lúkua, mukmúkli, and two numerals.

192
197

Kl. ka-uká-uli, kevkévli, ke-uké-uli *brown;* Nez-Percé, ka-uχká-uχ *drab, light yellow, dark cream.*

Kl ke, kēk *this;* Nez-Percé, ki, pl. kima *this;* adv. kina *here,* kimtam *near.*

Kl. kitchkáni *little,* adv. kítcha, kétcha; kuskus, Nez Percé, *small, little;* ikkes, Yákima; kískis, Warm Spring.

Kl. ktá-i *rock, stone;* ktä't *hard,* Yakima.

Kl. lā'pi, lāp *two;* lápit, lépīt *two,* Nez Percé; napit, Walawála; nä'pt, Warm Spring.

Kl. lúkua *to be warm, hot,* lókuash and lushlúshli *warm;* lúluks *fire;* luóχuts *warm,* Nez Percé; ilúksha *fire* in Nez Percé and Walawala; ílksh, Warm Spring; elusha *to burn,* lókautch *cinders,* Yakima; láχuiχ, láhoiχ *warm,* Yakima; láχwai, Warm Spring.

Kl. mukmúkli, makmákli *cinnamon-colored;* máχsmaχs, Nez Percé, *yellow;* máχsh, Yakima and Warm Spring (also as múksh *blonde, auburn,* Warm Spring).

Kl. mû'lk *worm, maggot,* mānk, *fly;* muχlimuχlí *fly,* Warm Spring.

Kl. múshmush *cattle, cow,* originally meant "lowing like cattle," from the Sahaptin mú *cattle;* cf. Texts, Note to 13, 13.

Kl. nā'dsh *one;* nā'χs, lā'χs, Yakima; nä'χsh, Warm Spring.

Kl. nánka *some, a portion of;* nánka *some* in several Sahaptin dialects.

Kl. páwatch *tongue;* páwish, Nez Percé.

Kl. pé-ip *daughter;* pap, Nez Percé, Warm Spring, *daughter* (not one's own).

Kl. pí *he, she,* p'na, m'na *him, her;* pína *self, oneself, himself,* etc., Nez Percé; píni *he, this one,* Warm Spring.

Kl. taktákli *level, even, flat;* tíkai *flat,* Yakima; cf. tä-i'h *bottom land.*

Kl. tatáksni *children;* (na)títait *man,* Yakima; titókan *people,* Nez Percé.

Kl. tchĕmúka, tsmúka *to be dark,* cf. mukmúkli; tsĕmúχtsĕmuχ *dark brown* (prieto), *of dark complexion, black,* Nez Percé; shmúk, Yakima; tchmū'k, Warm Spring, *dark;* shmukakúsha *to blacken,* Yakima.

Kl. vû'nsh, u-únsh *boat, canoe, dug-out;* wássas *boat,* Yakima, Warm Spring.

192 197 Of agreements in the morphologic part of grammar we notice considerable analogy in the inflection of the Sahaptin substantive with its numerous case forms:

Reduplication for inflectional purposes is syllabic also, but not so generally in use as in Klamath; Nez Percé táyits *good*, abbr. ta'hs; plur. tita'hs.

Kl. -kni, ending of adj. "coming from;" -pkinih, subst. case, *from;* init *house*, initpkinih *from a house*, in Nez Percé.

p- prefix forms most names of relationship: píka *mother*, píap *elder brother*, pet *sister;* -p as suffix appears in Nez Percé asχap *younger brother*, asip *sister* (ísip Walawala). The prefix pi- forms reciprocal verbs; hak-, hah-, radix of verb *to see*, forms pihaksih *to see each other*.

Kl. -na is transitional case-suffix; cf. Nez Percé kína *here*, from pron. ki *this*.

CONCLUSIONS.

197 The conclusions which can be drawn with some degree of safety from the above linguistic data and some mythologic facts, concerning the prehistoric condition of the people which occupies our attention, are not unimportant, and may be expressed as follows:

Although it is often a difficult matter to distinguish the loan words in the above lists from the words resting upon ancient affinity, the table shows that the real loan-words of the Máklaks were borrowed from vicinal tribes only, as the Shasti, and that those which they hold in common with other tribes more probably rest on a stock of words common to both, as the pronominal roots. The affinity with Maidu appears more considerable than that with other Californian tribes only because the Maidu dialects have been studied more thoroughly. Scarcely any affinity is traceable with the coast dialects of Oregon and California, and none with the Tinné dialects, though the Umpkwa and Rogue River Indians lived in settlements almost conterminous with those of the Máklaks. The latter were acquainted with the Pacific Ocean only by hearsay, for they have no original word for *salt* or *tide*, nor for any of the larger salt-water fish or mammals, and their term for sea is a *compound* and not a simple word: múni é-ush "great water-sheet," just as the Peruvians of the mountains call the ocean "mother-lake," mamacocha. The scanty knowledge of the sea, which was scarcely one hundred

THE ELEMENTARY DEITIES.

771 In the Klamath theology the deities of the elements have preserved almost intact their character as representatives of the powers of nature. Imperfectly anthropomorphized as they are, they appear rather as spirits than as gods; all of them, the Earth perhaps excepted, are of the male sex. [193] Like the animal genii they assume the adjectival suffix -ámtchiksh, abbr. -amtch *bygone, ancient, belonging to the past,*[*] though less among the Modocs than in the northern chieftaincy. The splendor, power, and awe-inspiring qualities of these superhuman beings is not diminished in the least by the grotesque exterior and acts ascribed to some of them. The sky gods were more plastically defined by popular imagination than the subterranean deities, and hence we begin our sketch with the former.

K'MÚKAMTCH.

> Ille mihi par esse deo videtur,
> Ille, si fas est, superare divos.

The chief deity of the Klamath people, the creator of the world and of mankind, is K'múkamtch, or the "Old Man of the Ancients," the "Primeval Old Man." [192] The full form of the name is K'muk'-ámtchiksh, and Modocs frequently use the shorter form Kĕmúsh, K'músh, an abbreviation of k'mútcha, *he has grown old, he is old,* or of its participle k'mutchátko, *old.* He is also named P'tísh-amtch nálam, *our old father.* He was also designated P'laitálkni, *the one on high,* though the term is now used for the God of the Christians. In every way he is analogous to the "old man above" or the "chief in the skies" of the Indians of Central California.

773 What the Indians say and think of their chief deity I have outlined 776 in the Dictionary, pages 138–140, and what follows here will substantiate 772 the data given there. Though K'múkamtch is reputed to have created the earth, what is really meant is only the small portion of the globe known to and inhabited by this mountaineer tribe, and not the immense terrestrial globe, with its seas and continents. Neither have these Indians an idea of what the universe really is when they call him the creator and

---

[*] In Nahuatl we may compare the reverential suffix -tzin, and in Shoshoni dialects the parallel one of -pitch, -bits; e. g., múbu *owl* in Bannock is mû'mbits *owl* in the Shoshoni of Idaho.

773 maintainer of the universe. The Indians do not claim that he created
776 the world with all in it by one single and simultaneous act, but when he is
772 creating, metamorphosing, or destroying, his acts are always special, directed
[823] towards certain objects only. After making the earth, the lakes, islands, prairies, and mountains he gave a name to each locality (p. 142, 1 sqq.). Some of these names must be regarded as giving indications as to the earliest places inhabited by these Indians, especially when they designate fish-traps and ceremonial sudatories. Thus on Upper Klamath Lake we find Kû'mbat, Túkwa, Tulísh, Kohásbti as fishing places, Ktá-i-Tupáksi and Yulalóna as fish-traps, the special gifts of the deity to the people. Other places of this kind are Shuyakē'kish and Ktá-i-Tupáksi. In the old Modoc country, on Lower Klamath Lake, there is a rock shaped like a crescent and called Shapashχē'ni, because "sun and moon once lived there." On Sprague River there is a hill called "at K'múkamtch's Lodge"—K'mútcham Látsaashkshi. Other legendary residences of the deity were at Yámsi, "Northwind's residence," a high mountain east of Klamath Marsh; others on Tule Lake, at Nílakshi Mountain; and finally K'múkamtch was changed into the rock Ktá-iti, which stands in the Williamson River (q. v.). The old people of both chieftaincies remember many localities alleged to have been the theater of his miraculous deeds.

K'múkamtch creates the Indians from the purplish berry of the service-tree or shad-bush (*Amelanchier canadensis*, in Kl. tchák), and the color of both has evidently suggested this idea. He also provides for man's sustenance by supplying him with game and fish and the means to capture them;
[192] also with the necessary vegetal products. Objects noticeable through their peculiar shape are called after him, e. g., the *thistle*, the piercer of K'múkamtch, K'mukámtcham k̲ă'k̲. A peculiar haze sometimes perceptible in the west or northwest, shnúish, is regarded as his precursor or that of his son Aíshish.

Although but a passing mention is made of a wife or wives of his, K'múkamtch has a family. The myths speak* of a father, of a daughter, and of Aíshish, his son "by adoption," as members of it. The name of his

---

* Cf. Texts, pg. 100, 2: sk̲ăk̲i'sh p'tís-lûlsham. Mention is made of one-eyed wives of Skē'l and of Tcháshkai.

821 added for "day" and "night." In the Tsimsián and in some of the Selish
171 dialects the terms for both also agree, but in the Shoshonian and Pueblo
197 languages they differ entirely. In Utah and other Shoshonian dialects the term for moon shows the archaic or reverential suffix -pits, -püts previously noticed (ma-atáwa-pits in Utah), which closely corresponds to *παλαίφατος* as used in the Homeric poems.

While the sun divides time into days, seasons, and years, our sections of time called weeks (quarters of the moon) and months (lunations, moons) are due to the revolutions of the moon. This is what caused the Klamath Indians to call both orbs by the same name: shápash *the one who tells*, which signifies: "which tells the time," or "time measurer." For the moon a parallel form exists in the Timucua, once spoken in Florida: acu-hiba *star which tells*, viz: "star measuring the time" and in the name of the Egyptian moon-god Tehuti, called Thoth by the Greeks,* also in our Germanic *mân*, English: *moon*, Germ. *Mond*, "the measurer."

Here as elsewhere the moon appears under different names, for in Klamath she is also called uk̲aúχōsh "the one broken to pieces." This term never applies to the sun, but only to the moon in the four phases, as a
[192] changeable body.† Originally this was only an epithet of the moon, but in course of time it gave origin to a separate deity, for Uk̲aúχōsh distinctly appears as moon-god in a myth, which relates his marriage to Wekétash, a frog-woman living with ten beautiful sisters on the west side of Upper Klamath Lake. Uk̲aúχōsh now carries her, the frog, in his heart, and this is what we are wont to call "the man in the moon." Should only a little bit be left of him when in the bear's mouth (referring to eclipse), she would be able to bring him to life again.

LEMÉ-ISH OR THUNDER.

776 All elementary deities in the Klamath religion, except K'múkamtch and Aíshish, are mysterious, shadowy beings, not sufficiently anthropomor-

---

* Various functions are assigned to Tehuti; his symbol is the *ibis-crane*, whose long, pacing steps evidently suggested to the myth-makers of Egypt the idea, that he was measuring the earth. The name Tehuti is derived from the Egyptian verb teχu *to be full*, for the measuring of liquids, grains, etc., is effected by *filling vases* possessed of certain cubic dimensions.

† Derived from uk̲á-uk̲na *to knock to pieces*.

776 question is of volcanic origin. The natives avoid going near the lake or
823 even ascending the surrounding heights.* Earthquakes are often ascribed by foreign nations to giants stretched out below, who are shifting their underground position. Giants often appear also as ravishers, ogres, and man-eaters, like the Scandinavian Yättur, and two giant-women of the Elip tilikum or "Primeval People," were changed into two columns of sandstone, near the Yákima country, on Middle Columbia River, for having preyed upon the human race.†

776 *Dwarfs.*—A miraculous dwarf is mentioned under the name of na'hnias, whose foot-prints, as small as those of a child, are sometimes seen upon the
[756] snow-clad slopes of the Cascade Range by the natives. But the dwarfish creatures who make them can be seen only by those initiated into the mysteries of witchcraft, who by such spirit-like beings are inspired with a
[192] superior kind of knowledge, especially in their treatment of disease. The name is derived either from néna *to swing the body from one to the other side*, or from nainάya *to shiver, tremble*

[823] [825] Another dwarf genius, about four feet high, *Gwinwin*, lived on Williamson River, where he habitually sat on the top of his winter lodge and killed many people with his black flint hat. He is now a bird.

The Klamaths appear to know about certain spirits having bodies of a diminutive size, but the characteristics of such are not distinct enough to permit identification with the *fairies*, Erdmännchen or Kabeiroi of European mythologies.

ANIMAL DEITIES.

776 The deification of animals in the primitive forms of religion is highly
825 instructive, and instances are so numerous that it would take a series of volumes to comprehend its details. Animal stories and shamanism are

---

* Among the summits of the San Juan Mountains, New Mexico, there is to-day a lake bounded by precipitous walls, and there is a little island in the center of the lake with a hole in it, and something sticks out of the hole that looks like the top of a ladder, and "this is the place through which our ancestors emerged from the fourth into the fifth or present world." The Návajos never approach near to it, but they stand on high summits around, and view from afar their natal waters. (From Návajo Creation Myth, Am. Antiquarian, V, 1883, p. 213.)

† G. Gibbs in Pacific Railroad Reports, I, 411.

173 was born about the year 1840, and since he was a boy then, carrying only a pistol, this
*539 raid may have taken place about the year 1858. His second raid, which was under-
726 taken the year afterward, was made when he was nearly twenty years old. After this he stayed five years in Oregon City, on the Lower Willámet River.

19, 16, and 20, 1. What is said here up to the word snawä'ds is evidently an anticipation of what follows in 20, 6. 7.

[192] 19, 16. sas tillindsa, or shash tilindsha: shash is apposition to wéwanuish, which stands here, as frequently, for wewanuíshash; 23, 5, we find: wewánishash.

20, 2. lápik for lápi gi: "two are, two were."

[487] 20, 9. Tiunō'leshtat. The distance between Klamath Marsh and the Pit River country was estimated at three days' Indian travel; but it often took four days to reach there on horseback. .

[192] 20, 10 and 11. maklaksksákai refers to the encampment and immediate surroundings of the Indian captors, the Klamath Lake men and the Modocs, who had gone with them.

[487] 20, 13. guhuáshktcha. They seem to have returned home over the same trail which they had followed in going south. They passed between Little Klamath and Rhett Lake, which latter is also called Tule and Modoc Lake.

[193] 20, 17. tsúi gé-u, etc. This sentence has to be construed as follows: tsúi gúikaka hú'k lú'gs spunísh gé-u: "hereupon that slave, transferred by me, ran away."

21, 2 and 3. Bóshtin tpä-ók. This man was an American settler on Lost River, [648] who, with other settlers, had previously attacked one of the Pit River tribes, in punishment for depredations committed. In the fight which took place, some whites were killed by the Pit Rivers, and this prompted the abovementioned settler to slaughter an ox for the Lake men, in order to raise their spirits for deadly revenge on the common enemy. The beef was slaughtered and eaten at his farm.

21, 5. Tsúi nat, etc. This incident was explained to me by Dave Hill, as follows: The famous Captain George was at that time war-chief both of the Klamaths and the Modocs. He had ordered Kiukamtch, the head-man of the Nushaltkága=Modocs, to join the expedition against the Pit Rivers. His refusal to go prompted Dave Hill and others to deprive him of his elk-skin cuirasses; but finally, to secure success to the expedition, the parfleshes were returned to their owners.

[193] 21, 7. Húmasht nat. A verb like gi or shúta has to be supplied.

21, 12. séllaluish, translated here by "war-expedition", still retains its verbal nature; for it is connected with two temporal *adverbs:* lupí' and hŭnk. More circumstantially the sentence can be rendered: "we rode far beyond the terminal point of our previous raiding campaign."

[193] 21, 18. léwak, a verb composed of two particles. Gétak and kánktak, formed almost in the same manner, are also used as verbs. Below, léwak is separated into its two components by a pronoun: lä nŭt wák ka-á; lä' nŭt wák gŭldsawiá-a.

21, 19. wéwansni. The terminal -ni turns the wéwanuish into a kind of adjectival phrase. See the peculiar use made of this ending in the Dictionary and in the Grammar.

22, 8. hátaktk. The final k is the verb gi, ki, "said"; tchín hátaktk is: tchí nŭ hátakt gi.

[302] 22, 21. shatchlχámia is one of the various modes of painting face and body in use among the western Indians. White paint was put on in this manner (see Dictionary) only when the Indians were on the war-path. From the same verbal base is derived

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

173 **28, 2.** gépkapsh, formed by syllabic elision from gepkápkash; cf. 29, 10.

*539 **28, 2.** sákatla, to come up, to arrive by the trail.

726 **28, 3** and 4. wéwaliāks pi'la, the old women only; the younger ones, on whom prin-
648 cipally devolves the work of wókash-gathering, found time to escape in their canoes
193 from the raiders.

192 **28, 4.** k'lewidshápka. The men had gone fishing to distant places, leaving their
222 females in the camp, not apprehensive of any hostile attack.

192 **28, 8.** kilō's, or kilū's, is the epithet given to "Dry-Leg", the Snake chief; it means a bold fighter, leader of a fighting band; literally: "irate, wrathful", and may be here taken as an equivalent to "war-chief" (sessalólish lakí).

193 **28, 13.** Moadoki'sh, apocopated for Moadokíshash; also **29,** 1: wéwanuish (wé-
192 wan'sh) for wewannishash (shlää gépkapsh). Nā'lsh tchi'sh, *us* also; that is, we of the
657 Klamath Lake tribe, were gathered by Mr. Perit Huntington into one district, the newly
established Klamath Reservation. A large number of the Lake People were then scattered about Klamath Marsh, which is visited by them now in summer only for fishing, gathering wókash and berries, and for hunting.

657 **28, 14.** Dave Hill, now interpreter (lúldatkish) at the Klamath Lake Agency, took
175 a part in this short but interesting expedition, in the capacity of an Indian scout. He
fixes himself the date of it by the words "tína illolólatko", or a *full* year after the Indians had been gathered on the Reservation by Mr. Perit Huntington. The treaty was concluded on October 14, 1864, and the campaign was undertaken in 1866 by a small body of American troops for the purpose of bringing back to the Reservation a band of Snake Indians who had run away from it. This unruly tribe, jealous of its former independence, has left the Reservation even since then, and could only after much exertion be induced to return. The fights took place west of Warner Lake, and north of the border-line between California and Nevada, within the former haunts of these western Shoshonis.

175 The Report of the Acting Commissioner of Indian Affairs for 1867, page 99 sq., mentions this expedition in the following laconic terms: "October 27, 1866, troops consisting of 21 men, First Oregon infantry, and five Indian Klamath scouts, under Lieutenant Oatman, and 27 men, First Oregon cavalry, under Lieutenant Small, had a fight with a band of hostile Snake Indians near Lake Abbott [should read: Abert], in the Klamath country, Southern Oregon. The Indians had so chosen their position that the troops were obliged to dismount to attack them. The fight lasted one and a half hour, and 14 Indians were killed and many wounded."

On page 100 of the same Report, another fight against Snake Indians is spoken of: "Late in November, 1866, in a conflict between the troops and Snake Indians near Fort Klamath, 10 Snake Indians were killed by the troops, and three more by the friendly Klamath and Moadocs who accompanied them." This may have been the same fight as the one above, reported with much less accuracy of detail.

103 **29, 3.** Spá-ish Valley, name corrupted from Surprise Valley. This valley is situated in the northeastern angle of California, and on the shore of its two alkali lakes several American settlements have sprung up. A few Snake Indians live peaceably around Fort Bidwell, which is located at the northern extremity of the valley.

29, 10. tálaat tχalamti'tal, consonantic assimilation for tálaak tχalamti'tal, due west.

192 **29, 17** and 19. nā'ts, natch, for nā'ls, nā'lsh, nā'lash, *us*; náts a gépksi, for nā'lash a gépkash i.

173
*539

726
648
29, 17 and 18. gayá-itsampk. The advance of the troops was ordered in consequence of Hill's report that Snake Indians had been seen by him and his fellow-scout.

192 29, 19. tû'=hak; hak means: on this side of something or somebody, referring to an object located between the speaker and something more distant.

29, 19 and 20. shlă'pka (for shlă'apka) and tássuipk (for tássui-apk) "they saw and attacked them in Hill's absence"; tínshampk "they scampered off unseen by Hill". If the simplex verbal forms shlă'a, tássui (or táshui), tínshna were used, they would imply that Hill then saw the Snake Indians himself, that he was among the troops charging them, and that he had seen them *in person* scampering off.
193
196

30, 3. lewé-ula really means: not to permit, not to allow, to forbid.

192 30, 3. tchín gi, short for tchí ni gi: "so I said."

30, 5. Instead of gatpánkshkshi could also stand in the text: gatpanuápkshi; the final -i being used in a temporal sense in both terms.

193 30, 8. kû'meta, contr. from kû'mme tchish, or from kû'metat tchish.

30, 9. snashuála, etc. They piled up rocks to serve them as barricades to shoot from behind.

192 30, 11. u-í'tsna, distributive form of ó-itchna; see Dictionary.

31, 7. Nă'wapksh, etc. Transcribed into the fuller and more explicit grammatic forms, this phrase would read: Nă'wapkash yamakíshtana kétcha tχálamna, "to the northwest of Goose Lake." For Nă'wapksh, Né-uapksh, see Dictionary.
193
196

31, 13. This campaign terminated in a decided victory over the runaway Snake warriors, but failed to accomplish its real purpose of bringing them back to the Reserve. Nevertheless, these Indians had been severely chastised by losing quite a number of men killed and wounded, and seven women of their tribe captured by the military.

m'na snáwädsh, tsúi nî snä'kĕlua; gä'tak lak̲í gî hûk.
his wife, then I remove (him); no longer chief remains he.

NOTES.

[177] **58–62.** The legal practices, regulations, and ordinances given here by a subchief of the Klamath Lake tribe are observed by all the chiefs, and are apparently fashioned after American models. The principle which seems to guide most of the judicial decisions of the chiefs, is given in one (59, 20. 21) of these regulations: "If a chief makes law like white people, that will be right."* This article is composed of three parts:

Part I. List of the chiefs acting as judges on the reservation in 1877.

Part II. Legal customs governing the Klamath Lake people.

Part III. Instances of application of these legal customs; amount of fines, terms of imprisonment, etc. These are the "*novellæ*" of Klamath legislation.

58, 1–3. P'lú, Lilu, and some other headmen mentioned here have signed the treaty of Oct. 14, 1864.

[563] [657] **58, 4.** Móatuash. There are only two Pit River *families* living on the whole reservation.

58, 8. Tcháktot belongs to the Yahúskin tribe of Snake Indians. Cf. Ind. Aff. Report 1873, p. 324.

[193] **58, 10 etc.** The future tense employed in these behests, regulations and defenses recalls the French future used in an impressive manner instead of the imperative: *tu ne tueras point, tu ne déroberas point.*

58, 10. shlí-uapk shash. The pronoun shash has here almost the force of a reciprocal pronoun, for the meaning of the sentence is: "do not shoot at people of your own tribe." The same is true of sas in palluápk sas, 58, 10; 58, 13 (twice); pálla shash, 61, 14.

[194] **58, 10.** ksaggayuapkámsni is pronounced as one word, as the removal of the accent from the syllable -uápk demonstrates; and so in many of the following verbs standing in the future tense. For the sake of clearness, I have preferred to resolve these forms graphically into their component elements.

[192] [193] **58, 11.** wátsam, etc. The possessive wátsam stands here instead of the instrumental case watsátka through attraction from wännikísham. Tchíkla here means to ride away on another's horse, the horse being missed by his owner.

---

* Dave Hill introduces himself in the first person as chief; but many of these decisions can be given by the headchief only, not by any of the subchiefs, to whose number Dave Hill belonged. The Modocs at Yáneks claim to observe these regulations; the Snake Indians do not.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 58, 15. shetcháktanuapk stands for the more common form: shitcháktanuapk.

622 58, 16. nánuktua shéshatuish m'na: "all what your husband has transferred to
692 your parents to obtain your hand"; m'na stands for hishuáksham. Cf. 61, 8.

[193] [192] 59, 7. mish, *you, to you,* is often used in this article for málash, málsh, *ye, to ye,* in allocutions to two or more persons. This is a way of expressing what may be called the "inclusive plural of the second person". This mode of speaking is observed in m's lápuk, 59, 7; lápuk mish, 59, 7. In the same manner 1 stands for ăt, 59, 8: 1 sissók-uapk, if ye whip each other; also 60, 22.

59, 9. 1 mi stands for mish mi.

59, 17. hă k̲úi gí'uapk: if he should fail to do his duty; 59, 19. hă tídsh gí'uapk: if he does his duty well; nanuktuánta: in every respect.

59, 22. í'χaks mí: what you may win by betting on the horses engaged in the race.

60, 2. kă'lish is the objective case of kă'liak, kéliak, "not having", the simple form of which, without -ak, would be kă'li or kă'liu (kă'li hû).

[583] 60, 11. túma wátch gitk. The horses have, of course, to be transferred to the parents of the bride and not to any of the chiefs.

[231] 60, 12. wátch. The horses owned by the Klamath Lake and Modoc people are valued from 20 to 25 dollars each; they descend from the hardy, enduring race of Cayuse ponies, and were originally obtained by bartering commodities with the Columbia River Indians at the Dalles, Oregon.

[192] [193] 60, 15. wátch spuni'-uapka; wátch refers to *one* horse only, for the verb spuni', to transfer, is used of one (living) object only; shŭwána is: to give *many* objects. "Not even one horse your wife has to give to you, if she leaves you; but if you leave her, you must give her several."

[177] [595] 60, 17. láp snawă'dshla. Polygamy was abolished by the headmen of the tribe shortly after the establishment of the reservation, and this ruling was one of the greatest benefits ever conferred upon that tribe by the progress of civilization. But those who had several wives then were not compelled to dismiss all but one, and so in 1877 two or three men were still polygamists. The irascible and excitable disposition of the Modoc and Klamath females must have produced many chin-music intermezzos with their husbands at the time when polygamy was predominant.

[193] 61, 3. K̲á-i mi'sh etc. In this paragraph, in: k̲í'tgik, káktak, hémkanktgik, gitkik, the terminal k contains the abbreviated gi, which joined to the foregoing nû, n means *I said.* The construction runs as follows: Hû'nk ni gi k̲á-i mish k̲í'tgi; nánuktuanta káktak gi píla m's n hû'nk hémkanktki gi; nă'-ulakt gí'tki 1 snawă'dshash tchí'sh káktak gi pil. K̲á-i etc.

61, 6. tchik. This particle does not mean *if,* but cannot be rendered *here* (and below) with a more appropriate word. It is identical with tchĕk, *then.* A subordinate clause is here expressed by a co-ordinate one. Cf. 61, 9. 10. 12. 62, 4.

[192] [193] 61, 6. któktatska: "we clip their hair in every instance", is the distributive form of któtchka, któtska, occurring in 56, 16.

61, 9. Tsúi etc. This inverted sentence has to be construed as follows: Tsúi tchiash hishuaksh wutódshish snawă'dsh m'na pă'n hû'nk snúkp'la, tsúi nă'-ulĕkan etc.

*539 683 [697] Tsúi Tétĕmadshish hû'nk shemtchálχa tawí'sht Doctor Johnash k'lekáp-
Then Aunt Susie discovered that had bewitched Dr. John, the de-

plied, for Minnie sending to interpret the agent for conversing with.

NOTES.

64, 1. In September 1877 Púkish, an elderly Indian, died after a very short illness on the western side of Upper Klamath Lake. The rumor that he had been bewitched and thereby feloniously killed by Kákash, one of the conjurers who treated him, soon gained credence, and the excitement in the tribe ran high. The first account of the occurrence was obtained by one of the subchiefs, who, with his colleagues, passed sentence over the unfortunate Kákash.

[192] [193] [551] [769] **64, 1.** hû't, "this one", forms one of the substitutes for names of deceased persons, which no Indian dares to pronounce. Hû't refers to a person standing visibly *before* the speaker, and it is remarkable that the dead are referred to by this pronoun, and not by a pronoun marking distance out of sight, like húkt, hû'kta etc. Cf. hû't híshuaksh, **64**, 9., gén, **64**, 2., hû'nk pí'sh, **64**, 5., **68**, 11. etc The subject nánka kukíaks does not exclude the use of the subject pronoun sha, *they*, the account being worded in the conversational style.

*539 683 [551] [756] 64, 1. Tetĕmádshish or Aunt Susie is one of the numerous female "doctors", who eke out a scanty living from some patients of the Klamath Lake tribe. She received the above name for having been a washerwoman to the soldiers stationed at Fort Klamath, and the nickname Wúya-ak was bestowed on her on account of her predilection for small sucker fish.

64, 2. sämtsálχa. The means employed by her to discover that Dr. John had cast upon the patient a spell of a deadly character, were the singing or recital of tamánnash songs, and the *dreams* which she had on that subject. Her tamánnash songs had *seen* those of the accused conjurer. See 65, 9. The great majority of the tribe still believes in the possibility of witchcraft.

64, 7. The two sentences contained in this line anticipate the result of the whole trial, and the popular verdict. The proper place for them would be after 65, 15.

64, 9. Tuá ni etc. The defense made by Dr. John in his own case is not an unable one, nor is it devoid of oratorical powers. But if the arguments were delivered in the order as given by Dave Hill, they ought to have followed each other in a more logical order to attain their full effect.

64, 10. wák lish etc. The logical connection existing between this sentence and the foregoing has to be supplied by: "why should he have been my personal enemy?"

[192] 64, 10, 11, 13 etc. i, ik stands here for ät (*ye*); because, when the headchief is addressed in council, all the others are addressed also. Lóli stands for lóla i. The trial took place on Williamson River.

64, 13. kúkamtchish. The distributive form is used here instead of the absolute verbal k'mú'tchish, because old age comes on *gradually, by degrees.*

64, 16. tchi insh instead of tchi nish; the language likes juxtaposition of two short equal vowels, even when a metathesis is required.

65, 3. Kátak etc. Aunt Susie's opinion, given just after Púkish's death and some time *before* the trial, did not fail to have a striking effect on the superstitious judges and tribe, for her arguments perfectly agree with the national ideas. But to us the arguments seem so weak, that no conviction seems justified, if not based on other evidence.

65, 9. nä'nsak etc. "Your defense does not disprove any of the points advanced against you."

[192] 65, 11. K'mukámtsam nä'-ulaks: "the old customs of the people."

[124] 65, 16. The second account of this tamánnash-case was obtained a few weeks after the trial; Dr. John was present at the agency buildings at the time of the dictation, furnishing the facts to my informant.

[697] 66, 4. ká-ishnank etc. This underground jail was in such an unhealthy condition that Dr. John could not have lived in it through the tenth part of his long term of imprisonment.

[625] 66, 5. Tchikéskni and Skélag, names of two watchmen (i-álhish); the chiefs appoint watchmen from time to time. Skélag is "the young weasel" and Tchikéskni "man living at Tchikési camping-place". They were armed with pistols to foil any attempt at escape.

[192] 66, 10. nä'dshek for nä'dsh ak: "the only one". Compare nádshiak, 60, 21; waítak, 56, 7. and *Notes.*

[192] [193] 66, 12. shishi'tilatk. The past participle often stands for forms of periphrastic conjugation: shishítilatko gi, they *were* carrying in their dress. Cf. illólatko, 55, 20.

*539
683
[192]
[193]

68, 13. gé'hlaptchapka. The verb gelápka means to step on, to mount, ascend; with 'h infixed, to mount upon something by using one's hands; ge'hláptcha is to perform this while on the way, while going or travelling; gé'hlaptchapka, to perform this at a distance from other people and unseen by them. Doctor John escaped, aided by his son, in the midnight hour.

68, 14. m'na únakam gatpĕnótash. Gatpĕnóta is a derivative of gátp'na with a durative signification, the suffix -óta pointing to an action performed while another is going on. "His son having arrived close by, while he was imprisoned."

68, 16. shnû'ntatka, verbal intentional of shnû'nta, the suffix -tka being sometimes substituted for the usual -tki, -tki gíug.

PUNISHMENT OF MANSLAUGHTER THROUGH WITCHCRAFT.

OBTAINED FROM "SERGEANT" MORGAN IN THE KLAMATH LAKE DIALECT.

*539
755
627
[115]

Tína mák̲laks mä'ntch-gī'tk ná-asht gī: "tû salχī'ta snawédsh gé-u
Once man long ago thus spoke: "over there is bewitched wife my

shíllalsht! ī a-i táwi!" Tsúi tchíkash skúyui suákitsatki gíug; tsúi géna
having fallen sick; you bewitched (her)!" Then an old man he sent out to call a conjurer; and he started

tchíka suákitsuk, tsúi shuákiuk ndéna, tsúyuk túmĕna shuíshuk, kíuksam
the old man to fetch the conjurer, and to call him out halloed, and he heard the magic songs, conjurers'

yaínatat shuī'sh; áti ha shuíshuk. Tsúi géna kíuks tsutánsuk, tû'shtaks a
on the mountain songs; far away (are) songs those. Then goes the conjurer to treat (her), to the spot where

salχíta. At shû'ta hû'nk, tchúi hántsna. Gétpa mû'ns súmmatka, shuī'shuk
she lies bewitched. Now he works on her, and sucks. Comes out a big thing through (his) mouth, to sing

tpéwa, summátka hántsantkiug. Tsúi hántchipka, tsúi putá, tsúi húsatchip-
he orders (those present), with (his) mouth while he would suck on. Then he sucks out, and feels choked, and throws up

gapēle hánshish m'na; sχû'dχa lútatkish. At hû'k sχótka, k̲ú-i hukī' tsutísh
again sucked-out article his; swallows (it) (his) expounder. Now (after) he has swallowed (it), worse that (patient) being treated

gī'ntak, k̲ú-i gī, wigá telsámpka k̲'lä'ksh. Kiúks hû'k tché-ulχa shû'kpal-
in spite of, worse (she) is, almost she looks towards the spirit land. Conjurer the starts to leave wanting to

takiug k̲ú-i gī'sht k̲á-i gī'lχisht pásh; tchúi hû'k ná-asht gī kálamtak
retire worse because she turned (and) not passing through (bowels) the food; hereupon he thus speaks whose own

snéwedsh shī'la shalχī'tnuk, kíukshash: "ī a-i táwi húnksh." Tchúyuk
wife is sick for being bewitched, to the conjurer: "you have bewitched her." But

sakámka kíuks: "k̲á-i a nû táwit! shī'laka hût!" kíuks tchúi nä'sht
opposes denial the conjurer: "not I did bewitch (her)! had become sick (before) she!" conjurer then so

hémkank. At k̲'léka snawédsh.
said. Now dies the woman.

Wudoká	hushtsóχa	sha	kíuksas	sálχitnuk	k̲léksht	húnk	snawédshash.
Struck	(and) killed	they	the conjurer	for being bewitched (and)	having died	this	woman.

627

Tsúi	sa	lúluksla	snawédsh	kíuksam	síuks;	hû'nk	sa	kíuksas	ă'mpĕle
And		cremated	the woman	by the conjurer	killed;	him	they	the conjurer	brought back

tchī'shtal,	tsúi	sa	lúluksla	mák̲laks.
to (his) lodge,	and		cremated (him)	the people.

NOTES.

68, 1 etc. This is a pretty good illustration of the method of doctoring by suction adopted in similar tamánuash cases. Persons sent out to call for the conjurer do not enter his cabin, but loudly halloo outside till he appears; in this instance he is supposed to sing his medicine songs amidst the solitary wilds of the mountain slopes.

192 177 68, 1. mă'ntch-gi'tk. This temporal adverb places the mode of punishment described by the informant among the *ancient* customs of the people. Compared to what is stated here, the trial of Doctor John shows a material modification in the dealings with suspected conjurers, attributable to the influence of the white population.

192 193 68, 1. 10. salχíta is always used in a passive signification, "to be afflicted with the tamánuash spell or bewitching power", which conjurers can send out at will.

68, 1. 2. The words inclosed in quotation marks *anticipate* all that follows up to 68, 10.

68, 2. 8. a-i. This particle has the signification: "undeniably, evidently".

754 68, 5. shû'ta hû'nk. The "working" of a conjurer on a patient's body consists in rubbing, pressing, magnetizing, in blowing on it, and in pouring water over the face or 753 other parts. Sucking out the object which caused the disease is of course the principal operation called for to effect a cure.

68, 5. mû'ns; it is not stated whether this hánshish was a frog, a worm, a small stick, or any such thing; this is immaterial, for the Indian strictly believes that the article was removed from the patient's body and that it caused the disease.

192 68, 6. hántsantking and 68, 8: shúkpaltaking stand for hántchantki gíng and shukpalítki gíng; cf. shû'kpĕli.

68, 6. hántchipka properly means: "he sucks towards himself"; husatchipgápĕle 192 193 "he throws up again to himself"; viz. into his mouth, so as to be able to take it out with his hands.

68, 7. lútatkish is the conjurer's assistant. His office is to repeat his tunes or speeches before those present in the lodge, to expound or explain his sayings, to start songs and tunes in his stead, and to perform such manipulations as mentioned here.

68, 8. k̲'lă'ksh, contracted from k̲'läkápkash, the dead, the deceased; k̲'lekápkash telshámpka, to be on the point of death.

192 68, 8. tché-ulχa: he rises from his seat on the ground, or on a blanket near the patient's couch, for the purpose of leaving.

756 69, 1. hushtsóχa. The killing of a doctor or doctress by the relatives of the patient who died under his or her treatment was nothing unusual in the Columbia Basin until quite recently. In some tribes the third failure in curing brought certain death on the conjurer, especially when he had received his reward in advance.

SHAMANIC DANCE-DIRECTIONS.

GIVEN BY DAVE HILL IN THE KLAMATH LAKE DIALECT.

*539
755

"Wálok mat tû'nepni waitólat nát génuapka kshiuläktsuápkuk we-
"For sweating during five days we shall go to have a dance the

walä'ksh tchísh. At géntak í'lksat pán a. Wû'sa ní lúskuapkug. K̲ílank
old women also. Ye (men) shall go on a feast to eat. I fear I may get too warm. Loud

ät tsuínuapk; túnepni ät nûtísh tsuí'nuapk. At tchísh híhashuaksh ksíu-
ye must sing; at five ye fires ye have to sing. Ye too (women and) fellows begin

laktampka lítstakiank; untsä'g nä'tnag pá-uapk tû'm mbû'shant. "Sílalsh
to dance with exertion; by and by then ye shall eat plenty to-morrow. "Disease

mat nä'baknapk" kíuks ná-asht shápa, yayayá-as mat ná-asht sápa; "kû't-
will come on" the shaman thus says, some tamánuash-medicine (to him) "it is so" says; "of small-

kaks mat síssalaluapk" yayayá-as mat ná-ast shápa. Suássuaktch mák̲-
pox it says will suffer (the people)" the tamánuash just so says. Are weeping peo-

laks nánuk wussóga kû'tχaks. Ná-ast kíuks wálok sápa: "Tánni ílksh
ple all afraid of smallpox. So the shaman before sweating speaks: "How many food-baskets

shä'tu ät? tánkëni at í'lksh? Lápni tá-unepanta pä'n túnep pé-ula;
do ye count? how many already baskets? Twice ten and five;

kánk a ní sä'tû."
so many I count."

NOTES.

70, 1 etc. This is a fair specimen of the careless, jargon-like conversational style in vogue among the É-ukshikni, and without commentaries and glosses it would be impossible to get at the true meaning.

751 These directions are intended to gather the people at the communal dance-house for a dance lasting five nights. The dance is performed around the fires with almost superhuman exertions, in order to produce profuse perspiration and to prevent thereby any infection by disease. 192 The conjurer or shaman is charged with the inauguration of all dances, most of which are of a religious character. This kind of sweating is called "wála", while sweating in a temazcalli or sweat-house is "spúkli". The kíuks is introduced as speaking all these words. The particle mat indicates that the words given are those of another than of the narrator.

192 70, 1. waitólat; in common parlance: túnepni waítash gí'ulank, or: túnepni gíulank, or in Modoc túnepni waitólan.

796 70, 1. kshíulaktcha different from ksíulö̆χa; see Grammar (List of suffixes). These dances take place in winter time and are held from two to four times every season.

562
888 70, 2. wewalä'ksh. This is one of the festivities from which old women are not excluded; they often take part in the dance themselves.

*539 755 70, 2. í'lks (from élχa, ílχa, *to lay down*) is the full dish, basket, or bucket (kála), on which the victuals are brought in; but it means also the food itself, and the dance-feast on which they are eaten. Locative case: í'lksat.

192 70, 3. shuína is often incorrectly pronounced tauína.

194 70, 3. nutí'sh; verbally: while burning fivefold; while five fires are blazing.

70, 3. At tchí'sh: the young men, who strip themselves naked down to the hips during the performance, begin their dance after the women have had one turn.

192 70, 5. nā'bakuapk: see népka, in Dictionary.

193 70, 5. yayayá-as means a certain tamánuash witchcraft which inspires the conjurer: the conjurer tells the people just what (ná-ast) the yayayá-as said to him.

70, 6. 7. *s, sh* is here in three words doubled to *ss*: shíshalaluapka, shuashnáktcha, and wusóga; kû'tχaks forms the indirect object of the first of these verbs.

192 70, 7. wálok sápa. The kíuks gets the inspiration from the yayayá-as only after sweating; then he can tell (sápa) the people, *when* the disease will come.

70, 8. tánkēni: after tánkēni at í'lksh supply ítpa? (did ye bring in?).

70, 8. 9. shā'tu, sā'tu for the more usual form shā'tua; pā'n after tá-unepanta is incorrect and unnecessary; this conjunction should stand there only after ta-unépni or tá-unep.

for eating out.	

NOTES.

*539 755 71, 1. shuákia does not mean "*to call on somebody*" generally, but only "*to call on the conjurer* or medicine man".

71, 2. wán stands for wánam nī'l: the fur or skin of a red or silver fox; kaníta pī'sh stands for kanítana látchash m'nálam: "outside of his lodge or cabin". The meaning of the sentence is: they raise their voices to call him out. Conjurers are in the habit of fastening a fox-skin outside of their lodges, as a business sign, and to let it dangle from a rod stuck out in an oblique direction.

71, 3. tchélχa. During the treatment of a patient who stays in a winter-house, the lodge is often shut up at the top, and the people sit in a circle inside in utter darkness.

[193] [192] 71, 5. linkiámnank. The women and all who take a part in the chorus usually sit in a circle around the conjurer and his assistant; the suffix -mna indicates close proximity. Nadshā'shak qualifies the verb winóta.

[192] 71, 5. tchûtchtníshash. The distributive form of tchû't'na refers to each of the *various* manipulations performed by the conjurer on the patient.

71, 5. mā'shish, shortened from māshípkash, mā'shipksh, like k'lā'ksh from k'lākápkash, 68, 8.

[193] [192] 71, 6. 7. There is a stylistic incongruity in using the distributive form only in kukuága (kúe, *frog*), káhaktok, and in nshendshkáne (nshekáni, ndshékani, tsékani, tchékĕni, *small*), while inserting the absolute form in wishinkága (wíshink, *garter-snake*) and in káko; mû'lkaga is more of a generic term and its distributive form is therefore not in use.

71, 7. káhaktok for ká-akt ak; ká-akt being the transposed distributive form kákat, of kát, which, what (pron. relat.).

[192] 71, 8. lgû'm. The application of remedial *drugs* is very unfrequent in this tribe; and this is one of the reasons why the term "conjurer" or "shaman" will prove to be a better name for the medicine man than that of "Indian doctor".

71, 9. kû'tash etc. The conjurer introduces a louse into the eye to make it eat up the protruding white portion of the sore eye.

KÁLAK.

THE RELAPSE.

[115] GIVEN IN THE KLAMATH LAKE DIALECT BY DAVE HILL.

Hä náyäns hissuáksas mā'shitk kálak, tsúi kíuks nä'-ulakta tchutánuapkuk.
When another man fell sick as a relapse, then the conjurer concludes to treat (him).

Tchúi tchúta; tchúi yá-uks huk shläá kálak a gēk.
And he treats; and remedy this finds out (that) relapsed he.

Tchí huk shuí'sh sápa.
Thus the song-remedy indicates.

Tsúi nä'sh shuí'sh sáyuaks hû'mtcha kálak, tchúi nánuk hûk shuí'sh tpä'wa hû'nksht kaltchitchíkshash heshnampĕlítki gíug.
And one song-remedy having found out (that) of the kind of relapsed (he is), then all these remedies indicate (that) him the spider (-remedy) would cure.

Tchúi
Then

*539 755 hû'k káltchitchiks yá-uka; ubá-us hûk káltchitchiksam tchutĕnō'tkish.
the spider treats him: a piece of deer-skin of the spider (is) the curing-tool.

Tsúi húnkantka ubá-ustka tchutá; tätáktak huk kálak mā'sha, gä'tak
Then by means of that deer-skin he treats (him); just the size of the spot that relapse is infected, so much

ubá-ush ktû'shka tä'tak huk mā'sha. Tsúi hûk káltchitchiks siunóta
of deer-skin he cuts out as where he is suffering. Then the "spider" song is started

nä'dsk̲ank hû'nk ubá-ush. Tchû'yuk p'laíta nétatka skútash, tsúi sha hû'nk
while applying that skin-piece. And he over it he stretches a blanket, and they it

udû'pka hänä'shishtka, tsûi hû'k gutä'ga tsulä'kshtat; gä'tsa lûpí kiatéga,
strike with conjurer's arrows, then it enters into the body; a particle firstly enters,

tsúi tsulē'ks k̲'läká, tchúi at pushpúshuk shlē'sh hûk ubá-ush. Tsúi mā'ns
then (it) body becomes, and now dark it to look at that skin-piece. Then after a while

tánkĕni ak waítash hû'k pûshpúshli at mā'ns-gitk tsulä'ks-sitk shlä'sh. Tsí
after so and so many days that black (thing) at last (is) flesh-like to look at. Thus

ní sáyuakta; túmi hû'nk sháyuakta hû'masht-gisht tchutī'sht; tsúyuk
I am informed; many men know, (thus) in this manner were effected cures; and he then

tsúshni wä'mpĕle.
always was well again.

NOTES.

[192] [193] 72, 1. náyäns hissuáksas: another man than the conjurers of the tribe. The objective case shows that mā'shitk has to be regarded here as the participle of an impersonal verb: mā'sha nûsh, and mā'sha nû, it ails me, I am sick.

72, 1. kálak, relapse. Relapse is not substantive, but adjective in the sense of a person having fallen back into the same disease by which he was afflicted before; kálkĕla, to fall sick.

[533] 72, 2. yá-uks is remedy in general, spiritual as well as material. Here a tamánuash song is meant by it, which, when sung by the conjurer, will furnish him the certainty if his patient is a relapse or not. There are several of these medicine-songs, but all of them (nánuk hû'k shuí'sh) when consulted point out the spider-medicine as the one to apply in this case. The spider's curing-instrument is that small piece of buckskin (ubá-ush) which has to be inserted under the patient's skin. It is called the spider's medicine because the spider-song is sung during its application. A spider-song in use among the Modocs is given below.

73, 5. hă'näshish appears as the subject of an incantation song in the song-list of Sergeant Morgan.

73, 5. gutä'ga. The whole operation is concealed from the eyes of spectators by a skin or blanket stretched over the patient and the hands of the operator.

73, 5. kiatéga. The buckskin piece has an oblong or longitudinal shape in most instances, and it is passed under the skin sideways and very gradually.

73, 7. tánkĕni ak waítash. Dave Hill gave as an approximate limit five days' time.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

NOTES.

*539 221 This text intends to give a sketch of the various occupations of the northern tribe or É-ukshikni in every month of the year, and is partially worded in a form which may be called dramatic. These statements are not always arranged in logical order, but a profusion of ethnologic details gives intrinsic value to them.

[805] The months of the Máklaks year do not coincide with the months of our calendar, for they extend from one new moon to the next one, and therefore should be more properly called *moons* or *lunations*. Twelve and a half of them make up the year, and they are counted on the fingers of both hands. The first moon of their year begins on the first new moon after their return from the wókash-harvest at Klamath Marsh, which is the time when all the provisions and needful articles have been gathered in [796] [224] for the winter. Work is then stopped and the communal dances begin, the doctor-dances as well as those conducted by the chiefs, and everybody participates in them except those who are out hunting in the mountains during the latter part of the year. This mode of counting the moons on the digits was once popular, but on account of its imperfections it is now forgotten by the majority of the tribe. Instead of it they reckon time by the seasons in which natural products are harvested, as: udsaksä'mi, "in the big sucker time"; i-umä'mi, "in the berry season", or they use our calendar months.

The first moon mentioned in our text, gáptche, answers generally to our May. The two next moons are counted on the thumb and forefinger of the hand not used immediately before; with this last moon their year has come to an end. The next five moons are counted again on the digits of the first hand, and so forth. The half moon making up their full year is not accounted for in this text.

[823] [226] 74, 2. Ktaí-Túpakshi is a locality of renown in the folklore of the Klamath tribe. It lies near the confluence of Sprague and Williamson Rivers, on the property of an Indian named Tchéloχins. The otílks is the fish-dam (from utíla), where the Indians wade in the water with their dip-nets and catch the fish while it ascends the river in spring-time in enormous quantities. This fish-dam does not reach the water's surface.

[193] 74, 2. The direct object of lúela is kápto, its subject máklaks hö'ank.

74, 3. kámalsh pahá means: they dry the fish which they have just caught by exposing it to the sun on limbs of trees, and then make kámalsh by pounding it. Kámalsh is a derivative from gáma, to pound.

[192] 74, 3. kó-iχaga is identical with gúikaka; derived from kúi, "away, far off"; guiχátchka is: to start out annually to the prairies where roots etc. are harvested.

[262] [222] 74, 5. saká a pö'ks: they eat *sometimes* the camass raw, but only at the time when digging it. Bulbs, roots, pods, chrysalids and berries are gathered by women only.

[251] 74, 6. pahá at p.; this is equivalent to pahátko pö'ks iwídshat. They bake the camass and put it in their cachés at the place where they intend to stay next winter.

[796] [222] [192] 74, 8. shníkanua. During the time when a pause is made in the gathering-process, the conjurer carefully watches the ripening of the pods not yet harvested and arranges public dances. When the sun has done its work, he solemnly announces it to the women, and they go to work again in their canoes.

[415] 74, 9. shiulína. From the preceding we should expect shiulínat, lulínat.

74, 10. wíllishik is the generic term for larger kinds of provision-sacks; it means here a sack of fifty pounds seed or grain, while the wáχoks holds hundred pounds. In pálasham-wáχoksh, however, the latter word is taken in its *generic* sense of sack, bag.

*539 221 [192] All these different kinds of sacks or bags were originally made of bulrush-stalks (tule) and the táyash was made of straw.

[415] 74, 11. kaítua nû kä'ila. The sense is incomplete. Probably sháynakta is left out: "I do not know of any in the whole country", käíla often standing for käílatat.

[192] 74, 14. áwalues. There are several islands in the shallow waters of the vast extent of Klamath Marsh, but only *one* is meant here.

[103] 74, 15. wö'ns ílktsat. They submerge their dug-outs at several places on the beach, where they are certain to find them in the next wókash-season.

[504] [103] 74, 17. pi'la wí'hla (or píla wíllush) contains perhaps a proper name of a locality, or stands in connection with Tóilkat, "at the Rail-Pyramid"; wílhaslash means top, apex. The stations from the "Ford" to "Bird's Lookout" are passed by the tribe when they return home with the lily-seed harvest-crop. "They drop the rifle" is: they take a rest. All these localities are either on the open waters of Klamath Marsh or on Williamson River, which forms its outlet.

[484] [492] 75, 1. iwí-idsha wókash. The distance between Klamath Marsh and the Williamson River is from 20 to 25 miles, and horses carrying wókash can make it in one day. The next day they return to carry another load.

[482] 75, 2. nátoks waítuapk: we will lie over one day to let our horses rest, or recover from the swellings on their backs. Nátoks stands for nát toks.

[824] 75, 5. klá-ads is probably a kind of wild prunes. See Dictionary: kělátch.

[192] 75, 8. wídsika íwam. "Some are economical with their own berries, and prefer not to scatter them in the hands of others"; íwam, huckleberry, has become the generic term for all berries, and i-umä'mi is "*berry-season*".

[346] 75, 11. spû'klish here means the large communal sweat-house; it is used frequently for dances and kshiuwál'χishtat, contr. kshiû'l'χishtat might stand instead of spúklishtat.

75, 11. papiä'na, vocalic dissimilation for papa-éna; derived from pán, to eat.

[193] 75, 13. atí'sh etc. "Heap ye up that hay in two stacks, which must have a lengthy, long-stretching, and not a high, cone-shaped form!" For heaping up long stacks one verb is here used, and another for making the high, round ones.

Pö'LAM SHUMSHE-ÉLSHTAT SHASHAPKĚLÉASH.

A SKETCH OF BALL'S MARRIED LIFE.

[115] GIVEN BY DAVE HILL, SUBCHIEF, IN THE KLAMATH LAKE DIALECT.

tchía; at sa sipí'tχa, tsúi nä's shnawä'dshla pän Látsam pä'-ia; wáts sïwána
lived; still they separated, then one (woman) he married after (this) Látchash's daughter; horses he gave

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 593 77, 1. The name Púl is pronounced in very different ways, and most people think it is the English name Ball; Póluk is Pŭ'l hû'k; tchía, "lived", would be preferable to t'shin in this connection.

192 77, 2. 3. kă'tsa, kétsa properly means to cast away; here: to abandon, leave; almost identical with wutódsna occurring below, 78, 2.

77, 4. săwána sas: he did not give many horses for her to her parents.

78, 8. pállank sas. This shash properly refers to Pámpi and his family, for Púl's wife took the dug-out canoe of Pámpi and rowed with it to the soldiers. This was in the northeastern part of Upper Klamath Lake, and occurred in the winter of 1876–'77.

103 78, 13. É-ustat is the location of the old agency buildings at Koháshti, in northeast corner of Upper Klamath Lake.

192 78, 14. hí'-i. On that occasion Ball left his wagon in the midst of the woods; hi, hí-i means "on the ground".

657 692 897 78, 15. nă'ulχa sha pă'n. About the middle of September 1877 a strong escort of Indians brought Ball and his wife to the "law-house" at the Klamath agency to be tried by the chiefs. A delay of several days occurred before he was confronted with the judges, and during the time he was imprisoned at the "skúkum-house", a strong log cabin at the agency serving as jail. He is still a very young man, and on being brought there he was allowed to ride on horseback with a rifle on his shoulders. His father is an Indian from the Spokane tribe, and Spúkăn is his name.

192 78, 16. sχókta, to pay a fine; to be fined (by the chiefs). See: "Legal Customs", 62, 5.

GAMES OF THE KLAMATH LAKE PEOPLE.

shû'dshna	yû'ashtala	sha	tchúi.
chase each other	to the bases	they	then.

NOTES.

193
192

I. The game described in this paragraph is played with four shúlshesh-sticks. From this term is formed a denominative verb, shulshéshla: to play the stick-game. It is a guessing game, and the guesses are made known by putting fingers forward, a gesture which is called spélshna. Hence spélshna, sometimes corrupted into spéldshna, is used as a term equivalent to shulshéshla, to play the stick-game; and a third verb for this pastime is shákalsha. More minute descriptions of the three games will follow elsewhere.

79, 1. shi-i'χaga is the reciprocal form of ī'χaga *to win, gain*, occurring below. These terms mainly refer to gains made in gambling.

79, 2. shulshéshlank stands here for the periphrastic shulshéshlank gi, or the simple shulshéshla. Derived from shúlshesh, and this from shúla, to hand over, to pass to another.

79, 2. sχû'tash, not to be confounded with skútash, *blanket*, forms apposition to lápi udshekáne. The two slender game-sticks are wrapped in narrow strips of buckskin leather (skúta, to wrap in).

*539 525 79, 3. sχétcha, to extend two fingers, viz. the index and the middle finger; the instrumental case of the verbal substantive, sχétchashtka: by extending these two fingers.

192 193 79, 3. shlín, to shoot, to shoot forward, to hit; figuratively used for the rapid motion of the hand in guessing at the location of the sticks lying under the tray or pá'hla. yû'shakna, yúshkĕna, or yû'sχa, to put forward, to use the index finger. In this game that finger is called yû'shχish, and not by its usual name, spéluish.

79, 4. vû'ish is the location of the thicker sticks coupled on one side, and of the thinner ones on the other; the gesture for guessing at it is to make a side motion with the hand, thumb included. In the text, the sense would become clearer by wording it thus: vû'ish sha népatka tχopowátka tch lénank shlín, "they guess at the vúish, whirling around with the hand, thumb included." Léna is to perform a circular motion; klátchna, a side motion.

79, 5. sχétchashtka sha láp wí-uka. Sχétchashtka collides here apparently with yû'shχish spélshisht; it seems to stand for: "they win two checks, if they have guessed right at the slender sticks".

79, 5. wí-uka. They win one (nā'shak) of the six checks or counting-sticks, if the party opposite did not guess correctly.

II. To play at dropping beavers' teeth (shk̲û'sha) is the subject of this paragraph; the game itself is sk̲úshash. The four teeth of the beaver are marked for this game by the incision of parallel lines or crosses on one side, and a small piece of woolen or other cloth is inserted into the hollow to prevent breaks in falling. The two longer or upper teeth of the beaver are called the *male* (lak̲í), the pair of lower and shorter the *female* teeth (gúlo, kúlu; distributive form: kúkalu). The teeth are dropped on a hard, level substance, as a metate or grinding stone, to make them lie flat. The marked side of the teeth wins, if it is turned up after dropping. The teeth of the woodchuck (mú-i, mói) serve for the same purpose.

80, 2. Shúshmalua-kipksh stands for shúshmaluash=gípshtka or =gípkashtka, the instrumental case of the participle gitko, possessed of: "(if they fall down) on that side, where each is possessed of marks" (shúmaluash).

80, 2–4. kshĕ'sh. In this game of beavers' teeth (púmam tút), or woodchucks' teeth (múyam tút) they use twelve check-sticks to count their gains with. The game is played by two persons, or by two partners on each side.

80, 5. Kshawínasht tûksh. Kshawína means several teeth to fall down, but, as the prefix ksh- indicates, only *one* tooth with the marked or winning side up.

III. The tchimmá-ash game is played almost exclusively by females. The tchimmá-ash is a string about 2–3 feet long, to the ends of which sticks or pieces of cloth are tied; it is taken up and thrown forward by two flexible willow rods (shuékûsh, wá'hlkish) to playmates, who divide themselves into two parties. Before the commencement of the game, two limits (yúash) are meted out on the ground, which serve as bases. Both of them are located between the lines of starting (shalχuétgish).

80, 7. shuékûsh: *two* poles; players hold one of them in each hand.

80, 9. Kawû'tank refers to the playmates of the opposite party, who are bound to catch the flying tchimmá-ash.

80, 11. shiwákuash seems to be a dissimilation of shiwáka-ash.

80, 11. kíudshna léna, or better: kíudshnank léna.

*539 the ground, both ends being bent over. The process gone through while sweating is
343 the same in both kinds of lodges, with the only difference as to time. The ceremonies
515 mentioned 82, 4–13., all refer to sweating in the mourners' sweat-lodges. The suda-
765 tories of the Oregonians have no analogy with the *estufas* of the Pueblo Indians of
[193] New Mexico, as far as their construction is concerned. Cf. *Notes* to 70, 1. 75, 11.

[192] 82, 1. lápa spû'klish, two sweat-lodges, stands for two *kinds* of sweat-lodges.

82, 5. shashámoks=lólatko forms *one* compound word: one who, or: those who have lost relatives by death; cf. ptísh=lûlsh, pgísh=lûlsh; hishuákga ptísh=lúlatk, male orphan whose father has died. In the same manner, k̲ĕlekátko stands here as a participle referring simultaneously to híshuaksh and to snáwedsh wénuitk, and can be rendered by "*bereaved*". Shashámoks, distr. form of shá-amoks, is often pronounced sheshámaks. Túmi etc. means, that many others accompany to the sweat-lodge, into which about six persons can crowd themselves, bereaved husbands, wives or parents, because the deceased were related to them. Cf. lĕ'pk̲'leχa, lĕ'pk̲'lekatko.

82, 6. Shiúlakiank etc. For developing steam the natives collect only such stones for heating as are neither too large nor too small; a medium size seeming most appropriate for concentrating the largest amount of heat. The old sweat-lodges are surrounded with large accumulations of stones which, to judge from their blackened exterior, have served the purpose of generating steam; they weigh not over 3 to 5 pounds in the average, and in the vicinity travelers discover many small cairns, not over four feet high, and others lying in ruins. The shrubbery around the sudatory is in many localities tied up with willow wisps and ropes.

82, 10. Spukli-uápka mä'ntch means that the sweating-process is repeated many times during the five days of observance; they sweat at least twice a day.

LUÁTPÍSHLA SNÉWEDSH M'NA.

LAMENT OVER A WIFE'S LOSS.

the song-repeater	too,	bewailers,	listeners	also	enter	lodge	his.

NOTES.

[178] The ascetic performances and ceremonies here described are going into disuse at the present time. When they were fully observed, the bereaved husband wandered alone through the woods and wilds (spótu) for five days, but to the widow these observances extended over a shorter time. For this purpose both sexes wore warm clothing, but took to worn-out blankets or old articles of raiment, and used wisps of the serviceberry-bush as belts.

[192] [526] **83, 1.** shpótû: strong and unusual bodily exercise, running up hill, plunging etc. was and is still considered beneficial to the body, and is much in favor with the Indians. Cf. 82, 10. 11.

[192] [193] **83, 1.** hissuáksûk for híshuaksh ak; the husband *alone*, not in company of others; pä'nĕ for pä'n a, pĕn a, cf. átĕnen for át a nen; and sĕ for sha, they, 82, 4.

83, 2. ka-ítua pát or p'át: he eats nothing at the time while wandering; páuk, p'ánk might stand here instead of pát; tû'tahna: for dozing they did not lie down, but tried to catch a little sleep while walking and wandering.

83, 2. shlaá, and tchákĕle 83, 5, forms sometimes used in conversation instead of shläá, shleá; tchä'kĕle, tchékĕli. Cf. yáka for yä'ka, yéka: *Note* to 16, 10.

83, 3. hûshtí'ktamna; the suffix -tamna shows that pshin stands for nánuk pshí'n gí'sh: "nightly, every night."

83, 4. siunō'tish and shuí'sh are both tamánuash-songs, but of a different character. See Dictionary. Shlä'popka: he sees in his dreams what he has heard mentioned in the songs. To sing or repeat songs started by the conjurer devolves almost exclusively on the women present at the ceremony.

83, 5. súmat: into the mouth; their blood, disturbed by the constant excitement produced by the night rambles, ascends to the throat, and is sometimes spit out by them.

84, 2. shuashuáktchish. By their loud and noisy lamentations (shuáktcha, to cry, to weep) they expect to avert from the bereaved husband the effects of the tamánuash-spell (shuí'sh) which he has seen in his dreams.

84, 2. matchátgish: those listening to the words uttered by the conjurer and his repeater or expounder; they are of both sexes and also act as bewailers.

NOTES.

* 539 764 Cremating the dead is a practice which was abolished by the chiefs on the territory of the reservation in or about 1868. At the Indian graveyard north of the Williamson River a hill of 12 feet altitude, where the corpses of Indians of the Klamath Lake (not Modoc) chieftaincy were burnt, is still visible and untouched since then. With the exception of the sentence from Skentanápkash to ítpa, the first paragraph refers to the present as well as to the former mode of funeral, while the second describes [171] the ancient mode of cremation. Cremation prevailed also among the Snake and Pai-Uta Indians, living in the vicinity of the Máklaks; cf. Dr. W. T. Hoffman, Pahute Cremation; Cremation among the Digger Indians, in Proceedings of the Am. Philosophical Soc., Philadelphia; vol. XIV, p. 297 sq., 414 sq., (1876). According to Stephen Powers, cremation prevailed among the Pomos of Northern California, west of the Sacramento River, and the Erio, a tribe living at the mouth of Russian River, believe that all deceased Indians will become grizzly bears if not disposed of in this manner. The Indians inhabiting the shores of Middle and Lower Columbia River placed their dead on platforms erected on hills, or into the canoes of which they had been the owners; the Kalapuyas on both sides of the Willamet River buried their dead by inhumation.

000 Our notice makes no mention of the mourning ceremony among the Modocs, by which widows had their long hair cut off at the funeral of their husbands, then dripped the resin from the pyre, liquefied by the heat, upon their bared heads, vowing not to marry again before this ghastly head-cover had worn off by length of time. The Modocs cremated their dead on any day *from the first* to the fifth day after decease, according to choice.

*539 764 [801] [171] 85, 1. ṭutenépni. Here we have again the sacred number five occurring so often in the traditions, myths and customs of the Oregonian tribes. Cf. 70, 1. 3. 82; 6. 88, 4.

85, 1. Instead of ídsha may be used Klamath Lake ílχa (*or* éna) lulukshàldshuk, to bring out for cremation. The northern dialect uses vumí only in the sense of putting dried provisions into the ground. A funeral is ílktcha in the Modoc dialect.

85, 2. shutédshna: they remove obstacles upon the road or trail, such as fallen trees or logs; they clear the passage. kăflatat means here the same as tchpinŭ'tat, 85, 4.

● [192] 85, 2. wawaíha. Another form of the verb waíha is said to exist in the Modoc dialect: wawaíha; its distributive form: wawawaíha.

85, 3. itpanū'pkasht is the synizesis of itpanuápkasht.

85, 6. Tánkui; the term mă'ntchni is often used instead.

85, 7. ánko for ánkuam kedshlákstat.

85, 10. pítchash for Klamath Lake pitchkash, "until it has gone out".

85, 11. Modoc hibéna or ipéna for the Klamath Lake yépa, yépona: to dig a hole.

85, 11. néwisht. Of this term the original meaning seems to be "thrown by hand into the air", a manipulation resorted to by some Indians, though not here, with the burnt ashes of the deceased.

85, 12. lḳáppa. These piles of stones evidently were, as well as the piles erected on the spot of the burnt lodge, intended as monuments of the deceased. These cairns are of considerable size, and can be seen in the old Modoc country at the present time.

85, 16. pĕn húnkĕlam etc. Pĕn introduces the verb vúmi', and ḳ'léka is a verb coordinate to vúmi': "his children die, right there again they bury them."

*539
766
tsúi sha shiū́'lgip'l tsóχapksh, tsúi sa ánkuala tû'm, tsúi sa kshû'iwal lû'lukshaluapkug.
then they collected the fallen, and they cut limbs (of trees) many, and they laid on the pyre to cremate (him).

Tsúi sa nutá hû'k, nánuktua núta; pualála sha hû'nkēlam tû'kanksh.
Then they fired it, the whole' they fired, cast into they his quiver.

Stútχishla sha yutátkug; k'lékaht shtútχishla.
Sorrowfully wept they in mourning; at his death they wept.

At hû'k nánuk nátspka tchulä'ks, at sa nánuk gä'mbēle lólokshaltkuk.
Now that whole was burnt up body, then they all returned from cremating.

Gátpampēle tchī'shtat shishásahka sha lák hû'k snáwedsh hû'nkēlam wenóya; hissuáksh m'na k'lékaht wenóya.
They came back to homes (and) cut off they hair to wife his, who was widowed; husband her having died she became widow.

Shtíē shupēlóka nû'ss wenóyuk, tsúi spúklitch.
Resin she laid on (her) head because widowed, then went sweating.

Túnlpni spúkēli, k'lä'wi at; at gä'mbēle, kiä'm pán. At gä'tak.
Five (days) she sweated, stopped then; and returned home, (and) fish ate. That's the end.

NOTES.

726
825
The style of this little piece is far from what we would call accomplished, and of incongruencies and unnecessary repetitions there are a score. The fight in which the five warriors were killed is imputed to the presaging, night-long cry of an ear-owl, and in ancient times Indians seem to have been justified by universal custom in attacking and killing their neighbors if an owl or raven was vociferating at night in close proximity to the lodge or lodges of these unfortunate people.

192
193
88, 7. hushtsóχok for hushtsóχa hûk.

88, 9. 10. hushtsóχa is used here in an active sense, but is better translated by the passive form.

89, 1. kshúiwala has for direct object tsóχapksh, the dead body. For the same operation the verb kshäwala, kshäwal is also frequently used: 85, 6. From here the informant begins to speak of *one* body only, as if only one warrior, not many, had been killed in this battle. Cf. *Note* to 89, 5.

89, 2. húnkēlam stands in this line for hunkēlámsham or p'nálam: "their, theirs".

89, 5. lák. After their return they cut off the hair of the widow and then she put pitch or resin on the head. In most tribes they did it *at the time* of cremation, while they witnessed the action of the flames upon the body.

89, 5. hûk snáwedsh: one widowed wife only is mentioned here instead of many: "*pars pro toto*"-construction. This sentence, if built regularly, would run as follows: shishásahka sha lák hû'nkēlam snawédshash, kát hûk wenóya; hissuákshash m'na k'lékaht wenóya.

89, 7. spû'kēli, to sweat in the sweat-lodge, viz. in one of the three sweat-lodges given by K'múkamtch to the Klamath Lake people: spû'klitcha, spû'klidsha, to start out for sweating there. Cf. lumkóka and wála. To eat fish only, and no meat, means *to fast* on fish.

*539
829
192
193
439

93, 1. ka-i spûní vushúk: the subject of spûní, Ê-ukskni máklaks, is left out by inadvertence. Some Wascoes wanted to marry into another tribe; for "one Wasco man" stands here for "some men of the Wasco people."

93, 3. 4. Ampχă'ni, contraction of ambuχĕ'ni "thither, where the water is", where the waters rush down in a cataract, or in răpids. The rapids of the Columbia River at the Dalles impede navigation.

93, 7. sasságanki gi! ye are in peril, when going to the Dalles and being Indians, therefore take care of yourselves! i stands for ât; cf. 64, 10 and *Note;* 90, 13. 14.

93, 7. 9. Instead of ká-i nû shtínta may be said also, in this connection, ká-i nû shanáhole; instead of tánkt ni gĕnt: gĕ'ntĕni, gĕ'nt a ni; instead of Tídshi hă'k: tídshăk, tídshi hă gi.

K'MUKÁMTCHAM AÍSHISHAM TCHÍSH SHASHAPKĔLÉASH.

NOTES.

This is one of the most popular myths current among the É-ukshikni, and we shall find it partially repeated in another myth, recounted by Dave Hill. Aíshish and his father K'mukámtchiksh represent powers of nature engaged in everlasting strife for mutual extermination. In this myth K'múkamtch resorts to the following trick to destroy his offspring. Seeing young larks in a nest on the top of a sorrel-stalk, he informs him, that if he climbs up there, he can obtain a nest of eagles with all its inmates. Gladdened with the prospect of this capture, Aíshish climbs up, but the insidious father causes the plant to grow miraculously fast under him, so that descent becomes impossible, and Aíshish comes near perishing by hunger and exposure.

In the recollection and wording of some portions of the myth my informant was assisted by "Captain Jim."

94, 1–7. The short fragment of a creation myth preceding the Aíshish tale stands in no causal connection with it, and could as well be inserted elsewhere. Myths entering upon the *details* of the creation of the world by K'mukámtchiksh do not, as far as ascertained, exist among this people, but in their stead we have many myths for special creations (of man, animals, islands, mountains etc.). A grammatic analysis of the terms occurring in this fragment (from Lûpí nä'lsh to pátki gí) was inserted by me in the *American Antiquarian*, Vol. I, No. 3, pages 161–166, under the heading: "Mythologic Text in the Klamath Language of Southern Oregon."

192 193 94, 1. Lûpí shutäyéga is not to be considered as a repetition, for it means: when K'múkamtch began to create the world he made *us* before he made the fish, other animals, and the dam at Linkville. This is, of course, only a small fragment of all the creation myths of this people.

94, 2. shashapkēlía: to tell or count stories, myths or fables in the interest or for the pleasure of somebody; the i is here doubled to obtain a rhetorical effect.

94, 3. K'mú'kamtchish is a contraction of K'mû'kamtch tchish; Aíshish, K'múkamtch also. The longer form of the name of the deity occurs 95, 20.

94, 3. ká-akt, metathetically for kákat; kát is pron. relat. which, what, the thing which. nánuktua ká-akt gäg comprehends all animate and inanimate creation.

94, 4. wá, uá, to stay, exist, live in; is always connected with an indirect object indicating the place, spot, locality or medium where the subject lives or exists.

94, 4–6. The construction of the sentence runs as follows: Tchúyunk (K'mukámtch)
né-ulχa gī'tki gíug páplishash I-ulalónan, páltki tī'wish gint ndûlshámpkash mû' nkil-
lipkash, mû'ash shlé-uyuk; "when a south wind blows, it will stop the waters from
133 rushing down rapidly over the cataract." The outlet of Upper Klamath Lake, called
132 Link River, runs from north to south, over the falls at Linkville; hence a powerful
226 south wind will stem the current of Link River above the falls, leave its bottom dry or
almost dry, and enable the Indians to catch the fish swimming in the shallow water
or wriggling in the mud. The rocky ledge under the cataract is supposed to be the
gift of K'múkamtch.

*539 773 192 193 94, 4. I-ulalónan or Yulalóna is the Indian name of the cascade of Link River above the town of Linkville, and for that town itself. The origin of this name is explained in 94, 5. 6, for the verb i-ulalóna means to move forth and back, referring here to the waters of the river receding under the pressure of the south wind.

[103] 94, 6. ítklank, partic. pres. of ítkal, means here: obtaining by basketfuls.

[137] 94, 9. The kĕnáwat is a plant growing high in the warm climate of Northern California, especially in the ancient habitat of the Shasti Indians, and in this myth it suggested itself to the Indians on account of its property of growing very fast.

95, 5. gé'hlapka: he swung himself into the nest by climbing over the rim. Cf. *Note* to 66, 13.

95, 10. kaíχema K'mukámtchish for the regular form K'mukámtchash. Cf. 91, 8.

95, 15. skáyamtch etc. More plainly expressed this sentence runs as follows: sha skáyamna pásh tchish ámbu tchish; the first tchish being placed before pásh and appended to the apocopated skáyamna.

95, 16. shéwana here used differently from tchíya, which applies to liquids only.

95, 17. p'lû' ítchuank seems to be a quite modern interpolation, for it smells of pomade and hair-oil; but it is as ancient as the myth itself.

[765] 95, 23. 96, 2. 3. 4. Tchíka. I have rendered this bird-name elsewhere by "Chaffinch," and Klétish by "Sandhill Crane".

[551] 96, 3. shlámia, to feel insulted. She resented it as an insult that the child called her deceased husband by name; for it was a capital crime among the ancestors of the present Klamaths to call a dead person's name for many years after his demise.

96, 5. hû'tna is changed to hû'tan on account of being followed by a word commencing with k.

[765] 96, 6. stíya. The custom of widows to put pitch or resin on their heads at the death of their husbands was abolished only at the time when cremation became a thing of the past.

[178] 96, 6. galdsha-úyank is a more explicit form of the participle; the verb gáldshui being the contracted form of galdsháwi.

96, 8. yámnashla. He used the bristles of porcupines to make necklaces of.

96, 11. nuakáka m'na was the son of Aíshish and of the above mentioned Tchíka.

96, 11. 12. K'mukámtcham qualifies pä'ks, not lúlukshtat.

96, 14. pakakóleshtka, verbal desiderative of pakakóla, to jerk away from. The suffix -óla indicates that K'múkamtch wore his tobacco-pipe tied to his body; he wore it on his neck.

96, 15. tchitchiks is used when speaking to children. It signifies *so, so!* and means: be quiet, shut up, stop!

96, 17. tche'k kĕléwi. In similar connections this phrase very frequently ends a whole narrative in Modoc and Klamath. Here it means that Aíshish ceased to poke the pipe into the fire. Cf. 85, 10. 89, 7.

96, 18. medshá: he removed from that spot with all his wives and children. Ancient customs forbid the offspring to stay where the father had breathed his last.

96, 20. Gén húnk nánuk etc. This portion of the myth describes the destruction of all the living organisms on earth by a general conflagration caused by K'múkamtch. Myths of this kind are suggested by intense heat experienced in summer. This mode of destroying life on earth is less frequently met with in myths than the drowning in a general flood.

*539 773 192 193

96, 21. kínyäga. Aíshish held the tray over himself, his whole family, and his lodge. The same prefix ki- reappears in a nasalized form in nχí'-ulíga: 97, 1. It is nasalized there on account of the preceding -k in hû'nk.

96, 23. käíla. Where I have rendered this term by "world", as here and elsewhere in creation myths and myths of a similar character, it does not signify the whole surface of the earth as known to us, but only that section of country which is known to that tribe of Indians. Thus ancient creation myths only describe the creation of that part of country where these myths originated; the creation myths of coast tribes will include the ocean in their term for "world".

825 96, 23. Túhush talpatkóla. Mud Hen, one of Aíshish's five wives, looked out from under the roof of Aíshish's lodge or shed to see what was going on. This fiction explains the round dark spot visible on the mud-hen's head; its round form is indicated by the prefix la- in lalíga.

AÍSHISHAM SHASHAPKĒLÉASH.

A MYTHIC TALE ABOUT AÍSHISH.

GIVEN BY DAVE HILL IN THE KLAMATH LAKE DIALECT.

Shashapkēlo-uápkan Aíshishash:
I am going to tell a story about Aíshish:

Aíshish mat sákla tû'ma mákluks íyamnatko; shuédshnuk mat sha
Aíshish, they say, gambled many people having with him; when gambling on their way, so they say, they

shnéna lû'loka. Yámnashptchi mat lû'loks Aíshisham, Wanákalam käkä'kli 3
built fires. Purple-Lime (was), as reported, the fire of Aíshish, of Silver Fox yellow

lû'loks, K'múkamtcham shlíyaksak. Tsúi sa slō'kla; Aíshish shlín túlaak,
the fire (was), of K'múkamtch (it was) smoke only. Then they shot at the mark; Aíshish hit (it) straight,

Wanáka yû'tlansna. K'mukámts tû' hak yû'l'ka, nánka toks tû' hak a-áti
Little Silver Fox missed the mark. K'múkamtch this side of mark struck, the others but farther side of the mark

hak yû'l'ka; tuí sa húmasht gíulank sákaliäga. Túm sa héshkû, tsúi sas 6
struck; right then they after so doing commenced gambling. Many things they bet on, then over them

Aíshish í'kak; séwatkashtka nánuk wátchpka, tsúi sa gä'mpēle. At tû'
Aíshish won; about noon all men had lost all they had, then they went home. Ever

tsússak í'χak nánuk sas.
since he won them all.

Tû'nipnish wéwan's gitk Aíshish: Tûhû'sh násh snáweds Aíshisham, 9
Five wives had Aíshish: Mud Hen (was) one wife of Aíshish,

Stókua násh snáwedsh, Klí'tish násh, Wä'ks násh, Tsí'ka násh snáwedsh.
Long-tail Squirrel one wife, Sand-hill Crane one, Mallard one, Chaffinch one wife.

NOTES.

*539
773 Portions of the same myth, though differently connected, will be found in the
192 mythic tale: K'múkamtch attempts the destruction of his son Aíshish. Both narra-
372 tives are complementary to each other in some important details.

484 99, 3. shnéna. It is the custom of gamblers to build fires at every place where they stop on their road or trail. Any party of travelling Indians will do so when stopping on their way. Cf. 23, 15.

99, 3. Yámnashptchi. Several adjectives designating colors are taken from articles of dress in both dialects: tolalúptchi, green; tchχé-utchχe-ushptchi, a shade of blue; and spálptchi, light-yellow, is called after a face-paint made of a kind of clay.

825 99, 3. Wanákalam lû'loka. The fire of Young Silver Fox was yellow or yellowish, not only because the fur of this fox-species turns from silvery white into yellowish by the change of seasons, but also, because this animal represents in mythic stories the halo around the sun. Cf. shakatcháliah in Dictionary. Wanáka always figures as the companion of the principal national deity, K'múkamtch.

99, 7. wátchpka: to stake everything in one's possession and then lose it all; wí-uka, to win all the stakes lost by the others.

99, 10. 100, 5. Stókua or Stúknaga was, according to another of my informants, a fish of this name, and not a squirrel. The other wives of Aishish all have names of birds.

100, 3. luélks: K'múkamtch had inherited a locality where his father was in the habit of hunting and killing the giant-eagle (p'laíwash). Thinking of this place, K'mukámtch went there with his son Aíshish, after scheming a stratagem to let him perish there. To kill the eagles, it was necessary to climb a pine-tree; this K'múkamtch was afraid of doing, and wanted to send up there his son instead.

100, 9. shnúlas toks etc. The lark had her young in the nest of an eagle.

100, 10. sûlû'tantsa. He dressed himself in Aíshish's garments, as appears from the foregoing mythic tale.

100, 15. sas. Dave Hill often uses shash, sas in an almost reciprocal sense: while (or: for) going to gamble among themselves. This pronoun does not depend here on shnéna, as we might assume. Cf. *Note* to 58, 10. It refers to the playmates of Aíshish, who set out with K'múkamtch, whom they thought to be their beloved Aíshish on account of the dress he had abstracted from him. In 100, 14 shash was explained to me by "from them", viz. from the wives of Aíshish, in whose lodge K'múkamtch had passed the night.

100, 18. gä'pkat for gépka at: did not come now, or: has not come yet.

101, 2. gä'tak. This adverb gives to understand, that they were loth or too tired to play any longer for stakes, because their beloved Aíshish was not present. "To cease or stop gambling" simply, would be expressed by saklóla.

101, 4. shtí'a etc. Cf. *Notes* to 89, 5; 90, 6; and general *Note*, on page 88.

193 101, 4. shí'daho wenépi, rather unusual forms for shí'daha hû vunépni. Hû, "up, above, on head," has coalesced with shí'daha into one word.

101, 5. Klíti'sam. Aíshish heard the cries of Klétish only, because of all the birds which are believed to be his wives, the long-necked sandhill crane is the loudest and noisiest.

825 101, 8. gatpampēlísa for gatpámpēli sha, as tchísa for tchí sa.

*539 101, 8. p'tisá m'na for p'tisha m'nálam.

773 101, 10. k̲ak̲ó bēlat for: k̲ak̲ó pil at.

192 101, 11. p'tissap sam. Sham, sam "their", is found standing instead of m'nálam, 193 p'nálam, or húnkēlamsham in the conversational form of language. Cf. 107, 13. 103, 4.

101, 13. liwátkal. They lifted up the famished Aishish, almost reduced to a skeleton, and seated him upright in the nest; they imparted new strength and life to him by feeding him.

101, 16. k̲édsha, to grow, forms k̲édshna, k̲edshnúta; n's is: nû'sh, to me, with me, under me; a sort of *dativus commodi.*

ORIGIN OF HUMAN RACES. DURATION OF HUMAN LIFE.

[115]

GIVEN BY "CAPTAIN JIM" IN THE KLAMATH LAKE DIALECT.

K'mû'kamtch hû'nk at né-ulχa ná-asht gén: Hû'nk E-ukshikíshash
K'múkamtch ruled as follows: The Klamath Lake
tchák mák̲laks shû'ta; tchúi pén K̲ä'k̲ak̲ilsh tchágsh mák̲laks shû'ta;
from a service-berry bush people he made; hereupon the Käkakilsh from skunks people made;
yámatală génûta shûshtédshna. E-ukshkíshash ktchálχishtat í'lχa, Bósh-
northwards while he had gone he created (them) on his way. The Klamath Lakes in the sun-heat he laid down, the white
tinash toks shûtólank máhieshtat í'lχa; húmasht gíug nä'd mák̲laks mû'-
people however after creating (them) in the shade laid down; therefore we Indians (are)
makmûkli, Bóshtin toksh papálpali. É-ush guní'gshta käilalí'a.
dark, the white race but light-complexioned. The sea beyond he made a world for them.

At sha pä'n ne-ulakiéga, K'múkamtch mû'nk tchí'sh shkishkí'sh tchísh
Then they began to legislate, K'múkamtch, mole also, fly-bug also,
wishí'nk tchísh. Mû'nk häméχe: "Nû a gû'ggamtchíshash mák̲lakshash
garter-snake also. Mole said: "I of old age the human beings
gí'tki gí!" Húnkanti wíshink ná-asht häméχe: "nû'toks gémptcha
to become want!" On that subject garter-snake thus spoke: "and I thus-made
mák̲lakshash gí'tki gí!" Tchíhunk wí'shink shkíntchishχagóta: "gá-ash
the men to become order!" Thus garter-snake while shedding its skin: "this way
nû hû'nk mák̲lakshash k̲'léktgi: tí'dshok nétnāk gít k'mû'tchatk gíntak
I the men to become (want): having grown then to be of old age though
tchíltgipēletám'nûk." Húnkanti mû'nk ná-asht heméχe: "nû a gémptcha
always to grow young again." On that subject mole thus said: "but I thus-made
pshe-utíwashash gí'tki gí: gû'ggamtchishash!" Pí muimû'yuk: "gá-asht
the human beings to become want: decrepit by age!" (And) it shivering (said): "thus
nû pse-utíwashash gí'tki gí!" Skí'shkish tchish ná-asht tok nä'-ulχa
I the human beings to become want!" Fly-bug also thus voted

*539

mû'nkash túlak. Pl skí'shkish ná-asht: "kúi tádsh ak hû'k túmi pshe-
mole along with. It the fly-bug thus (said): "very cruelly many human
utíwash gíug kí'shtchkank hiétalt nûsh".
beings among, when stepping (on me) (will) crush me".

Tchí'hunk pā't háshtaltal né-ûlχûg. Tchúi sha pälpeliéga; mû'nk
Thus they mutually disputed for action. Then they began working; the mole
yaína shuteyéga; shtû'ya yaínaluk. At pí'pil húnta né-ulχa K'mukám-
mountains began to make; it made gang-ways to throw up mountains. Now alone thus (it) made after K'múkamtch
tchām shutólash.
had finished creating.

NOTES.

*539
773
● 192
829

103, 3. tchák. There is evidently a *jeu de mots* intended between tchák and tcháksh. Which northern tribe the Kākakilsh were, my informant and other Indians were unable to say; it is a nickname, derived from kā'k, of some Oregonian tribe held in contempt by the Máklaks, and any reference to it causes great merriment to the Klamath Lake Indians. Máklaks is in both places separated from the tribal name by inversion; tchák and tchágsh form apposition to these tribal names and to máklaks, and for tchágsh we would expect tcháshlsh, which is the usual form of the word.

103, 5. Ê-ush. The sea or ocean, which is meant here, is múni é-ush, while é-ush means a lake, lagoon or large pond.

103, 6. ne-ulakiéga. Three of the lower animals are here brought together to confer with K'múkamtch to determine the duration of man's life, and every one voted according to its own experience. Stephen Powers mentions a mythic story comparable to this, heard by him among the Pit River Indians (Contrib. to North Amer. Ethnology, vol. III, p. 273): "The coyote and the fox participated in the creation of men and animals, the first being an evil spirit, the other good. They quarreled as to *whether they should let men live always* or *not*. The coyote said: "if they want to die, let them die"; but the fox said: "if they want to come back, let them come back." But nobody ever came back, for the coyote prevailed."

103, 9. 10. After shkintchishχagóta supply heméχe, and after k'léktgi: gi.

[193] 103, 10. tí'dsok, or tít'shok, distributive form of t'shók, of the verb t'shín to grow. Cf. tít'sha, 107, 12.

103, 12. pshe-utíwash, abbreviated pshé-utuash, an archaic word used only in the *collective* sense of people, human beings. It occurs only in mythic stories. Cf. 105, 8.

104, 4. shtû'ya. This fiction was suggested by the manner in which moles throw up mole-hills and shows that the ancient myth-makers were not without a humoristic vein.

104, 4. pí'pil. Every mountain was thrown up by the mole alone, each one separately. The special creation of K'múkamtch was *man*, and whatsoever stands in direct connection with his existence, welfare and customs, as fishing-places, islands, funereal sweat-lodges etc.

104, 4. húnta, abbreviation of húntala: by proceeding in *this* manner, in the *same* manner.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

NOTES.

*539 773 [825] In preference to any other beast, the prairie-wolf, small wolf, or coyote (as he is called in the West after an Aztec term meaning "digger, burrower") became connected in the mind of the Indian with the creation of the moon and the origin of the months or moons, because in moonlit nights he is heard howling from nightfall to dawn; sometimes alone, sometimes in packs of several dozen at a time. His querulous, whining howl is likened by the Indians with a "speaking to the moon". Our tale above is based upon the double sense of *moon* and *month*, in which the term shápash (the "indicator," from shápa to tell, indicate) is used. The idea of the creation of twice twelve moons originated in the delusion that in every period called *new* moon, moons were really made or manufactured *new* by the creator. The number twenty-four was perhaps suggested by the observation of lunar eclipses, or mock moons appearing in hazy weather. The coyote as the creator of the moons (and the creator of the universe among the Central Californians) naturally desired to have as many moons as possible; while K'múkamtch, as the wolf's antagonist, thought it better for the benefit of his own
*539 creation, the human beings, not to make the year too long. If the winter had to last
773 twelve months instead of six, how could they collect roots, bulbs, seed, fish, and game
● 192 enough to live through such a length of time?

105, 2. shipátχûkanka. Two moons being on the sky simultaneously would necessarily often cover and thereby eclipse or hurt each other.

105, 2. iggá-idshnank. The mother-coyote had hung up the twenty-four moons made by herself around the walls and ceiling of her winter-lodge, which in this myth signifies the sky. The suffix -ídshna points to her walking from one spot of the lodge to another while busy in suspending the moons.

[776] 105, 3. gú'hli'. A great deal of shrewdness is ascribed to the principal deity of the Klamath Lake people as well as to those of other *hunting* tribes. He manifests his astuteness in entering the coyote's lodge in her *absence* only, and to prepare a trick for her there.

105, 4. tát' né for táta nen.

[194] 105, 5. Hitá tchía! is pronounced as if it was *one* word only: hitátchia.

105, 6. shû'shamka, distributive form of sh'û'mka, to hum, grunt, to make hŭ hŭ. He grunted every time he planted another awl, sometimes in an interrogative tone of voice, and did it to disguise their secret planting into the ground.

105, 7. wákaitch composed of wák haitch; wásha-wéka composed of wásham wéaga; tχéwag or tχéwaga, diminutive of tχé-u first, first in order, eldest; cf. hû'ktag.

[193] 105, 7. tû'm haktch. This language has a term corresponding to our *too much* (tû'm tchátchui), but none which renders our *too* with accuracy. Adjectives or adverbs qualified by *too* are therefore pronounced with a higher pitch of voice and the quantity of their main vowel is increased when the Indian intends to express this adverb.

105, 10. wakaí, "why not," a combination of wák and ḳá-i.

105, 14. gatpanû'la gí'ta: he has come here and has left again.

[825] 105, 16. Kití'ta. The coyote-wolf, while rolling forth and back on the ground, as these animals are in the habit of doing, ran her belly into the bone-awls insidiously planted there by K'múkamtch, so that the entrails shed their contents on the lodge-floor.

*539
773 shlí'n K'mukámtsām hû'nk únakag; tchúi sa híshlan. Tsaskayákalam
shot of K'múkamtch the little son; then they shot at each other. Little Weasel's

shot Weasel's son, then perished both.

At sálĕki ptissísap sham. Tsashgái at káyaktsa, K'mukámts ká-i
Then missed (them) fathers their. Weasel went searching, (but) K'múkamtch not
káyaktcha, skû'lχa tä'dsh sá-utamank; slä'bopk hû'nitak tû' sas hishō'kst.
searched (for them), laid himself on bed but, wrapped up; he knew by himself, out there them to have killed each other.

NOTES.

Compare with this myth the first part of the "Mythic Tale of Old Marten" (Skélamtcham shashapkĕléash), which contains the same subject-matter.

[103] 107, 1. Yámat, contraction of Yámashi. This is the name given at present to a mountain North of Klamath Marsh; from this direction the cold winds (yámash) blow over the highlands on Upper Klamath Lake.

*539
773 107, 1. 3. 9. Tchásbgai sometimes occurs in the diminutive form Tchashgáyak, because the Weasel is regarded as the *younger* brother of the Marten.

192
193 107, 2. saíkăn, a contraction of saigaχĕ'ni: they went *to* the prairie, where the women were digging the edible roots.

107, 3. Skä'lamts. I have given this myth elsewhere in a longer relation, where the part played here by K'múkamtch is played by Skélamtch. Even in Dave Hill's relation the Marten is called, but once only, by its real name Skélamtch; K'múkamtch and Skélamtch are mentioned *here* as identical. The term akĕ'l, when not employed in its mythologic sense, means a long piece or strip of tanned otter or marten skin, used for tying the hair, or for other purposes.

107, 3. 4. I'ktchatki snáwedş etc. One woman only is mentioned here, instead of the two, whom Weaslet was ordered to bring home as wives for his brother K'múkamtch and himself.

107, 5. wéwans a very common elision for wéwanuish.

107, 9. kaní ná-asht? ellipse for kaní ná-asht gi?

107, 10. nû ä'pkolatkik. Instead of this may be said also, ä'pkatki giula nû: "I strictly told (you) to bring in."

107, 13. sa waslalá. The two boys went together hunting chipmunks.

[411] 107, 14. sháwala to adjust stone-heads; shawalia, sa-ulía to adjust stone-heads for or in the interest of somebody. Flint-, obsidian- or iron heads are placed only on war-arrows or on arrows used in killing large game (ngé-ish, ngă'-ish); but the táldshi or lighter arrow, used in hunting birds, and the taldshiága, arrow used as boy's plaything, are usually provided with wooden points only.

107, 15. K'mukámts stûli aht pi'ts stands for K'mukámtchash stuli'sht pi'sh, the pronoun referring to the little son of K'múkamtch.

107, 15. shli'sht. In this sentence m'nálsh is the subject of shli'sht, and the direct object of shlin is not expressed.

107, 16. lä-udsha: they went out to play, from léwa, lä'wa to play.

*539 109, 1. shkä'shgatkaltk. A verbal adjective of shkátkēla, to carry on back; kä,
773 ka is the radical syllable, found also in kä'mat, *back*. This distributive form is appar-
192 ently due to vocalic dissimilation. Women carry conical baskets (yáki) on their backs
[482] when digging roots or bulbs, and throw them over their shoulders into these recep-
[193] tacles.

[222] 109, 2. 6. 8. Skélamtch. See Dave Hill's relation of the same myth; *Note* to 107, 3.
In speaking of somebody who acts on the sly, and differently from what he professes
and means to do, the Klamath Lake people will say: "He acts like Skélamtch." This
[193] is one of the few proverbial locutions, or at least figurative modes of speech that can
be traced in this tribe.

[291] 109, 3. kmä' is the rounded light cap usually worn by females, fitting tight to the skull. It is made of the stalks of aquatic plants, several species of them entering into the manufacture of each cap. The taking away of the skull-caps was intended as a signal for the women to go to their new homes.

109, 6. táta. The words of reprehension addressed by Old Marten to Weaslet are: "Did I ever order you to bring the caps of any other than of both the one-eyed women? I told you to get the caps of both one-eyed women only." Lápuk belongs to shtchûshχápkam, though separated from it by the inversion of the sentence; kmä' is left out.

[193] 109, 6. shtchûshχápkam. The distributive form of shtchû'χa is so difficult to articulate, that abbreviations of it like the above and others, have resulted. Shtchúχa is evidently the medial form of tchóχa, and its meaning is therefore "to suffer destruction on oneself." Cf. shtchúyampka.

109, 10. ni ä'pkatki. After ä'pkatki supply gi: "said, told."

109, 11. The text forgets to mention the calling in of the two one-eyed women.

109, 12. Shû'hank=shitk. In many mythic stories the newly-born children are made to grow miraculously fast, so that when a few days old they handle bow and arrows, and after a month or two they are adult people.

[194] 109, 13. ntéyäla, to make a bow or bows (nté-ish), nteyákäla, to make little bows (nteyága), nteyakalía or nteyakalíya, to make little bows *for somebody*.

109, 13. únak, *son*, is variously pronounced û'nak, vúnaka, wúnak; and so is its diminutive únakag, únakaga, vúnakak, *little son*, "*sonny*".

109, 15. híshla has two meanings, both *reciprocal:* to shoot at each other, and to shoot at the mark, *rivalling to outdo each other* in markmanship. Cf. 24, 17.

[193] 109, 15. Léwatkuk for léwatko hûk: they, after having played; participle of léwa to play.

110, 1. hûshûtánkapksh etc. "This was an approaching himself on the sly towards me" is the literal rendering of this sentence, in which the first term is a *nomen actionis*, a verbal indefinite. The two pronouns are governed by it.

110, 3. mish shli'shtka gi'uapk, if he should want to shoot you; if he should shoot at you purposely.

110, 4. Sháyuakta, "he knew." Omniscience and prescience are among the characteristic features of Old Marten, who is the personification of K'múkamtch. Cf. 107, 1. 3. 14. 108, 5. and *Note* to 107, 3.

110, 6. hútkalpēli, to rise up suddenly, to jump up again (though killed beforehand). Cf. 108, 2.

110, 11. "shui'ulatchgankan hû'n gi." Marten's son said, that his arrow, when

*539 dispatched after a chipmunk, struck a log or tree, glanced off from it and came very
773 near killing Weasel's little son.

192 110, 11. 21. guhásbktcha instead of guhuáshktcha, cf. Dictionary.

110, 17. vû'sho, breast, chest, is also pronounced wû'shu, û'shu; û'shutala, in the chest. k̲'lekiχátko is the distributive plural of k̲'lekátko; k̲'léka, to die.

[193] 110, 18. mä'nshaktch, so long; stands for mä'ntchak tchí. The terminal -ak has to be taken here and in 110, 14. in the sense of the diminutive suffix: "a little long".

110, 19. k̲ä'la to *do* or *act* in the sense of amusing oneself, playing, gesticulating, or acting in a loud, noisy, or grotesque manner.

111, 1. túnepanti. The partitive case in -ti, if it stands for túnepanta, is used here, because the bags of neckwear brought by Skélamtch were counted on the digits of one hand, while those of Weasel were counted on the fingers of the other.

111, 3. wewilína. Beads were left over to Old Marten, because he had brought more than five sacks full to the tchpínû or family burying ground, emptying only five sacks on the child's pyre. This was a fabulously extravagant expenditure, the beads standing high in price and the sacks or wíllishik being rated at more than one bushel each.

111, 4. Mû'sh and Yámsh, syncopated from Mû'ash and Yámash.

111, 9. eíχishtok Mû'shash. The South Wind had put his head out; that is, a south wind had been blowing when Little Weasel died and hence was supposed to be the real cause of his death.

[821] 111, 12. Lĕmé-ishash. From the following it appears, that the five Thunders represent more the flash of the lightning (lúepalsh) than the roll of the thunder. There
are many of them, because the thunder, when rolling over mountains and valleys, often
increases again in loudness after having almost died out, and five is the often recurring "sacred" number of the Oregonian and other Northwestern Indians. The radix
[193] of lĕmé-ish is *lam*, which indicates a circular, whirling motion. The five Thunders are
[342] brothers, living in a winter-lodge or earth-house: Lĕmé-isham tchî'sh, thought to be
a dark cave; their parents, the two Old Thunders, live in a káyata or low, small hut
covered with bulrush mats. The short episode 111, 12-17 does not refer to all the
five Thunders, but only to one of their number.

[321] 111, 13. tû'tash is the long white marine shell, known as dentalium; it is one of
[301] the most common Indian body-ornaments. The white resin flowing out of pine-trees
seems to be symbolized in this myth by the dentalium-shell.

111, 14. wák ish shû'tă, for wák shúta i nish: "somehow do (something) for me."

[193] 111, 20. In wä'shin are combined two locative particles: *í* and *n* (for na).

111, 22. mák̲laks tû'm (for tû'ma). The Thunders brought home as food many human beings struck by lightning.

112, 1. wanúnga, the distributive plural of û'nak; explained in the Dictionary.

112, 1. wennúni a tuá gátpa etc. Here and throughout this paragraph tuá means "some kind of."

112, 2. 3. shkaíni combines the meaning of strong with that of bad or mischievous, and answers to our *demoniac;* shkaíniak or shkaínihak stands for our comparative: stronger. The -tch, -s, -sh appended is an abbreviation of tcha, *now*, and shkáyent stands for shkaini at.

[342] 112, 3. Gékansha. Old Marten had entered the solid "earth-house" of the Thun-

*539 ders, while the Thunders stopped in the small kayáta which was the abode of their
773 parents. To enter such an earth-lodge a high ladder called ga-ulúlkish must be climbed
● 192 on the outside, and another ladder, as long or longer than the other (wakísh) leads into
[342] the interior. Pätchŏ'le nä'shak, pépätchle (for pépätchōle) lápok wakísh: "he had
[417] stepped once", "twice" down on the inside ladder; that is, he had made one step, two steps on it commencing from the top. Each one of the Thunders, when trying to penetrate into their own lodge, gets a little further down than the previous one, but all are driven out by the *chilling*, powerful spell of Skélamtch's headdress.

112, 7. gúlipēlánk. The second of the Thunders, frightened at the ill-success of his experiment, retired again to the low hut or kayáta, where the other Thunders were and where their parents dwelt. This word has two accents on account of shash being enclitic; cf. 111, 2. 112, 13. 113, 9.

112, 8. Tátχēlamni refers in this connection to the relative age of the brothers: "the third in age of the five Thunders."

112, 9. gekanshĕnû'nk: for gékanshna hû'nk. Cf. 113, 12. ktánshan nánui sχolχótak, for: ktánshna nánui shχolχóta ak.

112, 9. gû'tχitkt, a contraction of gû tkitko at.

[193] 112, 11. 12. "Ya! atí' a nä'lsh winnī'χitk tuä'ki." This was said by all the five Thunders simultaneously and *unisono*. In tuá' ki, á is altered into ä', almost ó. The inserted particle hû, û "in the distance, out there, over there" seems to have produced this change.

112, 15. lī'lhankshti l'tpa "he brought some venison," a phrase corresponding exactly to the French: "il apporta *du gibier*"; both nouns standing in the partitive case. These partitives are governed by another noun in 113, 6 (máḳlaksti) and 113, 7.

112, 21. pûelhí': they threw the dead Indians down into the lodge from its roof. The suffix -l- indicates a downward direction, like -fla, -kuéla etc., and occurs also in 112, 17, hä'mĕle, to speak in a downward direction, to shout to somebody standing below. The suffix -hi means down to the ground, or on the ground, earth, soil, and since the lodge-floor is the soil itself, it also means "into, or in the lodge or wigwam".

113, 2. íwa sha tchúi. They put into the bucket the bodies of the dead Indians to stew or boil them up.

113, 2. Nókshtak etc. The gray wolf, the marten and the weasel all being carnivores, there is nothing extraordinary in the fact that mythic fiction lets them participate in a meal consisting of human flesh.

113, 3. háshpa shash. Shash stands for máḳlaksash, the dead Indians.

113, 8. nánuk wû'ta. Marten ate up all the human flesh which he had taken out of the kála.

113, 8. shéwanank. The verb shéwana refers to a plurality of objects, the objects being sometimes expressed by a collective noun, as here (tchulē'ksh).

113, 9. Ké-udshiámtchkash stands for Ké-udshiamtch tchkash; nû'kla is to roast on coals; tchulē'ks is here venison meat.

113, 13. ka-uloktantktám'na. The verbal suffix -tám'na, which marks an action often repeated, or continued for a long time, is not here, as usually, appended to the simple form of the verb, but to its derivative in -tka.

113, 14. Tchékag. The blackbird has yellow eyes shining bright in the darkness,

*539
773
● 192

and on that account the myth makes it watchful at night. This is another bird-species than the *Merula*, known in Great Britain as blackbird.

114, 3. huhashtápkuak. They suspected each other of the trick, by which they had been tied together by the hair when in danger of being consumed by the raging flames, and in revenge stabbed each other. Huhashtápkuak is vocalic dissimilation for huhashtápka ak; cf. shiwákuash, 80, 11.

114, 8. k̲á′hhian. Weaslet missed the heart in the fire when striking at it.

114, 10. sháyuaksh: "You will not be able, or not be powerful enough, to do mischief." The last heart that flew up is a meteor going through the skies, while the four other hearts indicate successive thunder-claps. When a meteor is seen flying west, the tribes of the Columbia River will say: "That's a deceased big man's heart going to the Great Sea." Cf. *Note* to 41, 7.

NOTES.

*539
773
192

The myth of the Bear and the Antelope is one of the most attractive and best stylicized of this collection. It forms a whole mythic story by itself, and not a series of myths like the preceding article. The Grizzly Bear's figure is drawn in very natural and characteristic outlines, and the same may be said of the other animals of the story. Some archaic words seem to prove that the myth has been handed down for many centuries to the present generation, which repeats it to the offspring with the *same* expressions as used by the parents. The archaic terms alluded to are Sháshapamtch, psépsha, pshe-utíwash, kúkui, tchitchû; probably also lepleputéa.

118, 1. 7. Sháshapamtch alternates in this tale with Lû'kamtch, the "Grizzly Bear of the Ancients," and so does lû'kaga with shasháptka. -ámtch, -ámtchiksh is the usual attribute "old" appended to mythologic characters. In the mythologic stories of the Indians bear-cubs always appear *two* in number, the older and the younger one. The same may be said of the majority of the other quadrupeds; cf. the two young of Old Antelope, in this story, and tχéwag, 105, 9, as well as of many of the personified powers of nature. Cf. the term lepleputéa.

[193]

118, 7. 119, 2. gi'nk or kínka: a little, not much; mé-ishi contains the particle i or hi: "on the ground".

119, 9. pû'kpuka: she cracked hard ipo-roots, feigning to crack lice which she pretended to have found on the antelope's body. Picking lice from each others' heads (gútash kshíkla) and eating them is a disgusting practice which travellers have observed among all Indians of North and South America.

119, 10. nánuk: the whole of her body.

119, 11. ipĕnĕ'χi: to place something into a basket or receptacle which is already filled to the brim.

119, 20. 21. hû t málam etc. The construction is as follows: "málam p'gi'shap hû't máklĕχuk shû'dsha, p'gi'sha laggayápkash hû'nk killi't, hûnkiámsham shû'dshash": your mother made a fire out there because she must have passed the night there, and because she hung up this anus on a stick, while the Indians (who gave meat to both of us) had a camp-fire.

*539 120, 2. tchishkuapsht instead of tchishkuápkasht.

773 120, 10. vutátchkia is also pronounced utátchkia, hutátchkia. Earth-lodges which
● 192 open on the top can be closed by means of a large cover placed over the smoke-hole.

120, 11. leplepútéa or properly: leplep-putéa, "to play the smoke out game with two on each side," is a compound of lápěni *two* in the shorter form láp, and púta to be
194 smothering. Láp has changed its vowel into a shorter vowel, e, on account of removal
193 of accent, and is here redoubled by iterative, not by distributive reduplication. Cf. lepχléks from láp and k̲'léka. A series of points after lepleputéa indicates that the animals repeated this word an indefinite number of times, while the others were inside the lodge, and while pronouncing pută', they opened again to let them out.

120, 17. tchúχasht tchĕ'k kaishnû'la. Literally rendered, this means: having perished finally, they uncovered. The subject of tchúχasht, lû'lχagsh, has to be supplied from what precedes. The smoke of the burning rotten wood killed the cubs.

342 120, 19. ga-ulû'lkish, from ga-ulóla to go out, is the outside ladder of the In-
417 dian "mud-house" or winter-lodge, averaging in length from 10 to 15 feet; the inside ladder, wákish, is somewhat longer to reach the excavated floor.

120, 21. The complete wording of this sentence, in which sháptki stands for shápatki, would be: k̲á-i sháptki ging Lúk̲ash, gátpampělisht hû'nksh (hû'nkiash).

193 120, 22. ágguipkash, contraction of aggayápkash: aggáya to be hung up, or to be stuck into; said of long-shaped articles only.

121, 3. anulípka to take away something from another's lodge or house without asking for it; the suffix -ipka expressing the idea of "towards oneself." Anulípkuish, "what was once abstracted from others" appears here in the contracted form anuli'pkûtch; gé-u "by me, through me."

121, 9. tátatatakani shows repetition of the two first syllables of tatákani children, but at the same time means "where are the children?"

121, 15. shálgidsha; the antelopes placed the coals there to secure their flight from the Bear; had the coals been put there by somebody else, lákidsha would be used.

121, 22. 122, 7. hû'ktakag: familiar diminutive name given to the Grizzly Bear; hû'ktag, 121, 23., stands for one of the young antelopes.

122, 1. 2. Mbúshant tchĕ'k etc. The sense of this exclamatory sentence is as follows: "To-morrow at last I will play a sharp game with ye children, when in the day-time I can use my eyes to advantage." Lúlpatka is: lúlpatko a; "possessing eyes" is the primary signification of lúlpatko, but here it means "enabled to make use of the eyes". Cf. múkasham nû lúlpatko: I see as sharp as a horned owl. The distributive form pahépaha, of pahé, "during day-time" means "any time when the sun shines bright." Cf. pahéksh, noon-time.

122, 9. This blowing of personified objects of nature into sticks etc., is a fiction of which we have another instance in 111, 16.

122, 11. ndshenshkáni. See *Note* to 71, 6. 7.

122, 12. 13. tchiwá, tchi'tchu: tchi is a syllable found in many words referring to water and liquids, as tchíya to give water; tchiéga to overflow. This radical is no doubt an obsolete Klamath word for water and recalls the term tchû'k "water" in Chinook jargon: tltsuk in Lower Chinook, tl'tchuku in Clatsop; tchaúk in Nútka. It also occurs under various forms in the Sahaptin dialects. By this lake undoubtedly Upper Klamath Lake is meant. Cf. tchíwa in Dictionary.

*539 122, 15. ga tuá nink for ká-a tuá ni gíank; ká-a means here "vehemently, cruelly, sharply", tuá: "in some way or other".

773

192 122, 16. shash géunish: after they had left the cave.

[193] 122, 20. "aíshing tū'dsh i shásh nen". Here nen stands for some finite verb; either shaná-uli i: you want to conceal them; or for ná-asht i shapíya: "you speak so, in order to conceal them".

122, 23. spū'kua. The spread-out legs of the Crane had to serve as a bridge to the Grizzly Bear, for there was no dug-out canoe at their disposal to cross the river.

122, 23. máksha néklank. Old Crane carried on his leg a vase or skull-cap that belonged to a dug-out canoe, but did not possess a canoe himself.

123, 3. u'hlítcha. Grizzly shook out the remainder of the water to let the skull-cap become dry. Skull-caps are used throughout as drinking vases.

123, 6. táldshitko. This sentence has to be construed: wíwalag, shō'kahām wewákalam táldshitko, ngé-ishan, and táldshitko stands for táldshi gítko: "the young antelopes, armed with the arrows of the Crane's children, shot" etc.

K'MUKÁMTCHIKSHAM SHASHAPKĒLÉASH.

000 THE MYTH OF K'MÚKAMTCH, THE FIVE LYNXES AND THE ANTELOPE.

OBTAINED FROM J. C. D. RIDDLE IN THE MODOC DIALECT.

K'múkamtchíktch hûnk géntko kāílatat, kāílash shutólan, túnep shléa
K'múkamtch walking earth upon, the world having created, five he saw
shlóa ánkotat wawakayápkash. Kaílio skútatko K'mukómtchigsh shpakága
lynxes on trees sitting. In a rabbit-blanket clad K'múkamtch tore to pieces
p'ná kaílio-skútash, heméχen: "tidshí' ûn gé-u skû'tash gítak shlû'a lue-
his rabbit-skin robe, (and) said: "a good to me robe will be the lynxes when
lóka." Ktái pe-uyégan shlóa kai'hhō'ta; nāsh shlóa hûtχídshnan húdshna.
I kill." Stones picking up the lynxes he missed; one lynx jumping down ran away.
Heméχen: "ē, ká-i tídshi skútash gi-uápka!" Pēn kai'hhō'ta ktayátka,
He said: "oh! not a good mantle it will become!" Again he missed with a stone,
pē'n nāsh shlóa hûtχídshnan hû'dshna. K'mukómtchigsh heméχen: "pē'n
another lynx jumping down ran off. K'múkamtch said: "again
nāsh hûtχídsha; at gé-u ketchgáne skútash gi-uápka." Ndáni shlóa wawag-
one skipped away; now my small mantle will become." The three lynxes sitting on
gáyan K'mukámtchāsh shushaluákta; pén ktayátka shlóa kaí'hha. Nā'sh
(trees) at K'múkamtch scoffed; again with a stone the lynxes he missed. Another
pēn hûtχídshna húdshna. K'mukómtchiksh häméχe: "kémat pí'la nísh
one jumped down (and) ran away. K'múkamtch said: "the back only to me

spirit,	would die	I	it	through seeing;	but if	I	recur to magic songs,	then		not

siúgat	nia.
he may kill	me.

NOTES.

[128] My efforts towards obtaining exhaustive texts from the natives concerning their belief in the transmigration of human souls were not crowned with entire success. Of the two items obtained, No. II is intended as a commentary of No. I, both treating [262] of the presence of human souls in fish. The cause why so many Indian tribes shun the flesh of certain fish lies in the fact that these species were seen feeding upon the bodies of drowned men and swimming around them. This induced the belief that man's soul will pass into the organisms of these finny inhabitants of the wave, even *539 when death has resulted from other causes than from drowning. According to Hill, 775 the Mák̲laks believe that the souls or spirits of the deceased pass into the bodies of 787 living fish; they become inseparably connected with the fish's body and therefore 192 cannot be perceived by Indians under usual circumstances. But in *one* status only they become visible to them; when Indians are bewitched by the irresistible, magic spell of a conjurer or of a wicked genius. Then they enter into a tamánuash-dream, and when they see a dead person's spirit in such a dream, they are almost certain to [755] die from it. Only the intervention of the conjurer and of his song-medicine can save them from perishing; rigorous fasting and ascetic performances cannot be then dispensed with, and with all that no certitude of his final rescue is to be had.

[769] Here as elsewhere the pronouns hûk, húnkiash etc., are inserted instead of the unpronounceable name of the deceased, and mean: *dead person, spirit.*

129, 2. pîl mák̲laks; only dead Indians, not dead white men, because during their life-time these did not believe in the skû'ks; this belief is a privilege of the Indians.

129, 2. Hushti'χak etc. This sentence runs as follows: Tchë'ktoks hushti'χa ak nish, hûk tchë'k nish síuksh shanahö'li, wakiánhua tchēk p'násh (or pû'sh) nû'sh shuíshaltki gíug shanahö'li: "if he (the bad genius) makes me only dream in that manner, then he intends either to kill me, or perhaps he wants me to keep the song-medicine [756] for myself." To keep the song-medicine, shuíshli, is to undergo fasts and ascetic performances under the supervision of some conjurer for an almost unlimited time, five years at least.

129, 3. 4. Hä'toks ní' shläát etc.: if I should see (the dead) while I am *awake.*

[193] 129, 4. Skû'ks-kiäm, a compound word, may be rendered by spirit-fish, letiferous fish.

130, 1. Kiä'm k̲'leka etc. The rather obscure sense of this statement may be made comprehensible by the following: "When fish are dead, they are dead forever; hence

*539
775
787

the souls of all dead Indians continue to exist in the living fish, in all kinds of *living* fish only."

[192]

130, 2. tsóχatk. This refers to Indians who have perished by a violent death, as well as to those who died in the natural way.

ing to eat. Then K'múkamtch in wrath their dam spoiled; upon this
nákushχēnkni shlámiuk shtí'ya shishí'dsha shû'ktaldshank lák. Tchúi
the dam-neighbors in mourning pitch put on head, cutting off (their) hair. Then
*539 773 K̲á-ag wétanta shash, ktá-i sha k̲'léka. Tchúyunk K'mukámtch lúpaksh
the Raven laughed at them, rocks they became. Hereupon K'múkamtch chalk
192 shna-ulámna taplálash.
spit over the loon.

NOTES.

[823] I. This myth intends to explain the existence of the large number of rocks found at the locality called Shúyuχalkshi.

[196 / 193] 131, 2. K̲á-ak̲amtch. The adjectives -amtch, -ámtchik̲sh appended to animal names designate mythologic characters. Adjectives of an equal meaning occur in all the western languages, as far as these have been studied. Cf. *Note* to 128, 11. 12.

[825] II. In this myth, as well as in other grizzly bear stories recorded in this volume, this bear is always killed, conquered or cheated by his quicker and more cunning adversaries. Nevertheless his clumsy form and narrow, ferocious intellect are very popular among the tribes, who have invented and still invent numerous stories to illustrate his habits and disposition.

[103] 131, 5. K̲íuti is the name of an Indian camping-place situated a short distance north of Modoc Point, on eastern shore of Upper Klamath Lake.

[193] 131, 6. hátkok qualifies shkû'lχa and yámnash is the indirect object of shûlû'tamantk. Shkû'lχa, nánuk yámnash shûlû'tamantko, wawakshnátko tchish: "he lay down to sleep, keeping all his neckwear on himself, and not taking off his moccasins." Shûlû'tamna can in other connections refer to the clothing, but here it has special reference to the beads.

131, 11. ktí'ukuela. Tradition reports, that Old Grizzly was pushed over some of the high rocks at Modoc Point.

[173] 131, 13. Yámakishash etc. In these words may be recorded the reminiscence of an ancient fight between the Klamath people and some Northern tribe which had come South on a hunting expedition. A Klamath song-line given in this volume also recalls
*539 an ancient inroad made by the "Northerners". The grizzly bear represented the
773 Klamath tribe, the wolf the Northern Oregonians, perhaps as ancient totem signs; the
825 bear having been killed by an intruder, the Klamaths had to take revenge for the insult.

823 III. The object of this myth is to explain, among other things, the origin of the white spots on the head and back of the loon (táplal). But the myth as given in the

*539 [787] Hä' i shma-'htcháktak yaínatat, k̲á-i i ûn k̲ésh shlé-etak; hä'-atoks
If you let your shadow fall on the hill, not you ipo will find; but if
i k̲á-i shma-'htcháktak, tü'm i ûn k̲ésh shlé-etak.
you not let your shadow fall, much you ipo will find.

000 Móatuash, k̲'le-ugtkinápkasht tchíalash Móatuashăm k̲ók̲etat, k̲á-i mhû'
The Pit River Indians, (last) would cease to come the salmon up the Pit River, not grouses
lúela skó; Mō'dokni tchí'sh lóla shuátash kíăm tchûk̲á shátma, humásht-
they kill in spring time; the Modocs also assume, sage-hens the fish to swim up stream invite, there-
gisht k̲á-i lúela.
fore not they kill (them).

NOTES.

*539 171 I. What is contained in these short items refers equally to the Klamath Lake and to the Modoc people, although those contained under I. were obtained from various informants belonging to the former chieftaincy.

[192] 133, 2. páka to howl, bark; pák'la to howl repeatedly, to howl for a while; pákhúpka to howl for a while in the distance towards somebody.

[177] [231] 133, 4. 5. The cat and the chicken being but recently introduced among these tribes, this superstition must have been transferred to them from other animals. By inversion, the words tchíkin gû'lu, *the hen*, appear here widely separated from each other.

[192] 133, 6. K̲ú-i tchămlûk has to be resolved into: k̲ú-i tchĕ mál (for málash) hú'k: "bad then for you this is!" Cruel fights will follow.

133, 7–11. This story is not clearly worded, but we are taught by it how these Indians are conversing among each other with laconic breviloquence. An Indian living in the vicinity has heard the whining of the dog which means death to his owner. He goes there, shoots the man and takes to his heels. A relative of the murdered man comes up and is mistaken by others for the murderer. They deprive him of his wife, his property and his liberty; he becomes a madman on account of the injustice done to him.

[825] 134, 1. 2. The raven (k̲ák̲) is supposed to be a bird of fatal augury, because he was seen devouring the flesh of dead Indians. Compare: General *Note* on page 130.

[202] 134, 4. kíukayunk. They adjust a rag or piece of skin to a pole and stick out that improvised *flag* on the top of the lodge to notify neighbors that they had a dream last night and desire an interpreter for it.

[525] [825] 134, 5. One of the legs of a dead black tmélhak-squirrel is cut off and laid under the gaming-disk or the pá'hla to insure luck to the player.

134, 7–12. Tchásháăsh etc. This is a fragmentary extract of a scurrilous skunk-myth, which I have not been able to obtain in full from my informant, the Modoc chief Johnson, who speaks the Klamath dialect. This myth is well known through the whole of Oregon, for parts of it are embodied in a popular and melodious song of the Mólale tribe, whose ancient home is the country east and southeast of Oregon City and Portland.

134, 7. 8. mák̲laks nánuk is the direct object of hushtaóga; the skunk killed them by his stench.

[601] 134, 9. tû'paks stands for tû'pakshash; túpakship, abbreviated túpaksh, is properly the younger sister, as called by or with reference to an elder brother, while pa-ánip

*539
171
[601]

is the elder sister, called so by or with reference to a younger brother. Two other terms exist for the relative age of sisters among themselves.

134, 11. pátkalp'le. The myth adds, that the eagle got up again at dinner-time and that after washing the face he took a nap before taking his sister home.

[525]
[777]

II. These items were all obtained in the Modoc dialect from J. C. D. Riddle. Many of the articles mentioned as gamblers' amulets are supposed to bring good luck to the gambler on account of their *scarcity*, which must have made them more interesting to the aboriginal mind than other objects of a brighter exterior.

[192]

134, 13. ntággal, ndákal: to find accidentally; shléa: to find, generally, after a search. vumi' is to hide away either on one's own person or in the ground.

134, 16. 18. tídsh tínχa is to succeed, to be lucky; without tídsh in: hútoks tínχantko gi, that man is lucky.

[411]

134, 17. shtáp is a black arrow-head made of obsidian, a volcanic rock found in several places in these highlands.

135, 1. hä'-atoks is formed from hä toks with intercalation of the declarative particle a.

[192]
[193]
[825]

135, 3. k̲'le-ugtki-uápkasht is a periphrastic conjugational form composed of gi-uápkasht, of the verb gi, and of k̲'lé-utka, the usitative of k̲'léwi, to cease, stop, terminate; -utka has turned into -ugt- by metathesis. Literally: "would habitually cease to be in the Pit River." mhû', the grouse, is called by the Klamath Lakes tmû'.

wutuápka	kinkáni	kátchgal;	kinkáni,	k̲á-i	túmi,	tchē'k	pēn	túmi	pákuapka,
I shall spend	a little	tobacco;	(but) little,	not	much,	afterwards	again	much	I will smoke,
pakólank	sχólakuapka.							
(and) after smoking	go to bed.							

NOTES.

Of the two paragraphs of "Reflections" submitted, the first refers to the loss of some hunter's arrows, which had been loaned to somebody together with the bow. The second speaks in a rather egotistical sense of the pleasure which is afforded by succoring helpless and indigent people.

*539
171
● 192
[193]

136, 3. k̲ä'gi. This refers to some arrows, which cannot be found at the spot, to which they seemed to fly.

136, 4. 5. Untchēk, abbreviated undsē, û'ntch, únda, ûns, points to some undetermined epoch in the *future:* by and by, after a lapse of time, some time from now; undsē't, 136, 8., through apocope and synizesis, stands for untsē'k at; undsē'ks for untchēk tchish.

136, 5. Shikútchipk tchiká kēmutsátk, grammatically incomplete forms standing for shikutchípka t'shíka kēmutsátko. The word *stick* is not expressed in the text, but the suffix -ipka, united to shikútcha, expresses the idea of "walking while leaning oneself upon something or somebody". Cf. láyipka, to point the gun at the one speaking; tilō'dshipka, to see somebody coming towards oneself.

136, 6. kí'shtchipka, to step towards the one speaking; cf. *Note* to 136, 5.

136, 7. oní'sh for húnish, cf. ō'skank for hû'shkanka, 65, 1. Húnish is the objective case of hû'n; but this pronoun is not regularly used when speaking of animate beings; hû'nkiash would be grammatically correct.

136, 7. shéwant i. The words oní'sh kiā̆m shéwant i are supposed to be directed to one belonging to the speaker's household.

136, 8. The term kátchkal, tobacco, expresses the idea of an *intermixture* of several kinds of weeds or leaves for the purpose of smoking them.

136, 8. pa-uápk. A more appropriate term than this for masticating tobacco is: kátchkal kpû'yumna.

137, 1. titchéwank. This is in fact the participle of a verb: "I like tobacco, being fond of it."

137, 2. stoyuápka: I shall cut off a piece from a stick of pressed tobacco and give it to him. Cf. stuyákishka, to clip the hair.

137, 3. kinkáni kátchgal. If this and the following were not worded in the conversational slang, it would read: kinkánish kátchgal; kinkánish, k̲á-i túma, tchē'k pēn túma (or tû'm) etc.

[274]

137, 3. k̲á-i túmi. Indians are not often seen to smoke continuously as we do; those inhabiting the Klamath Reserve take a few whiffs from their small, often home-made pipe, then pass it to the neighbor and emit the smoke through the nose. Sometimes they swallow the smoke for the purpose of intoxication, and the elder women smoke just like the men. Cigars offered to them are cut small and serve to fill up their tobacco-pipe.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539
763
[115]

WAILINGS AT THE APPROACH OF THE FATAL HOUR.

GIVEN BY DOCTOR JOHN, OR K̲ÁKASH, IN THE KLAMATH LAKE DIALECT.

"Ngä'-ish a ni tä'lχapksh, gé-u tä'lak, shlín antsa; shkék antsa nû'sh,
"An arrow me striking, my arrow, shot they; they broke (my) head,
shlín nish. Kán ish shlín? Tsuyä'sh ni shlín, gén ish tsuyä'sh mpáta,
they shot me. Who me shot? Through the cap I was struck, this me cap kills,
3 másha n'sh, shlín ish nû'sh, k̲á-a n's mā'sh', guhuá nish, a nish k̲á-a mā'sha!
it pains me, they shot me in the head, intensely me it pains, am swollen I, now me hard it pains!
Pásh ish shéwan i; k̲'lékuapkan pánuk; pálak shéwan i, a nish k̲á-a mā'sha,
Food me give you; I will die after eating; quickly give you, me very hard it pains,
tüä'matk k̲á-a, pálak shä'wan i." At shéwana nû, at pán; shnuk' át mí'dshû.
(I am) hungry very, quickly give you." And give (him) I, and he eats; he takes now the spoon.
6 "At k̲'léka, átěni k̲'léka; tsía at, k̲'leká taks nû; shlín nish nû'shtat.
"Now I expire, now I die; I live yet, dying but (am) I; they shot me in the head.
[764] A ni k̲'léka, ā'těni k̲'lekála." At k̲'leká. Shû'dsha lúluksla sa lû'lokshtat
Now I die, now I am sinking fast." Then he dies. Kindle a fire (and) cremate they in the fire
hû'nk k̲'lékapksh.
the deceased man.

NOTES.

This short incident of war is full of the most dramatic interest, and gives some idea of the oratorial powers of the average Indian. It was obtained from a man who undoubtedly had witnessed more than one similar scene during the numerous raiding expeditions made by his tribe before the conclusion of the treaty in 1864.

*539
763
● 192

138, 1. ngä'-ish a ni tä'lχapksh shlín antsa, forms of the conversational language standing for ngä'-ish a nish tälχápkash shlín a sha. gé-u tä'lak "my arrow," a poetic symbolism for the arrow that causes my death.

138, 1. shkék antsa for shkéka a sha, but nasalized like shlín antsa. Shkéka properly means to pierce, but is used in a medial sense.

138, 2. mpáta properly means to dry up by heat. The cap or hat is said here to kill the man by exciting an intolerable fever heat within him.

[193]

138, 3. mā'sha n'sh. Some impersonal verbs can also assume the personal form of intransitive verbs: mā'sha nû and mā'sha nish: "it pains me"; kédshika nû and nish: "I feel tired". The Modoc dialect prefers the personal form.

138, 6. 7. atěni for at a ni. Cf. sě, 82, 4. tchä'lχet 90, 11. átěnish, atěni 90, 12. 13. gě'ntěni, *Note* to 93, 7. 9.

THE LORD'S PRAYER.

I.

*539
782
177

Nálam p'tíshap, kat p'laí tchía: Nánuk nā'd hû'nk mî shéshash kátak
Our father, which on high lives: All of us thy name truly
shtî'nta. Mî húshkanksh gû'ta nā'lsh. Î hû'nk vû'nhuapk génta käílatat,
worship. Thy mind come to us. Thou wilt achieve on this earth,
wákaktak p'laítalknî gi. Shéwan î nálsh gē'n waítash nálam pála-ash 3
equally as (thou) on high dost. Give thou us this day our bread
nánuk waítashtat. Hă nálsh tuá k̲ó-idshi gíntanuapk, k̲á-i hûn, p'laítalkni,
every on day. If on us any-thing wicked should stick on, not it, thou on high,
hû'shkank î! húmashtak nā'd k̲á-i hû'shkankuapk, hă kaní nálsh k̲ú-i
mind thou! just as we not would mind it, if somebody us wrong
gî'uapk. K̲á-i nálsh î tuá shutétki k̲ú-idsha, î inúhuashkpak hak nálsh 6
should do. Not to us thou any-thing let do wicked, (but) thou keep away only from us
tuá k̲ú-idsha. Húmasht giúg mî né-ulaks, nk̲î'llitk tchî'sh, ktchálshkash
any-thing wicked. For thine (is) the rule, force also, glory
tchîsh tchúshniak. Húmashtak an hûn gîtk gi!
also forever. Thus I it to be say!

II.

Nálam t'shî'shap, p'laí tchía: Mî shéshash nánuk stínta; mî k̲óχpash 9
Our father, on high (who) livest: Thy name all revere; thy mind
gáltchui nanukă'nash nā'l. Gitá tchî'sh käíla humashták gi, wákaktoksh
come to every one (of) us. Here too on earth in the same manner be done, just as
p'laí ki. Nálash gēn waítash shápěle shéwan î. K̲á-i nálash k̲ó-i shû'tă,
on high is done. To us this day bread give thou. Not us wicked render thou,
húmasht nálam mák̲laks-shítko stínta. I huáshgi nálamtant k̲ó-idsha 12
equally as our men-kindred (we) love. Thou keep off from our bad
steínashtat k̲óχpash; tídsh nálam steínash shútă. Mî tála litchlítchli, mî
(from) heart thoughts; good our heart make thou. Thine alone (is the) power, thy
steínash litchlítchli tchússak, mû'ni lák̲iam steínash. Húmasht toks tídsh.
heart strong (is) perpetually, great of the Lord the heart. Thus (it will be) well.

NOTES.

These versions of the Lord's Prayer are good instances of what can be attained, without using too many circumlocutions, in rendering religious, moral and other abstract ideas in a language deficient in many of them.

[192] For reign and kingdom no words exist, and they had to be rendered by hû'shkanksh, or in Modoc k̲óχpash, "mind", né-ulaks, "rule, law"; sin and forgive were

192
[193]

rendered by "something wicked" and "not to mind"; for "thy will be done" stands "achieve thou". Power and glory become "force, impetuosity" and "radiance", and daily bread: "flour on every day". In the Modoc version, the wording of which is inferior to that of version I, the use of similar expedients will be observed.

I. In the Klamath Lake dialect; by Minnie Froben.

139, 6. inúhuashkpak, phonetic inversion for inuhuashkápk' î; see Dictionary.

139, 7. ktchálshkash, from the word ktchálχa, to shine, to be radiant, resplendent.

139, 8. gitk, in an hûn gitk gi, is the verbal intentional gitki.

II. In the Modoc dialect; by the Riddle family.

139, 10. Gitá käfla is equivalent to gē'nta käflatat; in humashták gi the verb gi has to be taken in the *passive* sense.

139, 11. ḵó-i shû'tä: "do not render us wicked." For shútä compare 111, 15. and *Note*.

139, 12. húmasht nálam. Between these words and the preceding ones there is a lacune in the text. máḵlaks-shitko, "our kindred": those who look like ourselves.

139, 13. 14. In mî tála litchlítchli the adjective strong stands for "strength, power", while in mî steínash litchlítchli it is used in its adjective signification. In this language abstract ideas are sometimes rendered by adjectives and by verbal adjectives in -tko.

DIALOGUES.

I.

*539

Tsématk. Tatá lish sha ksíulakuapk?
When they will dance?

Skä'lag. Pá-ak ḵá-i an sháyuakta! uná a sha ná-asht she-édshtat mat
Not I know! once they so (said), on Saturday
sha nánuk shûkû'lki-uapk kshí'ulχish.
they all will assemble for the dance.

Kápuak. Tátai tchí'k sha kshíulakuapk? Plē'nkamkshi á? tám hak
Where after all they are going to dance? At Frank's house? perhaps
haítch î hû'nk shlääátk? ḵúi a sha nen hûnk máshish gish shápa.
(did) you him see? seriously they him diseased to be say.

Skä'lag. Káyak an hátokt gátpantk, ná-asht tä'dsh toks nû tû'mēna gén
Not I there was going, thus however I heard this
mbû'shant pîl, mat pá-ula: gät tóks nû wátch káyaktgûk, kúinag
morning only, (that) he was eating: out there I of my horses while returning from the search, away from any house
gépgapēle.
I returned.

Kápuak. Tám haítch î nä'gsh shíwaksh shlää gúni, gémpktch Kúy-
(Did) you absent from home the girl see over there, who went to
amtsχēksh, Ellen Débidam mû'kag shétaltchapksh mā'shisht?
Kû am Shä'vksht, of Allen David a baby to visit having fallen sick?

Skä'lag. Ḵá-i an tû'sh shleá pûsh. **Kápuak.** Î.
Not I anywhere saw her. Is that so?

*539 Skä'lag guhuáshktcha; Käptinámkshi tchkash sha vûlánkia: "Tát i
Skälak left; at the Captain's lodge also they inquired (of him): "where you
tamnû'tka?"
come from?"

Skä'lag. Gē'ɪ an wátch káyaktka, ksíulakshχēn genû'tuapkuk.
Through there I of (my) horse returned from the search, towards the dance-house while intending to go.

Captain. Táta haí tchí'k sha kshí'ulaktchuapk?
Where finally they are going to dance?

Skä'lag. Mbû'shant a sha she-édshtat kshíulaktchuapk Mbû'shak-Shiwáshkni, ák tchísh nánuk gépkuapk.
To-morrow they on Saturday will dance the dwellers at Mbû-shak-Shiwash, probably too all will come.

Tchúi guhuáshktcha gémbaluk.
Then he started off to go home.

II.

Hlékosh. Tát lísh mí û'nak?
Where (is) your son?

Pépakli. Le-utchólan kaní' úna geknō'la; le-utchólan tunepä'nish tatákiash túla.
For playing outdoors a while ago he went out; for playing five children with.

Hlékosh. Wakaítch gé-uga kaí gépgaple?
Why not returns he?

Pépakli. Tútaks atí léwa; hótaks tatáksni waíta léwapka; lítki gatpampēli-uápka.
Away far they play; those children the whole day will play; in the evening they will return home.

NOTES.

*539
192
[193]

I. Dialogue about a dance to be held on the Williamson River; in the Klamath Lake dialect, by Minnie Froben.

140, 2. Pá-ak ká-i an sháyuakta! is interpreted by "what do I know!"

140, 9. nä'gsh shíwaksh gémpktch stands for négsh shiwákash genápkash. It is very rare that diminutive nouns, like shíwak, shíwaga, assume the ending -ash in the objective case; cf. 23, 10. But shíwak means not only a little girl; it means an adult girl also, and is therefore inflected like snáwedsh.

140, 9. Kúyamtsχēksh. For this local name cf. Page 91, first *Note*. Frank and Allen David live both at that place, close to the steep western bank of the Williamson River, while the communal dance-house, a spacious, solid earth-lodge, lies further to the northeast.

141, 5. Mbû'shak-Shiwáshkni, term corrupted from Mbû'shaks-Shawálshkni: "the one who lives, or those who live at the locality of the obsidian arrowheads." Mbû'shaks-Shâwalsh lies on the eastern shore of the Williamson River. Cf. *Note* to 134, 17.

II. Dialogue in the Modoc dialect; by Toby Riddle.

141, 9. Léwa, to play, forms the derivates lé-utcha to go to play; lé-utchna to play while going, to play on the way, cf. shuédshna 99, 2.; le-utchóla to go to play in the distance.

*539
192
193

141, 11. gé-nga for the more common giuga, giug.

141, 12. léwapka to play in the distance, out of sight, or unseen by us; but here this term is more probably a synizesis of léwnapka, the future tense of léwa.

NAMES BESTOWED ON UPPER KLAMATH LAKE LOCALITIES.

GIVEN BY DAVE HILL IN THE KLAMATH LAKE DIALECT.

K'mukámtch mat käfla shû'ta. Tsúyunks ä'-alk käfla shutólan:
K'múkamtch, so they say, the country made. The following names gave he, the country after creating:

Tuli'sh käfla E-ukski'shash shúta K'mukámts kiäm-luelkalí'a; Tulí'sh tsí-
"Tulish" place for the Lake people made K'múkamtch to be their fish-killing place; Tulish,

hunk ä'lχa. "At hû'nk käfla git ktaíksi Shúyakēksh tchín ä'lχa; gíti
thus he named it. "And that spot there where the rocks are, "Jumping-Rocks" so I name; here

shuyéakēks gi-uápka". E-ukskísas K'mukámts né-ulχank hemé χe:
a leaping place shall be". To the Lake people K'múkamtch ordering said:

"Tû'kua ná-asni kä'la nā'sni élχa gí'ta Tû'kua; Gû'mbat nā'sni git élχa;
"Túkua so I a spot, so I name here Túkua; Kúmbat so I there give name;

gíta Kä'lalksi nā'sni élχa gí'ta. Wakáksi spû'klishtat gí't i spû'kle-uapk;
there Dirt-hauling place, so I give name there. At Wáka in the sweat-house there you shall sweat;

hä' me wéash k̲'lä'kuapk gí't i spû'kle-uapk, hä' mi snáwedsh k̲ēlákuapk
if your child should die, there you shall sweat, if your wife should die,

gít i spû'kle-uapk túnepni gitá; túnepni spû'kle-uapk snawédsh, hä' mi
there you shall sweat five (days) there; five (days) shall sweat (you) wife, if your

hishuáktch k̲ēlä'kuapk. Túnepni spû'kle-uapk, tsúi k̲íllitk tsulä'ks gí'-
husband should die. Five (days) you shall sweat, then strong (your) body will

uapk, k̲á-i pálak i kĕmútchuapk."
become, not fast you will become old."

"Nāsht ni ne-û'lχa Á-usmi shéshuapk; nā'sni élχa gēn käfla.
"Thus I ordain Á-ushmi to be called; thus I give name to this spot.

Koháshti ná-ast ni élk̲a gí'ta. Ē-uk̲alkshi nā'sni élχa gí'ta; gí'tats spû'kle-
"Set out" thus I call that place. E-ukalkshi so I name this place; here also you shall

uapk, tuní'pni i spukle-uápka wéas k̲'lekáluk, tû'nipni snawédshēsh k̲ēle-
sweat, five (days) you shall sweat a child after losing, five (days) a wife after

káluk hishuáksh tchish; k̲á-itoks mi sa-ámoks k̲ēlékst k̲á-i i spû'kle-uapk,
losing, a husband also; but not, your relatives having died not (there) you shall sweat,

hä' mi sa-ámoks nánuktua tsók̲uapk. Ká-i i gitá spû'kle-uapk ndānnántak:
if your kinsmen of all degrees shall have died. Not you there will sweat but for three:

snawédshtat, hishuákshtat, wéashtat."
for wife, for husband, for child."

*539
773
103

"Nakótk Wi'tlas ḵoḵétat hí tchí'sh luélks-kiäm gí'-uapk; na-ást shé-
"By (its) dam Witlash in Williamson River there also a fish-killing place shall be; thus

shash élχa ni: Ktá-i-Tupáksi. Mbû'saks nä'st shéshatk máḵlaks gí'-uapk;
name give I: Rocks-where-stand. "Obsidian" so called a people shall exist;

Smä'k nä'st sésatk gí'-uapk máḵlaks gí'ta. Kä'katils nä'st sésatk gí-uapk
"Hairy" so named shall exist a people there. "Armpit-hairy" so called shall exist

gí'ta máḵlaks."
there a people."

NOTES.

All Máḵlaks admit that K'múkamtch created their country, the earth and the universe, but as to the special process by which he created them they seem to have no definite idea, though they possess a multitude of myths for special creations.

Most of the places mentioned in this item are situated around Upper Klamath Lake. That they are localities inhabited for centuries past, and identified with the history of the tribe is proved by the fact that their naming is ascribed to K'múkamtch. The most noticeable of them are no doubt the three sweat-houses, all of which are of remote antiquity, and were put to use only when families were mourning the loss of one of their members. Two of them are quoted here: Wakáksi or Käilalkshíni spúklish on west side of Lake and Ē-ukalksi, a short distance south of Fort Klamath. The third lies about three miles south of Modoc Point; it is called Ká-ashkshi spúklish.

*539
773
103
192

142, 1. käíla. About the meaning of this term in creation myths, cf. *Note* 98, 23. In other connections, in the present text, käíla or kä'la means spot, locality.

142, 2. 3. Tulísh. To enable the Indians to catch fish at that place, K'múkamtch built for them, as tradition has it, an obstruction resembling a beaver-dam. Cf. nakótk, 143, 1.; gíti for gíta hí.

142, 3. 5. Túkna and Koháshti are camping- and fishing-places on the eastern shore of the Lake. At Shuyakē'kish the Indians leap over rocks for amusement.

142, 5. ná-asui, ná'sni stands for ná-asht ni: "thus I".

142, 5. 11. Gúmbat is called Rocky Point by the white population, and lies on the western shore of Upper Klamath Lake. A-usmi is an island of the Lake.

142, 6. Wakáksi or Wáka is named after the tuákish-fowl whose cry is wáka wáka.

765
177

142, 6–10. 12–16. These mourning customs are gradually disappearing at the present time. One reason for this is the progressive assimilation of the tribes to American customs, another is the circumstance, that all of the three ancient sweat-houses are situated outside of the reservation limits.

142, 15. ndânnántak is composed of ndánnanti or ndánnantat ak: "only for three (kinds of relatives)".

193

143, 1. Nákotk is the instrumental case of nákōsh, lumber-dam: "on account of its dam Witlas will be a fish-killing locality." A loon destroyed that dam by forcing its way under it; one of our texts gives this myth. Cf. 132, 1–8 and *Note* to 74, 2.

829

143, 2. 3. Mbû'saks, Smä'k and Kä'katils are names given in contempt or derision of the respective tribes; the latter to Indians living at the Dalles of Columbia River, Smä'k to a tribe living south of that locality. Cf. 103, 2. 3. Mbû'saks is a name for the Snake Indians.

MISCELLANEOUS NOTES ON ANIMALS.

GIVEN BY JOHNSON, CHIEF AT YÁNEKS, IN THE KLAMATH LAKE DIALECT.

Nī'l	wéksa	pû'l'hka	mák̲laks	shû'lhashluk	sχō'lhok;	ktánuapkuk
The down	of mallard-duck	pull out	the Indians	to make pillows	to lie on;	for sleeping

sχō'lhank	nī'l	ikúgank	willishī'kat.
(and) resting	the down	they are putting into	pillow-cases.

3	Mbû'shant	nílaksht	wísχak	hä'ma.
	In the morning	at dawn	the wisχak-bird	sings.

Wátsak	wáwa a	gulíndshisham;	le	génug	wáwa.
Dogs	howl	because left behind;	for not	going (with them)	they howl.

Yá-ukal	tchaggáya	ánkutat	ä'-unank;	untsä'g	ā-unólank	húndshan-
Bald eagle	sits	on tree	replete with food;	after a while	after depleting himself	he will

6	uapk,	tó-ugshtant	húndsanuapk	Ä'-ushtat.
	fly off,	to the opposite shore	he will fly	of Upper Klamath Lake.

Tché-u	gankánkatchuapk;	tí'tnāk	mák̲lakuapk,	wakiánua	lápěni;
Antelopes	(people) are going to hunt;	once only	they will camp out,	or perhaps	twice;

shlíuk	gépgapluapka	pálak.	Úndsh	mbúshant	pä'-uapk	sχólăkok.
after shooting (antelopes)	they will return	at once.	Some time	next day	they will take a cold bath	to induce sleep.

9	K̲ó-i	shû'ta	wásh,	pálla	n'sh	wásh;	k̲ó-idshi	wásh.	Múatch	kpē'l
	Wickedly	acts	prairie-wolf,	steals	from me	prairie-wolf;	mischievous (is)	prairie-wolf.	A long	tail

gī'tko,	tidsá	nē'l	gítko	wásh.	Kinkáni	wásh	É-ushtat.
(he) has,	delicate	fur	has	prairie-wolf.	Scarce (are)	prairie-wolves	at Upper Klamath Lake.

Kaí-udshish	nísh	k̲ópk̲a;	k̲ílōs	k̲é-udsis;	shlá-a	nísh	talatskágantko
Gray wolf	me	bites;	impetuous	is gray wolf;	(when) sees	me,	jumps on my throat

12	k̲é-udshish.
	gray wolf.

NOTES.

[192] 144, 1. nī'l wéksa stands for nī'l wéksam; pû'l'hka for púlχa or púlk̲a: -'h-, "by hand."

144, 9. 10. These characteristics of the prairie- or coyote-wolf, which is so highly reverenced by the California tribes, place him between the wolf and the fox. Nē'l stands for nī'l and múatch for múnish. Tidsá is tídsha a.

[192 193] 144, 11. tslatskágantko; the verbal adjective of tchlakága stands here in the distributive form: "each time when he sees me, he jumps on my throat." The l of the second syllable is suppressed.

knives scraping (it), smear it on faces, themselves from sun-burns to pre-

luápkasht; p'lû' tak sha íwínank shtéwa.
serve; grease they putting into mix up.

NOTES.

[193]
[196]

Several plants in this list appear, according to grammatic rule, in the possessive case -am, while their fruits or edible portion are introduced in the subjective case. To the former the substantive ánku or taélash has to be supplied. Small grasses are alimentary plants on account of their seeds only, while the larger aquatic grasses contain nutritive matter in their stalks. Of these notices the shortest and most laconic were obtained from Morgan, who did not enter into particulars concerning the preparation of aliments. By this list the articles on which these Indians feed are by no means exhausted; they eat almost everything found in nature which is not positively obnoxious to health and which contains a particle of nutritive matter, and hence a full list of their kitchen *répertoire* would be at least three times as long as the one obtained.

*539
262
824
192

146, 1. kak tán for ká ak tánni "so long only"; the length being shown by gesture of hand. Also expressed by ka taniáni, 149, 1. and *Note*. The yántch-plant grows to a length of 18 to 20 inches, the height of the camass- or pû'ks-plant.

146, 3. Kápiunksăm. The kápiunks-seed grows on a prairie-*grass*, like the tchípash- and nû'tak-seed.

[193]

146, 7. 14. pálpal stands for pálpali (originally pálpal-li), having lost its terminal -i by apocope; pálpalish shlapshaltko incorporates the adjective *white* into the verbal adjective "having flowers". This phrase may be circumscribed by pálpalish shlápsh gítko. Cf. 123, 6. and *Note*, and 150, 1.

146, 8. wí-ukayant kěládshamat. Here the adjective in its locative case, used attributively, is united with the partitive case of the substantive, the original form of both being wi-ukáyantat kěládshamti; the subjective case: wi-ukáni kěládsham.

146, 12. Kěnáwat or horse sorrel is mentioned in an Aíshish-myth and does not

*539 262 824 grow so tall in the cold Klamath highlands as in the Californian and Oregonian valleys adjoining them to the southwest and west, where its height attains sometimes three feet. Cf. *Note* to 94, 9.

192 [193] **146, 14. Klána**, an aquatic or tule-grass, of which they eat a portion of the young stalk. The term "tule," from Aztec *tolin*, serves in the West to designate all kinds of rushes, stalks, and grass-like plants growing in the water and wet grounds. By k̲ók̲ĕtat are meant the Williamson and the Sprague Rivers.

147, 1. Klápa is the name of the eatable bulb or root growing on the púdshak-plant. The púdshak-grass becomes red in the autumn, when dry.

147, 3. Ktû'ks is the eatable root of a species of the cat-tail plant; táletat, locative case of tálish (or tálesh?), straight stem, from táltali "forming a straight, unbroken line." The ktû'ks grows in the water, like the wild parsnip (skáwanks); the natives dry the tender roots of the ktû'ks and bake them into a sort of bread. The epithet: "like wókash" probably refers to the *taste* of this kind of food.

147, 5. Kû'ktu. This plant attains a length of about 6 inches.

147, 6. 7. K̲áls is the globular bulb of the witchpai water-plant.

147, 8. K̲ä's, k̲ä'sh. This plant produces a hard, whitish, farinaceous bulb, which is commonly spoken of as ípo, a Shasti term, and is one of the most important food-articles of the Oregonian Indians. To dig or collect k̲ä'sh: k̲ä'shala, k̲ä'shla.

[252] [825] **147, 9–13. K̲ō'l**, also pronounced k̲û'l, gû'l, gúl, is a kind of Aralia. The root is eaten only when roasted, and is then very nutritious, though spreading an abominable smell. This odor is so penetrating that, as alleged, the grizzly bear will attack nobody who smells after roasted k̲ōl; to this we may add the restriction: "if he is not very hungry." John D. Hunter mentions in his "Manners and Customs of Indians," etc. (Phila. 1823, page 370) that the Osages ascribe to the plant washoba-pesha the power of scaring away the black bear. This plant is an annual growth possessing sudorific and cathartic properties. Washobe is the black bear, mitchú the grizzly bear in that Southern Dakota dialect.

147, 9. hû'mtcha gû'l: "the k̲ōl in this condition," viz: in the ripe state. The k̲ōl-plant is ripe when the stalk becomes red or reddish.

[193] **147, 10. méya.** Speaking of *many* women digging bulbs or roots, atá-ila, atä'-ila is the regular form; its proper signification is: "to fill up" "to fill" (the conical root-basket worn on back, yáki).

147, 10. 11. pû'kguishamtat: "to their old roasting place"; púkuishamat might stand instead. The locative suffix -tat, -at is here appended to a verbal substantive of púka, to roast, standing in the possessive case -am, and -u- is the infix marking past tense. The guttural k has become distended into kg.

147, 12. ĕ'nt or ĕ'nd for énat, conditional of éna. Instead of ĕ'nt, ídshant (for ídshnat) may stand in the Klamath Lake dialect.

147, 14. Lupí' etc. The import of this sentence is: "L'bá ripens in the month when autumn begins."

[285] **148, 1. Má-i** is the common reed or tule-grass growing sometimes to the height of 8 to 10 feet. The shallow borders of the lakes in the headlands of Klamath River are full of this growth, which is one of the most important economical plants for the Indian. Women manufacture from it mats, dishes, baskets, lodge covers, nets, sacks, bags, and the young stalk yields in its lower part a palatable marrow.

*539 262 824 192 148, 2–4. Yánakänin for yanakänini; cf. suffix -ni, -nini in Dictionary. mä'nsh for mä'ntch. pä'shtak for páhasht ak, cf. pä'sht, 147, 17. for páhasht.

148, 5. Nú'tak. This grass belongs to the genus Glycerium, as identified by Dr. E. Foreman, and produces a tiny, grayish bright seed of tchípash size. The flowers are of a light red color. The grass is found around the agency buildings and grows about one foot high.

148, 7. Páwash properly means *tongue*.

148, 11. Pû'ks or *camass*. Its bulb is one of the principal food-articles of all the northwestern Indians, but does not grow in profusion in the warmer portions of California. It is of the magnitude of the walnut, very saccharine and nutritious, ripens in May and June, and by the roasting or baking process described in the text becomes as hard as stone. The Máklaks call it after pû'ka *to roast*, the Shasti name is sók, the Pit River name ähnalé, while the name kamas, "sweet," is of Nutka origin. The botanists call the plant Scilla or Camassia esculenta. Cf. *Note* to 146, 1.

148, 14. ípakt, metathesis of ípkat, the conditional of ípka to lie there, to remain.

[222] [462] [252] 148, 16. púlχuantch. The gathering of this pupa or chrysalid and of its caterpillar, the χeshî'sh, is chiefly done by the women of the tribes, who find them imbedded at no great depth in the sandy ground around pine trees. Another chrysalid, the kûlí'ga, is collected and roasted by them in the same way and tastes like eggs. kahû'n puetílank: putting grass under the chrysalids, not under the heated stones. The stones are replaced by other heated ones, as soon as they have cooled off; the larva assumes a black color after roasting and tastes like eggs. See púlχuantch in Dictionary.

[221] [222] [193] 148, 19. guiχakshî'mighta. The season of the year, when the exodus of the whole tribe to Klamath Marsh takes place, where pond-lily seed is collected for the winter, is about the middle of June. The ending -ta is an abbreviation of the case suffix -tat. Three seasons are stated in the text, when the peeling of the inner or fibre bark of small pine trees is performed; of these the camass-season precedes the exodus to Klamath Marsh by a few weeks only, and the fishing season lasts from February to the end of the summer. Of course, the peeling of the kápka-pine coincides with the season when the sap ascends through the young tree. The bark is removed from about five feet to fifteen or twenty feet above the ground, and most of the beautiful pines treated in this manner are doomed to premature decay, though many survive the operation. The aspect of a forest with some of the pine trees peeled is rather singular.

148, 21. shánks hak, contraction of shánkish hak or ak.

149, 1. ka-tánian for ka taniáni "so much in width or extent." The bud of the táksish has a width of about half an inch. Cf. *Note* to 146, 1.

149, 3. 4. tók. This aquatic grass grows about two feet high; by é-ushtat is meant, here and in tsi'kal: Upper Klamath Lake.

[194] 149, 3. pä'lpali, vocalic dissimilation of pélpali or pä'lpäli; cf. taktä'kli 149, 14.

149, 5. Tchí'psam is a prairie grass on which the brown tchípash-seed grows. This seed is extremely small, and it takes a long time before a sufficient quantity of it is [178] gathered to afford a meal for a family. Still smaller is the nútak-seed, and both are striking instances of the persistence of the Indians in keeping up their old mode of living, when by agriculture and stock-raising they could procure provisions with infinitely less trouble and in much shorter time.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 149, 6. tü'ksh is probably the adessive case of tóke (ŏ) fire-place, hearth: tók-kshi.

262 149, 12. Tchuá is the long, cylindric root of the Sagittaria sagittifolia, an aquatic
824 plant common in the West and East of the United States. In Oregon the term *potato*
● 192 or wápatu (Chinook jargon) is most commonly heard for it. The name of Chewaukan
Marsh, a sink and low ground situated east of Upper Klamath Lake, is a corruption
[193] of Tchuaχĕ'ni: "where the arrow-leaf is found." The flower of the wápatu varies
between red, reddish and whitish.

149, 17. Tsuni'ka. The flower has a diameter from two to three inches.

149, 21. Kû'lχamsh is put on strings by the women and thus serves to attract the fish.

149, 21. ptchi'nk: after this word ought to be seen the picture of a tiny vegetal cylinder, about one inch long and slightly curved.

[386] 150, 1. Skáwanks or wild parsnip, a poisonous plant growing in wet places to the height of three feet.

150, 8. p'nä'sh, contracted from p'nálash, is the direct object (reflective) of shkukluápkasht: to guard themselves against becoming chapped by sun-burns. The wákinsh seems to be a kind of resin and furnishes a red paint, as does also the k'lépki.

INCANTATION SONGS OF THE KLAMATH LAKE PEOPLE.

1. *Introductory song:*

Yä'ka ní, yä'ka ní, yä'ka ní *etc.* ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́
I sing, I sing, I sing (in chorus).

2. *Song, reference unknown:*

Wiwiwá! ní sháwalsh wítnank! ⏑ –́ | ⏑ ⏑ ⏑ –́ | –́ ⏑
Blown off! the plume-crest has disappeared from me!

3. *Song of the wind:*

Kanítala m'sh û shlewitaknû'la? ⏑ –́ | ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́ ⏑
népaksh a-i ní'sh shlewitaknû'la. ⏑ –́ | ⏑ – | ⏑ –́ | ⏑ –́ ⏑
Who, I wonder, is blowing out of my mouth?
The disease is emanating from my mouth.

4. *The conjurer's song:*

Tuá kí nû shatashtaknû'la? ⏑ –́ | ⏑ – | ⏑ –́ | ⏑ –́ | ⏑
nä'paks nû shatashtaknû'la. –́ | ⏑ – | ⏑ –́ | ⏑ –́ | ⏑
tuá kí' nû shatashtatχí'sh? ⏑ –́ | ⏑ – | ⏑ –́ | ⏑ –́
nä'paks nû shatashtatχí'sh. –́ | ⏑ – | ⏑ –́ | ⏑ –́
What do I remove from my mouth?
The disease I extract from my mouth.
What is the thing I take out?
It is the disease I am taking out.

*539 533 755 Many Indians do not understand all these songs, which contain many archaic forms and words, and the conjurers themselves are generally loth to give their meaning, even if they should understand them. Some songs are of a stereotypic application in the treatment of all or the majority of the maladies. A close familiarity with the habits of animals of the forest manifests itself throughout, as well as in the mythic tales.

*539 533 755 The translations added by me are not literal; they render the meaning of the songs in a free and paraphrastic manner. In the metrics the accentuated syllables designate a higher pitch of the singing voice.

● 192 153; 2. Literally: "I blew off the feather-crest."

153; 3. To read: shléwi witχnû'lank, seems preferable in this connection. Cf. 35.

[292] 154; 6. On grand occasions young women were in the habit of dressing in buckskin robes, fringed with porcupine quills (shmáyalsh). In a myth the bull-frog was reported to wear constantly this kind of dress, and hence originated a sort of proverbial locution: kó-e shmashmáyalti: "the bull-frog in the shmáyalsh-dress." Cf. shmáyam. Zoologists call this frog: Rana pipiens.

154; 7. This is called washpaláksam shui'sh, the medicine-song of the washpálaksfox species, Vulpes velox. The exterior of this fox may be sketched by the words: ă'kelă'kĕla wátchag hû'tchnuk, a long-bodied dog is running or trotting. Cf. song 22.

154; 9. This is called the tuákshem shuinō'tkish or incantation sung by the crane itself through the mouth of the conjurer. Nobody could hear the bird's voice if the conjurer did not sing its song. A song, which the conjurer sings for himself and by which he does not interpret any animal or other object of nature, is called kiúksam shui'sh and is endowed with magic powers. In the West of the United States the tuákish is popularly known as shitepoke, in the East as fly-up-the-creek.

[825] 154; 10. The feathers of the yellow hammer are worn on neck as an ornament.

[301] 154; 12. This refers to a certain large bird not specified, which contracts its body, so that the head seems to be its largest part. When walking, the bird seems to roll around on the prairie. Pílan for píla nû.

154; 14. The object to which song 14 refers is not known.

154; 15. Walχátchaga is very probably, though not certainly, a kind of marten. Mantles were made of its fur. This rimed incantation is called walχátchkalam shuinō'tkish.

155; 16. Called: tchá́shisham shuinō'tkish; melody very pretty. The diphthong ui is pronounced here as *one* syllable. Skunks, while running around, are in the habit of holding straight up their bushy tails, which are almost as long as their bodies.

155; 17. This pretty song is chanted by the choristers while the kiuks feigns to suck out of the body the tiny object which is supposed to have caused the disease, and before he gets it out. k̲óga, k̲ók̲a means originally *to bite;* bite first, then suck the disease out.

155; 18. Pápkash is pronounced almost like pávkash; 144, 11. k̲ópk̲a like k̲óvka.

155; 19. Alludes to a peculiar nodding observed in lizards when running out of their holes and stopping at the issue.

155; 20. The animal to which this song refers is not known. Compare No. 16. 24. The literal meaning is: "The north wind blows around me from the distance."

155; 21. This song, with a beautiful melody, is the shuinō'tkish of a mouse species with pig-like proboscis.

*539 155; 22. Pékah, lékah, distr. lélakah crazy, maddened, intoxicated. This song is
533 sung also: lē-é'kah, lē-é'kah gená: ⏑ –́ | ⏑ –́ | ⏑ ⏑́ Cf. 154; 7.

755 155; 23. The weasel is squealing, because hunters have caught or trapped it.

● 192 156; 26. Probably refers to one of those birds to whom the power is attributed to bring about storms, fog, snow, or any change of the weather.

156; 27. Compare songs 2 and 3.

156; 28. This bug, perhaps a scarabee, bites the skin to suck out the disease from the wound.

156; 30. This is probably a song of the wind, not of the young silver-fox (as I was told), and I have translated it as such. The song No. 20 is analogous to it in every respect; the winds, which the Indians constantly compare with the spread of the disease, are frequently mentioned in these songs as blowing upon some animal or other object sent out by the conjurer to discover the whereabouts of the disease. Cf. No. 16. 20. 24. 25. 29. 30. 43. and 57.

156; 32. This song is said to allude to the circumstance that one fox's howl seems to sound like the cries of many foxes howling together. Lalálash are both sides of one and the same beast.

156; 33. With these monotonous sounds the tuákash or tuákish calls itself by its own cry: tuák, wák, tuák. Tuány̧i is: tuák ni gi "tuák I am crying." Cf. 154; 9. Two refrains to this line are formed by the two lines of No. 34.

156; 35. The *personified* disease spreads the germs of sickness through the atmosphere. This song is comparable to songs 3 and 45.

157; 37. The signification of h'îlantana could not be disclosed, but it seems to be similar to that of tîlantana.

157; 39. This small bird is dark, and has a red or yellow neck.

157; 43. Speaks of a fog drifting away from the mountains and turning into a cloud, which is drifting also.

157; 44. The bones of a dead person's skeleton are supposed to rattle against each other, the spirit being here identified with the skeleton.

157; 46. Often sung wélwashi gi; epenthetic syllables are frequent in these songs, *e. g.* walχátchika in song 15.

157; 47. The wáměnigsh or wámn'aks, a species of Pityophis, has large black spots and frequently occurs in the Klamath country. Tunulúla means to hang down over something as over a rock.

158; 48. This is sung when water is poured over the patient. A more literal translation would be: "I am resounding within the ground."

[823] 158; 50. Yaínalam shulúyualsh means round, cylindric or globiform objects standing in a row on a mountain. The den of the grizzly bear is supposed to be in the mountains or on a mountain top. Cf. song 36. My informants did not know what the objects were which stood in a series, but if any religious notions were connected with them, we may compare the three sacred rocks standing on a mountain top in Peruvian mythology. These rocks were fetishes indicative of stone worship, representing a mother with two sons. Another myth mentions four of them, representing Catequil (the god of thunder), Viracocha, a sun god and a fire god. The song No. 50 is sung by the chorus while the kíuks is dancing.

*539
533
755

8. *Song of the quiver:*

Yáhiash nû tadsí tadsí ⊥ ⏑ ⏑ | ⊥ ⏑ | – ⏑ | ⊥

9. *Song by a companion of the old frog:*

Kú-e welékash nû wélwash tchalekíya ⏑ ⊥ | ⏑ ⊥ | ⏑ ⏑ ⏑ ⊥ | ⏑ ⊥ ⏑ ⏑

An old frog-woman I sit down at the spring.

10. *Song of the gáwi-bird:*

Sháwalish haí nû shlataníya ⊥ ⏑ ⏑ | ⊥ ⏑ – ⏑ | ⊥ ⏑

A flint-headed arrow I am ready to dispatch.

11. *Song of the eagle-feather:*

Mû'kash a gí nû, gená nû, hō ⊥ ⏑ | ⏑ ⏑ ⊥ | ⏑ ⊥ | ⏑ ⊥

I am the eagle-feather, I am going down, hō!

12. *Song, reference unknown:*

K̲ú-i hai nen ksíul'ka

I feel too bad for dancing.

13. *Song of the dwarf:*

Na'hnías naní naní naní-a a á nanía . . . . . . naní, naní-i-ā

14. *Song, reference unknown:*

Käíla nû spí'amna ⊥ ⏑ ⏑ | ⊥ ⏑ ⏑

I am dragging out dirt.

15. *Song, reference unknown:*

Sháppashti nû lak̲í gí

I am the lord of the sun.

16. *Song of the shaiχish-bird:*

Shaiχí'sh gúluaga lulamnóla ⏑ ⊥ | ⏑ ⏑ ⊥ | ⏑ ⊥ | ⏑ ⊥ | ⏑

I the little black female bird am lost and strayed.

NOTES.

*539

755
● 192

162; 1. By others this song was given as follows: Nī'paks kinuína k̲alowát nû: "I the disease am meandering through the skies." This variant is evidently preferable to the one above.

162; 2. In the Sahaptin language of the Yákima, Washington Territory, a certain bird is called piúpiu; the Klamath Lakes call a spotted kind of woodpecker shpíu'hpush. Both terms are derived from an onomatopoetic radix piu, imitating the picking at the bark by the woodpecker.

162; 3. The túktuknash or fish-hawk, Pandiou carolinensis, occurs in large numbers on the lakes of the Klamath highlands. Like that of many other birds, its Indian name is derived onomatopoetically from its cry.

* 539 533 755 ● 192 [825]

163; 4. Of the yaúχal, white-headed or bald eagle, Haliaetus leucocephalus, another conjurer's song was obtained. Cf. 165; 5.

163; 5. The wording of this song could not be obtained with certainty.

163; 6. Stands for: ati tchelä'wash nû géna.

163; 7. té-i, té-i has no meaning, but simply serves to beat the measure when dancing with short steps.

163; 8. This song is said to be that of the quiver (tóksaksh) and its purport the same as that of No. 7. Yáhiash is a kind of aquatic bird.

163; 9. A similarly worded song is in the Modoc collection, given by Toby Riddle.

163; 10. Sháwalsh is here lengthened into sháwallsh for metrical reasons.

163; 11. This is a favorite song of a kíuks on the Williamson River, called Skúkum Doctor (stout doctor). Given by Dave Hill, also 12 and 13.

[772] 163; 13. Foot-prints not larger than those of a baby are sometimes discovered in the higher mountains of the Cascade Range. The Indians refer them to a dwarf called ná'hnias, whose body can be seen by the conjurers of the tribe only. The dwarf gives them his advice for curing the sicknesses of others and inspires them with a superior kind of knowledge.

163; 14–16 were dictated by an Indian whom I found at Linkville.

163; 15. The name of the animal, probably a bird, to which this conjurer's song refers was not obtained. Cf. shápsam ptchíwip in Dictionary.

E-UKSHIKÍSHAM KÍUKSAM SHUÍ'SH.

* 539 533 755 [115]

INCANTATIONS OF THE KLAMATH LAKE CONJURERS.

OBTAINED FROM "SERGEANT" MORGAN.

1. *Song of the Lake:*

Ktaálui gé-u é-ush

My lake is glittering in azure colors.

2. *Song of the rain-storm:*

Gé-u a-i népaks népka,
gûlkásh gé-u hû shuísh.

The disease produced by me has arrived,
I am the storm and wind and this is my song.

3. *Song of the conjurer's arrow:*

Gé-u a hû't hănă'sish

This here is my long magic arrow.

4. *Song of the North wind:*

Yámsam gé-u gē'-ish kápa –́ ⏑ – ⏑ | –́ ⏑ – ⏑

I am the North wind, and in my path I am irresistible.

*539
533
755

70. *Song of the little wipĕlī'wash forest-bird:*

Wipĕlī'wash nû shuí'sh gi,
wuipléwĕsh nû shuí'sh.

My own song I sing, I the wipĕlíwash-bird.
I the wuipléwash am singing about myself.

71. *Song of the witkatkish-hawk:*

Gé-u aí hû tû' sáwals, –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑
witkatkísam gé-u sáwals. –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

My head-crest this is, it is that of the witkatkish-hawk.

NOTES.

[825] The incantations obtained from Morgan are mostly of the kind called shuinō'tkish, and a large number of them are attributed to birds. Some of them probably exist in a more explicit form, which was not remembered, and the rhythmic or musical form was obtained of a part of them only. A literal translation of these song-lines is an impossibility in most instances, if their sense has to be rendered in full; I have therefore furnished only paraphrastic interpretations. The list is alphabetic, and was arranged after the names of the animals, or other personified objects, to which the incantations are attributed. Many of these songs are referred to in the "Subject List of Incantations" given by Morgan.

*539
533
755
192

164; 1. Ktsálui, to be resplendent with colors, is mainly said of objects showing a blue or purple tinge: pû'ksam shláps ktsáluitko, the camass-plant has a bluish color. This verb is also used when speaking of the rainbow; of the lizard: 165; 14., also of the weasel's fur-skin; 169; 55.

[772] 164; 3. The use of these conjurer's arrows is mentioned 73, 5.

164; 4. Yámsam for Yámasham; cf. *Note* to 111, 4. Of the personified North wind the Indians say "he lives up in the mountains". On the north side the basin of [193] the Williamson River is closed up by high mountains. Gé-ish and génuish, génhuish means the action of going and that of having gone, or the present and the past going; both were translated by "*gait*", "*tread*", a term which does not differ much from the real meaning. Both terms also occur in the songs obtained from "Doctor" John, and are mainly used of quadrupeds, amphibians, and reptiles.

164; 4. kápa probably for gátpa (nû), "I have come".

[136] 165; 6. The yĕ'n sucker-fish is quite abundant in the lakes of the Klamath highlands and has been identified by Prof. E. D. Cope as the Catostomus labiatus.

165; 7. yéwa. In Morgan's series of incantations there are song-lines on wind-gusts, tempests, rain-storms and on the winds blowing from each of the four cardinal points of the compass. These latter are not positively stated to be producers of dis- [821] ease, though they are dreaded on account of their force and violence. The East wind (yéwash) blowing over the alkaline or volcanic, arid lands of Southern Oregon sings: yéwa, yéwa (nû) which does not only signify "I blow from the East", but also "I am howling".

165; 11. Feigning to draw a rope or string from their own posteriors is a trick sometimes resorted to by doctoring practitioners to make a disease disappear.

*539
533
755

165; 13. It is by no means certain whether the above is the full wording of this song or not.

192 165; 16. nen involves the idea: "you hear it yourselves." Cf. 167; 36. 170; 59.

[534] 166; 17. kódsinksh was in this connection explained by lílhanksam stĕ'ksh. Conjurers' rattles are made of deer's claws.

166; 18. This hawk is a kind of sparrow-hawk, Falco sparverius.

166; 20. Compare the song of the weíwash-goose: 170; 60.

166; 21. This song of a female conjurer or "doctress" is quite analogous to the song 166; 17.

166; 22. The ḳála flies around in cold nights followed often by foggy mornings, hence the belief that it makes the fog.

166; 25. Compare the gray wolf's song, 165; 12., which forms alliteration to this.

166; 26. Refers very probably to the cremation of the dead.

[778] 167; 30. In line 2 the same object is alluded to as in line 3, kóltam sχī'l. This is a broad strip of dressed otter skin, ornamented in various ways with shells, feathers, bird-scalps, etc. To all these objects a magic power is attributed severally, and as they are now all united on one strip of skin, this strip must unite the magic powers of them all. The conjurer suspends the sχī'l on his neck and lets it dangle over his chest or back, according to the manipulations in which he is engaged at the time. It is considered as one of the most powerful of all the curing tools or múluash.

167; 32. Alludes to the grayish-white color of this bird, which burrows underground. This bird is also mentioned in 154; 12. and *Note;* cf. also 132, 7. 8.

[193] 168; 41. Sχī'pa is the abbreviated form of the possessive case in -am, as in wásha wéka 105, 9. and *Note* to 105, 7.; in: nī'l wéksa, 144, 1. cf. 165; 13.

168; 44. Interpreted by others: "I am scolding and threatening the earth".

169; 50. Another túktukuash-song is contained in 162; 3. cf. *Note.*

169; 52. Shaíkish is another name given to the tchákiuks.

169; 54. The kingfisher or Ceryle alcyon is called in Klamath Lake tchántchan, tsántsan, tchánshan after its cry: tchătchătchă, and chiefly feeds on salmon.

169; 56. The second line was referred by "Sergeant" Morgan to the otter. Cf. 177; 13.

170; 58. This alludes to the name of the bird, which imitates its twittering.

170; 62. This bird circles in the air to discover fish on the lake's surface and to pounce upon them. The tchuaísh is the red headed vulture or black buzzard: Cathartes aura. The Indian name is an imitation of the bird's cry.

170; 63. 64. The wákash-crane is identical with the tuákish, the name being derived from its cry. These birds creep along the edge of the water in search of small fish. Compare the tuákish-songs 154; 9. 156; 33. 34.

170; 65. This song is much better expressed in the series of Modoc incantations: 174; 13. Here as well as there alliteration is perceptible.

[193] 170; 67. After gé-u, the subject of the sentence, nä'paks or the disease, is omitted. In the name of the duck the final -s, -sh is geminated here in the possessive case, to stand for wa-u'htū'asam.

[194] 170; 68. In the onomatopoetic word wä'ks the dissimilation of the vowel into wä'-aks is frequently observed. Also pronounced wékash.

170; 69. The weíwash- or waíwash-goose is a long-necked white bird, commonly known as snow-goose: Anser hyperboreus.

*539
533

Kú'tcha-aga. Wínua nû a kû'tsag, shéshatk kû'tsag; pákish wák kû'tsag.
Wekétash. Nû ai weketásh gi; wéketa nû shahualtámpka, nû shahualtámpka, nû wekétash shéwa.
Mánk̲aga. Ná-asht shä'shatk, mánk̲ag shä'shatk.
Kaknólsh. Gä' a gé-u káknûlsh, gé-u hût káknûlsh; nû shlä-ípēle káknulsh, p'laiwash káknulsh.
Pápkash. Pápkash wálta gé-u a gé-ish; wálta gé-u gé-ish pápksham lû'lp; k̲ä'gi gé-u pápkash gé-ish.
Spú'klish. Nû ai spû'klish, ná-asht shä'shatk.
Shläkótkish. Gé-u a shläkō'tksh, gä' ki hû shlakō'tkish; wudsi'tsi ánku, túm udsí'tsi; túm í'lχi, túmi ánku, túmi gé-u ánku gi.
Pä'ksh. Shuí'sham gé-u pä'ksh; kátchgal gé-u shuí'sh.
Welékag. Nû ai welä'kag; nû a tchía welä'χatkank; gē'k a lû'lp, gē'k a múmuatch.

NOTES.

The majority of these songs are destitute of any interesting and characteristic features, and being of easy interpretation I gave them without translation, adding, however, the necessary remarks in the Dictionary. These phrases are common-place repetitions of some shamanic ideas current in the tribe, and are given in a low jargon or technical slang redundant in elisions and contractions. Only a few of their number are rhythmical. The pronoun nû, I, is often repeated three times in one sentence, in the form of ni, nû, an (a nû), ank (a nû gi), na (nû a). [193]

*539
533
192

Of the thirty-seven objects which have given origin to these songs sixteen do not occur in the shamanic songs given by other informants and two are given here under other headings: the *sky*, paíshash (under kálo), and the *marten*, Skélamtch (under pē'p). I have arranged all the songs in categories of natural objects.

[825]

K̲ák̲ash also furnished a series of limbs and organs of certain animals which were supposed to exercise supernatural powers, and therefore were made the subject of a shuí'sh, shuinótkish, or incantation. They are as follows: of the *black bear*, the head, snout, paws, fur and heart; of the *dog*, the head, hair, fur, ears, tail and paws; of the *weasel* (tcháshgai), the head, eyes, snout, nose, chin, long hair, paws and tail; of the *mink*, the paws, snout, fur, tail and heart; of the *shaé-ish-duck*, the head and legs; of the *salmon*, the head and fins; of the *fly*, the wings (lás, black or white) and legs. About the *young antelope* and *old woman's spirit* (wí'hag and welékaga) see below.

176; 2. wítsa. When the clear sky is said to blow with a shrill sound (wítsa), and thus "to sing its own song", this means that the winds are blowing fiercely through the air, high above the ground.

176; 3. This song on the grumbling or rattling earth (wálta, huálta) was made by Doctor John on the subject of his own imprisonment, the cause of which I have related elsewhere.

176; 4. Sháshapsh, Sháshapamtch is the mythologic name of the grizzly bear: 118, 1.

*539 533 192 [194] 177; 2. "There are two of us black bear cubs" refers to the circumstance that in mythologic tales two cubs only are found to belong to one bear family. Compare what is said of the gíwash, 177; 14. and *Note* to 118, 1. 7.

177; 5. The name of the young antelope is very differently pronounced. Its ears (mumû'atch wil'hágam) form the subject of a shuí'sh.

177; 13. Koyóma. The same idea is met with in 169; 56. 166; 24.

177; 14. gíwash (the *i* pronounced short) is the long, gray-colored squirrel.

178; 7. Pápkash. This song of the lumber-boards was more completely remembered than the one quoted 155; 18.

178; 12. Pä'ksh. A similar tobacco-pipe song is to be found 167; 33.

[754] 178; 13. welékag. Here as well as in all other portions of the globe the idea of sorcery and witchery is associated with that of old women (welékash, old woman; welekága old woman's spirit). Welä'χatka, to travel around or appear as an old woman's spirit.

NÁNUKTUA KIÚKSAM SHUÍ'SH.

Lû'bak̲s, k̲lépki kiúk̲sam shuí'sh, tsé-usam skû'tatk, tsé-usam tsúyätk,
White chalk. red paint are doctors' songs, tchê-ush-dressed, tchê-ush-head-covered,
tsé-usam lā'sh, witkakísham lā's.
tchê-ush-feather, hawk's feather.

Kat'sitsutsuéas kiúksam shuísh, kat'hiáwash, lû'luks-skû'tchaltk,
Snow-flake witchcraft is a doctor's song, hair-tying, in fire-robed,
skû'ksam hä'kskish, hä'näsish.
spirit's walking-staff, conjurer's arrow.

NOTES.

[124] All these subjects of tamánuash songs were obtained pell-mell and jotted down in a confusion. A clear insight into the quality of the songs known to this Indian could be attained only by classifying them into categories, as those of natural agencies, the winds, rocks, genera of animals, plants, tools and articles of native dress. Morgan had heard all these songs sung in former years, but when I met him he could remember the texts of those 71 songs only, which are to be found from page 164 to page 171. Many songs of this subject list are sung by the Modoc conjurers also.

*539
533
192

Certain names of uncommon species of animals could not be rendered in English for want of information; to others the Dictionary will afford the best clue.

[193]
[866]
179; 4. káwam or k̲áwam is a possessive case, requiring as its complement ámpû or k̲ók̲e, kok̲eága. To bathe in eel-springs is deemed to be of great influence on character and personal courage, for the constant peril of being bitten by crabs, snakes and other reptiles must necessarily make the bathers scornful against sudden pains.

179; 6. tsû'χatχant, or in its full form: tsûχatχántko, has to be connected attributively with the foregoing word: taákiag tsû'χatχantko "a restless boy, a little boy unable to keep quiet on his seat."

[193] 180; 1. taaskáya wéash, kólta wéas show the apocopated form of the possessive before a vocalic sound. This is another example of the rule that Klamath seeks rather than avoids *hiatus*. Cf. stsá-usa-wálks 168; 45; 180; 23, and *Note* to 168; 41.

180; 5. spû'm; said to be the female of the fat shkä'-bird. There exist conjurers' songs about both, which I have given in this volume, page 167; 36. 168; 44.

180; 10. póp-tchikash seems to mean the "drinking *or* sipping bird" (cf. pópo-i).

180; 17. Lä-a-ámbotkish, "the one which refuses to drink" seems to be a newt, Amblystoma, according to the description given of it by the Indians.

180; 17. kóä. The toad or bull-frog tamánuash song is reputed to be the most efficient of all these incantations.

180; 18. Ámpuam lák is a film-like organism moving rapidly in spirals or meanders through the water, and supposed by rustics to originate from the long hair of horses. The primary signification of ámbutka, to be thirsty, is "to return to the water", and the distributive form a-ámbutka here indicates repetition.

180; 19. The list *of plants* is very small when compared to that of the animals, and embodies economical plants only.

180; 22. wásh means *place of residence* in general; but since all the objects in this category refer to the sweat-house, it may be referred to a removal of earth in the floor of this structure; lúloks is the fire burning in the centre of it.

181; 1. tsé-usam skû'tatk: "dressed with feathers of the yellow hammer or red shafted flicker."

NOTES.

*539 533 832 I. Erotic songs obtained from Chief Johnson, Minnie Froben, and others, in the Klamath Lake dialect. The twelve songs obtained from Minnie Froben are among the prettiest and most melodious, as for instance 9. 16. 17. 18. 25. 26., and the eighteen songs dictated by Johnson are of importance for the study of manners and customs, viz: 6. 7. 8. 10. 11. 19. 20. 28. 29. 41. 42. 43 etc.

With the Indians all of these and many other erotic songs pass under the name of *pilpil* or puberty songs. They include lines on signs of womanhood, courting, love sentiments, disappointments in love, marriage fees paid to parents, on marrying and on conjugal life. Some love songs have quite pretty melodies. A few songs of the present interesting series of song-lines seem to treat of commonplace subjects only, as 22. to 24.; 28. to 31., while others apparently contain nothing but heartless mockeries and satiric strictures, like 9. 28. 40. 44. But they all refer in fact to love-making and kindred sentiments, the satiric lines confirming the proverbial inclination of lovers to fight among themselves. I have deemed appropriate to gather all these songs under a heading which unmistakably expresses their real purport. *539 533 832 192

194 182; 1. The accent is laid sometimes on first, sometimes on second syllable. This word is abbreviated from yuyulinĕ'pka, as it occurs in the Modoc pilpil song. The event mentioned here is followed by a dance-feast; cf. shúyuχalsh, and 134, 21.

182; 4. ginhiéna "inside" means into a secluded spot, lodge or enclosure. O-ólka, ó'laka is the diminutive of ó'lsh, the grayish pigeon with the plaintive voice.

182; 7. gítknapka, a contraction of gítko gi-uápka 1.

583 182; 8. Pay a wedding gift is equivalent to purchasing a girl from her parents for a handsome consideration.

193 182; 11. Sung by women. The original as given to me does not contain the negative particle: Géntala nû haíkanka púshpushlish hishuákshash.

183; 12. yan'wán 1 stands for yanhuáni 1.

183; 13. kalí'napka: they are not only "dead but out of sight", as the suffix -apka indicates. This being an erotic song-line, kalínapka simply means that the females looked for are either asleep or absent, and not deceased, as kalína would seem to indicate. 'mutchéwatk for kĕmutchéwatko; cf. 136, 5.

183; 14. 15. These two songs follow a purely anapæstic metre, No. 15 adding two acatalectic syllables to its three anapæsts. Compare also the first line of 182; 7. with one supernumérary syllable. As for the contents of 183; 15. compare the analogous Modoc song 186; 51.

194 183; 17. Melody very engaging. In lúluash the second *u* is redoubled for metrical reasons. Dactylic rhythm prevails here, in 16, and in 182; 11.

183; 18. That is, while he was seeking young girls inside the kayátas. Melody very beautiful.

193 183; 19. wayósham, possessive case of waíwash, *q. v.*

183; 20. shkutántki stands for skútatko gî or shkutanátko gî: "he is wrapped in."

183; 21. The much more so, because he is in his festive garb, the pútash and lás stuck on his headdress.

184; 26. Melody very pretty. A young woman addresses these words to a lover.

184; 27. Sung by young women who have fallen out with their beaux.

*539 184; 28. Said to be an erotic song.

533 184; 29. luyä'nitki contracted from luyä'nitko gi. Cf. *Note* to 183; 20.

832 184; 30. ḳóḳtkinshkink. The proper meaning of this verb is "to set upon like a
192 dragon-fly". Shanáhual is an uncommon form for shanahō'li, the long ō being resolved
[193] into its component sounds. Cf. náwal, and 184; 35.: genuála for genō'la.

184; 31. Why did the wolf howl? The reason given is that he could not meet anybody. This wolf is a loving young man who was looking out for women.

184; 32. Sung by one woman and repeated by a female chorus. This song-line treats of the abandonment of a female by her husband or lover for some reason.

184; 33. Pretty melody. The song refers to a lover disappointed in his affections.

184; 33. tchíkla wátsatka is preferable to and more frequent than wátsat, wátchtat, cf. 183; 22. Alliteration is perceptible in this song-line.

184; 34. The wásh is the lover of the girl who sings this song; the lover is compared to a prairie-wolf on account of his importunity and lack of moderation. Comparisons of lovers with quadrupeds and birds are frequently met with.

184; 35. yóshinko for yó-ishiank ō, yó-ishink hû: he is running astray.

[193] 184; 37. shiwága. In the objective case sometimes inflected like snáwedsh *woman* 80, 11. sometimes as a diminutive noun, as here, and 33, 10. In 185; 40. shiwákshash stands incorrectly for shiwágash, through phonetic analogy with shíwamptchash in the same song

185; 30 to 44, perhaps including 45, have a literal and direct meaning, and besides this are intended to convey an indirect meaning, which is of an obscene character. The same may be said of songs 15 and 51.

185; 41. This melodious song alludes to the habit of mud-hens to rest and sprawl on the top of the waves; wílhaslasna depicts their motions while on the wave-top,
[194] willaslína the sprawling observed while they sail down from it. With slight phonetic variations, this same melody is also sung as follows: Tóhosh ō willaslin; wíllaslasna, willaslína; wíllasli ln.

185; 42. wí'l seems connected with the diminutive word wíl'haga, *young deer*.

[193] 185; 43. kí' nak ĕn gí', stands for gí' nak, nen gi: "he cries nak, so he cries"; assuming that ĕn is abbreviated from nen.

185; 45. This is a "dream" song.

185; 46. Pilpil song worded in another than the Máḳlaks language.

000 II. Erotic songs obtained from Toby Riddle and J. C. D. Riddle in the Modoc dialect. The Modoc pilpil songs obtained are all of a satiric character.

185; 47. See Klamath Lake pilpil songs 182; 1.

185; 48. See Klamath Lake collection of pilpil songs 182; 2.

186; 49. Pilpil tune sung by girls. Taína is equivalent to t'éna, teiniwá-ash etc.

186; 50. A song repeated for hours by young Modocs; it is of the true pilpil kind.

186; 51. Originally a pilpil song, but sung now by children playing hide and seek.

186; 52. This is a very popular and prettily tuned Modoc song.

186; 53. Sung by Modoc girls who feel themselves importuned by their lovers. Often the boys join them by singing it in chorus. This well-meant advice of sending the boys to the South, no doubt to the Pit River country, is to keep them at a distance, for the song refers to the appearance of the first signs of puberty. Watchágalam is full form of watchágam, for which wátcham is sometimes incorrectly substituted.

*539 also pass as puberty songs, but I have preferred to class these under the heading of
533 songs of satire. Some are sung with melodies, others are spoken and recited only.

522 I. Satiric songs obtained in the Klamath Lake dialect from Chief Johnson, Minnie Froben and others.

[193] 189; 1. ú'yank. In this term the prefix u- gives the shape in which the tobacco was given away.

189; 2. Refers to somebody going to the Dalles or other place along the Columbia River. Cf. page 93, *Note*.

[192 193] 189; 3. In this verse there are four particles pointing either to distance or to elevation (altitude): tû'sh, hu, the -u suffixed to nen (nen hu) and to tchflamna. This song is sung by a woman, who hears (nen) for the first time of this assembling of geese; shésha waíwash stands for shéshash waíwash, or shéshatko waíwash: birds called waíwash-geese.

189; 5. A young woman is the object of this song-line.

[237] 189; 6. Woodpecker-scalps of shining colors are still in use for ornamenting various articles of dress, implements, &c. u'hlutuína: he flaunts it and parades in it.

[192 193] 189; 7. Ká tal? who then? who after all? abbreviated from kaní tala. Dresses made of walχátchka-skins passed for the poorest and meanest of all garments.

[291] 190; 9. This is sung by men only.

190; 13. A satire on feminine voracity. Sung by Klamath women from Klamath Marsh. Cf. below, 190; 21.

190; 12. haktchámpesh; -pesh is the suffix ptchi phonetically altered, the word introducing a comparison of the "striding one" with the young klítish-crane in the same song. A sarcasm on a long-legged person with swinging gait.

190; 16. Regularly worded, this proverb-like verse would read as follows: Kă'-utchish gû'lu wō'n=lákiash shamĕnakía.

000 II. Satiric songs obtained in the Modoc dialect from Toby Riddle and J. C. D. Riddle.

190; 18. A tatler has received the deserved bodily punishment for his gossip-tales. Of the first word no grammatic analysis could be obtained in either tribe.

190; 19. The business of gathering edible roots devolves exclusively on women, but here an old man, Bin, who still lives among the Modoc at Yáneks, is indulging in this useful pastime. That 's where the point of the satire lies. Hlívash is a word unknown to the Klamath Lake people in the signification of "basket".

190; 20. Sung by the national deity when foiled in the attempt of killing five lynxes by throwing stones at them; repeated from the shashapkĕléash, page 126, 3. Cf. *Note*.

190; 21. To be found in another version among the Klamath Lake songs; there it refers to a female living on Klamath Marsh, not on Klamath Lake.

190; 22. This tune was with many similar ones improvised by the Modocs, who visited the East a short time after the Modoc war, on seeing crowds of blacks filling the streets. All Indians feel *at first* a peculiar very strong aversion against the Ethiopian race, though subsequently they often become friends and intermarry.

*539 10. Aíshish kaí nû sha-ûlō'la, –́ ⏑ | –́ ⏑ – – | –́ ⏑
533 yuhanéash kaí nû sha-ûlō'la. – ⏑ | –́ ⏑ | –́ ⏑ – – ⏑ | –́ ⏑
171

I Aíshish I shall brandish, I shall brandish my huge sword.

11. Aíshishash hûn gáldshui, –́ ⏑ ⏑ | ⏑ –́ ⏑
hû' mish hû' shnekshituápka. –́ ⏑ ⏑ | – ⏑ ⏑ –́ | ⏑

Go to meet Aíshish; he will save you.

12. Tídsh hûn liulekán tchiálash shakatchóāla!

Halloo! let us form a circle and screen the salmon against sun-heat!

13. Kilidshi'ga shépolamna –́ ⏑ – ⏑ | –́ ⏑ – ⏑

They carry long-necked ducks on their backs.

14. Kaukátsi Yaína wō'n a shû-û'dshant i! –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

Follow up the elk and chase him upon Kaukátsi Mountain!

NOTES.

The first eight songs are worded in the Klamath Lake dialect, the third is of a mythic character. Songs 7–12 are worded in Modoc; 8 and 9 are K'mukámtchiksh songs. A few songs or fragments of such, which would come nearest to what we call nursery or Mother Goose's songs, will be found in the Myth of the Bear and the Antelope: 120, 11. 12. 13. 121, 9. 17. 122, 12. 13.

192; 1. This song is sung by women only, and seems to point to an ancient invasion of the country by tribes from the North or from Columbia River.

825 192; 2. The owl's cry is of fatal augury.

821 192; 3. Girls' song. When at sunrise a haze or fog extends over the country, this
192 is supposed to be a sign of the Earth's wrath against men.

192; 5. ki'pash is no word at all, but seems to stand for gitko-ptchi.

192; 7. The Indians were reticent about the meaning of this song, and hence I presumed that ō'k was intended to mean some deceased person, since these are spoken of as hû'k, *he*, *she*. Then the sense would be: "Be silent! that dead squaw is arising to sing a loud song." One Indian informed me that ō'ksta meant a squaw, and pronounced it ō'ksht (húnkisht?). Cf. *Note* to 35, 8 and page 130, second *Note*.

192 192; 8. These trochaic verses are called the K'mukámtchiksh-song, and a variant,
193 tuálam, exists for kánam. The alliteration of the k's and n's is very conspicuous. The meaning was given as follows: "I the omnipotent and unseen ruler of the universe will chastise and turn it over for the manifold crimes committed in it by Indians and men of other races."

192; 9. This is another K'múkamtch-song, in which he menaces to destroy the world for its misdoings. I have put the first line in quotation marks, because it forms the words or text of the song. The first line is sung about a dozen times before the second is sung once.

193; 10. Christian song, referring to the day of last judgment. Aíshish, who is a deity representing the powers of nature with animal attributes, has been in the mind of some Modocs identified with Jesus.

(41) So they looked. (42) And they just kept quiet.

(43) Now then Bear prepared food. (44) "Come and eat! Come and eat!" 539*
(45) Then the little one [of Antelope's children] said, "It tastes like Mommy's milk."[2] (46) Then the biggest one nudged him, saying, "Careful!" (47) Then he secretly put it aside. (48) Because she ate quickly, Old Bear did not see. (49) And she thought they ate a lot.

(50) The biggest one did not sleep all night. (51) When the little one cried, he said, "Don't! Don't! Maybe she'll kill us next."

(52) Thus, the next day she said goodbye to them all. (53) Having said goodbye to them, she said [to Antelope's children], "Go over there and play!" (54) Then she advised her own little children, "Don't play anything now, or perhaps they will do something to you. (55) Don't play leap-frog![3] (56) Don't swim around! (57) Don't race! (58) Don't play jump! (59) Don't play anything!" (60) But she forgot one.

(61) So the little fawns said, "Let's play something![4] (62) Let's play something! (63) Swim-racing?" (64) "No!" [said the little bears]. (65) "You name something then!" (66) "We don't want to play." (67) "Let us play leap-frong!" (68) "No." (69) "Let us race!" (70) "No." (71) "Let us wrestle!" (72) "No." (73) "Then let us play 'Two-in-smother'!"[5] (74) "Yes, yes, yes!"

(75) Then they first closed up everything, of that house. (76) Then they filled it up with smoke. (77) Then they said, "We'll do it first." (78) And they will do thus, "Two-in-smother, two-in-smother! Smother! Smother!" (79) Now they opened the door; they ran out. (80) "You next!" (81) So they ran inside. (82) "Two-in-smother, two-in-smother, smother, smother!"

---

[2] /ḱisi·bam ʔeči·s sitk ḿa·sʔa/ "It tastes like Mommy's milk" is baby-talk. Normal Klamath would be: /ṕkisam ʔečas sitk ḿa·sʔa/. The baby Antelope is here shown retaining the affix which occurs with kinship terms in their nominative form: /ṕkisap/ "mother." [195] [193]

[3] ‖sgntaŀygie·'wabg‖ : /sangaŀi·gye·waph/ "will jump over one another for sport." ((sg) 2pv "reflexive-reciprocal"; (ngaŀ) 45-v "to jump"; (oygi) 10sv "over, above"; (e·') 12sv "in sport, play, competition"; (wabg) 23sv "future"). This word has a closely similar meaning to ‖sgho·dwlye·gwabg‖ : /scho·wwalye·gwaph/ "will jump over each other," but this latter item seems to refer to jumping contests. [192] [196]

[4] /wiwʔa·ŀa·k/ "little fawns" is irregular. ‖rewiŀe'a·k‖ should : */wiwiŀeʔa·k/. (wiŀe) "fawn" must be stated as having an allomorph ‖wiʔa·l‖ only with (re) and followed by ('a·k). Otherwise ‖wiŀe‖ occurs. [193]

[5] This was Mrs. Ohles' own idea for a translation of /laplap ṗoŀe·/: "Two-in-smother." /laplap/ seems to be a distortion of (la·b) "two" plus (rdr). (ṗoŀ) 78v "to be out of breath, smother" occurs as a regular verb, but not with any affix /e·/, unless this be an otherwise non-occurring allomorph of (e·') 12sv "to do in sport, competition." [193]

#539 (132) čoy mis ni galamnbagwapk." (133) čoy sa honk ʔat glewi·ča wiće·ḿaḿčas qtampks hi·t hak.

(109) čoy honk naʔas, "q̇ay dak sa dwa· waq gi." (But she'd be scared, all the time, you know. She knew that little girl would cut off her mother's head when she came out of water at night, and she was afraid she'd find it in there with the fish.

---

[201] [124] [19] The little girl shot the sun in the cheek. Mrs. Ohles gestured to her own cheek here to clarify this, and /ho·t gida gwena, dalč́iʔam/ "it made a mark right here, of the arrow" refers to her gesture. She later remarked that the black spot is still to be seen on the sun's "cheek" and suggested it might be an Indian explanation of sunspots.

[192] [124] [20] The utterance /gočgočgočgoji·p/ was given in a loud whisper. It is apparently a mythic utterance, a distortion of /pgoji·p/ "aunt, father's sister." The action here was later clarified by Mrs. Ohles. Each time the two children went torch-fishing, their Aunt would appear from the water, leaning into the boat and crying "/gočgočgočgoji·p!/." The children remained perfectly still, hoping that she would eventually lean far enough into the boat for them to seize her and cut off her head. Their Grandmother, sitting at home, heard her daughter each time and knew the children would kill her. Hence her repeated sob, "/hãhãʔ/." (The symbol "ã" denotes a nasalized low central vowel. The utterance is anomalous to the phonemic system.)

---

[196] [44] /q̇aWl̥i sialakLas/ was said to mean "Brown spots over the eyes." ‖reesl^{v}ikLe‖ : /sialakLas/ "distributive round objects on top of, reflexive" bears out the translation, but the usual word for "brown" is /kaWkaWl̥i/ ({kaW}). The form /q̇aWl̥i/, otherwise unknown, could perhaps be set up as an allomorph of {kaW} 75v "to be brown."

[194] [45] /kuskuskuskuskus/ is nearly voiceless. Cf. Note 42. There is no apparent reason for the metathesis of /k/ and /s/.

[192] [194] [46] /hõ···/ is an exclamation of disappointment. The vowel is nasalized, and the tone drops from /3/ to /2/ or a little lower.

[194] [47] The segment /loha·nk, loha·nk, goda· ni ṕača·, loha·nk, loha·nk/ is spoken in a measured, heavily stressed tone and in a rather high, faint voice. This applies to further reoccurrences of this myth speech in utterances 18, 33, 52, 53, 75, and 76 of this myth.

[196] [194] [48] /hehji·, hehji·, hehji·!/ is the myth-speech of Hehji·ḱa. No further meaning for the segment /hehji·/ could be found. It is uttered here in a high pitched voice with a strong pitch drop on the final /i·/.

---

[196] [49] The Grandmother's exclamation, here /ʔe···/ and elsewhere /ye···/ (utterances 46, 65, and 96), is uttered in a high, quavering tone that varies considerably in pitch.

[124] [192] [50] Mr. Pompey here became confused momentarily between the Klamath summer house (/wqepíaqs/) and the winter house (/loltḿalʔaqs/). He had previously stated that Hehǰi·ḱa lived in a /wqepíaqs/ at the time of the story.

---

[192] [63] /ge·/ "this, this one" here refers to the investigator, whom Mrs. Chiles indicated by a gesture.

[103] [64] Mrs. Cowan may have been referring to the town of Bligh (Klamath {blay}) or using the form in its meaning of "above, up." The river mentioned is probably the Williamson River, but may refer to some other stream.

[103] [65] /gome·ksi/ "Cave-place" was a large settlement in aboriginal times. See no. 29 on the accompanying map in the appendix.

[66] /ʔiwli·wa/ "on the edge" was a village site. It seems to be the same as that mentioned by Spier, op. cit., on his map as no. 47 (no. 30 on the accompanying map in the appendix).

[67] The lexical meaning of /q̓ačẃe·č/ could not be determined. For its location, see no. 27 on the accompanying map in the appendix.

[68] /čniWi·ĺs/ also was not analyzable. Mrs. Cowan did not give its location.

#539 ge· gini·gańća. (56) čoy nis la·bi danḱa·k wola· naʔas, "dat mat hok komčewi·s gi?" naʔas nis, "hadakt hak maqlaqs gitk, dat hok gi?" (57) čoy nis danḱa·k (Woman's name) ćis glegatk. "dat mat hok ni·Laqksi gi?"

---

[103] [69] /ha·g krik/ "Hog Creek" might well have been put into quotations. The final /g/ is slightly unvoiced, however, more than an English /g/ in a comparable environment. Its location was not identified.

[194] [70] /si·p/ is English "sheep." Phonemically, it is Klamath.

[192] [71] /go·t/ is similarly English "goat." The flowering plant Mrs. Cowan referred to was blooming just outside her window. /do·/ "there" was explained with a gesture.

539*
124

(55) It was named all up [the rivér]. (56) So two persons] asked me a little while ago, "Where was that Komčewi·s?" he asked me, "where there were Indians, where was it?" (57) And (Woman's name) [who is] deceased, said to me too, "Where is that Ni·Laqksi?"

(58) PO: What is that Komčewi·s?

(59) AC: Yes, it is called thus on the Marsh. (60) At the end. (61) And [I] said, "This along the hillside is Ni·Laqksi. (62) They are all people's dwellings, that was this Sohi·yagye·ks—all along the hillside, Klamath Falls, many people lived [there]."

(63) PO: Do you know the names [of places] on the Marsh? (64)—How they are called. (65) I only remember, when I was little where we always used to go gathering mudhen eggs—at Charcoal Lake. (66) And now I can't find it. (67) And Sg̥otq́aks, I cannot find it now. (68) And what the white people called "Hog Creek," where we used to go and gather blueberries. (69) So they are gone. (70) Thus I told this one, "Those blueberries are gone now." (71) And I wonder if maybe those sheep, ate them up?

[103]
[222]

(72) AC: Yes, having trampled it all down in that way. (73) [Just like] this of mine [which I] had planted here awhile ago—very big around, with red blooms there—and that goat ate it all up. (74) However, it has grown back and shoots are coming there, which have something red on them, that kind.

(75) PO: What was a "goat" called?

(76) AC: I don't recall.

PB: What is a "q́wi·l"?

[192]

(77) AC: They called a "sheep" that. (78) Those Modoc Indians [called it] a "q́wi·l."

PB: And one more, what is "swa·ya"?

(78) AC: What?

(79) PO: swa·ya.

(80) AC: Is it?—a myth, which they called little "Swa·ya." (81) Swa·y—whatever he was, I do not know. (82) There is a myth thus.

---

[192] [100] /ge·ks/ again refers to the investigator.

[551] [101] /ǰo·n/ "June" is the name of Mrs. Chiles' niece, Mrs. June Dick, who is quite
[533] well known on the Reservation and in Portland (her present home) as a singer.
[463] She had gone to *Sheridan, Wyoming*, to sing at the annual gathering of American Indian tribes there.

[192] [102] /ʔi·t/ is the English word "eat," and /lo·st/ is English "roast." In speaking to the investigator directly, Mrs. Cowan felt it necessary to employ frequent English words as supplements to her Klamath explanations.

*539 ho·t lolp, naʔas sa honk ʔelga, boqboq gaʔas.[105] (220) snaps gi. (221) na·nok dwa· ṕan maqlaqs, na·nok dwa·, ga·ʔa·k hoḿas či·ya·. (248) na·nok čeLas mańi· sa honk gaʔas gyank ṕan.

PB: Could you tell me what a "wa·l" is?

(249) PO: dwa· ʔeč hok wa·l? (250) wa·l![107] (251) "le mna ṕle·wa mo·ńs wa·l ʔoye···!"

---

[252] [105] /pa·p/ is English "pop." Mrs. Cowan referred to the "popping" of various
[192] seeds, much like modern popcorn. This was done to that type of very ripe wokas called /stokẃas/, to sunflower seeds, etc. The author had never heard of this process being applied to tule roots (/mayam lolp/).

[192] [106] /kok/ is English "cook."

[107] /wa·l/ was mentioned by Mrs. Ohles in connection with a hazily remembered portion of a myth. She thought it was a type of root, and this is borne out by
[192] Mrs. Cowan. She repeated the name (Sentence 250) in a louder tone of voice, since
[124] Mrs. Cowan tended to be slightly deaf. To further clarify what she meant, she added Sentence 251, which is the myth speech attributed to the chief character in
[196] the myth she could not quite recall. The form /ʔoye···/ wavers off into silence at the end. It seems to be ‖ s-ʔoya‖ : /ʔoya/ "gives a long object," but with modification of the final vowel.

#539

(252) AC: wa·l—hokt ćis dićí· gi. (253) hok gew pḱisap ćosak dat hak gaẃal, q̓ay ni s?aywakta ḱakda·ni hok hom̓as hak. (254) mo·m gida ga?as gitk.[106] (255) ?a·di·ńs da·ts, ?a·di· lentk, wa·l hok. (283) AC: ksegi·.

(284) PO: (That last one means I never paid any attention for a long time, but I will, now, take offence to what this other person says and quarrel with them or fight with them or whatever.) čoy ?an honk lobi·da·ńa s?aywakta, ?at mo· če· gmočank. (Interruption.)

PB: What is a "pḱa·sip"?

(285) PO: kaya·nWa dal hok gitgo—pḱa·sip čoy bloksip? (286) ptisamkedaĺ čoy wage·nhs pḱisamksía?

(287) AC: ?i·, pḱisamkedaĺ bi, hok pḱa·sip. (288) čoy hok dak ptisamkedaĺ, bloksip. (289) pq̓oli·p ḿewe·ts ge·ksíadaĺ, pḱa·sip.

---

[192]

[106] /gida ga?as/ "here this way" refers to the gestured size of the /wa·l/—about three or four inches.

#539 (290) čoy bloksip, ṕe·wip—ʔat ho·t ḱanni gi. (291) ge·ksĺadaĺ lalʔa·bi hok gi.

PB: And what is a "pḱo·nip"?

(292) PO: pḱo·nip, dwa· hok? (293) waq hok nen hasʔa·Mḱa, kańs sa pḱo·nip naʔas ʔelga?

(294) AC: pḱo·nip dak ho·t pʔa·nip gi. (295) ho·t ʔa gew ḱoḱo·nip gi. (Great Uncle.)

(The conversation was carried on in English at this point, mostly about friends from the old days.)

(296) PO: . . . čoy waq dal hok se·satk gi, kańsĺet honk dola či·ya·—kańs honk dola či·ya·?

(297) AC: q̇ay, wiḱa· bańi ʔa mat honk hok sq̇olligo·ta. (298) mna da·k dwa·, waq da·k sa gin—mna da·k honk sʔa·Maks dwa· hak. (299) čoy ho·t sa hon hoḿas gyank ʔat hasʔa·Maḱatk. (300) ptisa· honk blogo·člank, honkĺam honk q̇e·gitk.[109]

(301) PO: ʔi·, honk hay ni ho·skanga.

(The conversation reverted to English and drifted to a recollection of a personal experience from Mrs. Ohles' childhood. The machine was turned off during this time and was only turned on again when she returned to Klamath.)

(302) PO: . . . čoy dank ḿa·sʔa dwa·. (303) čoy ma·ns q̇e·gi, ma·ns q̇e·gi. (304) čoy ndanni waytas q̇e·giwapgatk, čoy ma·ns na·ĺ q̇e·gi, ḿa·sʔok. (305) čoy honk hokt ʔat wosga na·ts, hokt (Proper name). (306) čoy hok gembli, čoy honk ḿa·sis gota·, honkčgas. (307) čoy ma·ms gatbamblyank na·ĺs be·n blay ʔembli, blaydaĺ.[110] (308) waq dal sa blay maqlaqsyalank ʔelga?

(309) AC: blay, či. (310) ge· dak nen gina·t ẏayńa.

---

[192] [551] [576] [109] The form /q̇e·gitk/ is used for respectful mention of a dead person. It was considered impolite to mention the names of the other person's deceased relations in a conversation, and this was extended often to refer to the names of deceased friends and acquaintances. Compare the English "the dear departed."

[103] [193] [194] [110] Mrs. Ohles uses the form /blay/ here to mean only the town of Bligh. It may be that the vowel of the two repetitions of /blay/ in this sentence is somewhat longer than is usual for the Klamath morpheme {blay} "up, above." It is certainly longer than Mrs. Cowan's /blay, či/ in Sentence 309. If so, this may account for Mrs. Ohles' failure to recognize "Bligh" as Klamath {blay}.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

RADICALS WHICH KLAMATH HOLDS IN COMMON WITH OTHER FAMILIES.

121 A number of radical syllables occur in the same or in cognate significations in several linguistic families of the Northwest, and some of them
197 extend even to the stocks east of the Rocky Mountains and of the Mississippi River. This fact is of great significance, as it proves certain early connections between these Indians, either loose or intimate. If the number of such common radices should be increased considerably by further research, the present attempt of classifying Pacific languages into stocks would become subject to serious doubts. From the quotations below I have carefully excluded all roots (and other terms) of onomatopoetic origin. I have made no distinction between pronominal and predicative roots, for a radical syllable used predicatively in one stock may have a pronominal function in another family

193 **-im**, *-ĕm*, *-am*, *-m* frequently occurs as a suffix for the possessive case
197 in the Pacific coast languages. Thus in Klamath -am is the usual suffix of that case, -lam being found after some vowels only; cf. Grammar, pages 317 et seq., and suffix -m, page 355; also pages 474–476. On page 475 I have called attention to the fact that -am occurs as marking the possessive case in the Piṭ River language; itósh̆ĕχam yánim *deer's foot-prints;* -am, -im in Molale: pshkaínshim, possessive of pshkaínsh *beard.* The Sahaptin dialects use -nmi, -mi, etc., to designate this case.

ka occurs in many languages as a demonstrative radix, though it often assumes an interrogative and relative signification and changes its vocalization. In Apache-Tinné dialects it is interrogative: χúte *who?* in Návajo; in the Creek ka is the relative particle, a substitute for our relative pronoun *who.*. In Yuki kau is *this* and *there;* in Yókat (California) ka- occurs in kahama *this*, kawío *here*, yokaú *there.* East of Mississippi River we have it in Iroquois dialects: kĕ′^{n} in kĕ′^{n}t'ho *here* (t'ho *place*); in Tuskarora: kyä' *that* or *this one* (pointing at it), kyä' nä^n *this one;* t'ho i-kän *that one is.** In the Klamath of Oregon this root composes kánk *so much*, káni *somebody*,

---

* My authority for quotations from Iroquois dialects is Mr. J. N. B. Hewitt, of the Tuskarora tribe.

193 kaní? *who?* and kat *who*, pron. rel. As a suffix -ka, -ga is forming factitive
197 verbs and is of great frequency (cf. Part I, pp. 341, 342); ka-á, ká-a, kā is adverb: *greatly, strongly, very.*

ká-i and similar forms are serving to deny statements and to form negative and privative compounds. In Shoshoni dialects g'ai, ka, kats, karu-u, etc., stand for *no!* in Zuñi kwa is the *real* negative particle, like akaí! *no!* in Tonkawē. In Kwakiutl *no!* is kets and kie; in Pani káki; it also occurs in some northern dialects of Algonkin as kā, kawine etc. In Klamath k̲á-i is *no!* and *not;* it composes k̲íya *to lie* and such words as are mentioned in Grammar, p. 633; cf. also p. 644. In some of the Maskoki dialects -kō, -gō, -ku is the privative particle in adjectives and verbs.

mi is a pronominal demonstrative radix, like nu, ni, and also serves to express personal and possessive pronouns. In Creek ma *that* points to distant objects and also forms istä'mat *who* (interrogative). In many western families it expresses the second person: in Mutsun dialects men is *thou*, in Miwok mi; in Wintún mi, me is *thou*, met *thine, thy;* in Maidu mi is *thou*, mímem *ye*, mō'm, mú-um *that one;* in Yuki meh, mi is *thou* and in Pomo ma is *ye* (me *this*); in Ara and Sahaptin mi is transposed into im, *thou*. Shasti has mayi and Pit River mih, mi for *thou;* Sahaptin im, imk *thou*, ima, imak *ye*. In Klamath mi stands for *thy, thine*, mish for *thee, to thee*, but i for *thou;* -ma is a verbal suffix, q. v. There are languages where mi, ma makes up the radix for the first person and not for the second, as Sioux and Hidatsa of the Dakotan family; while in the Shoshoni dialects *thou* is omi, umi, um, em, etc., and in Yuma ma-a, mā. In the Nez Percé of Sahaptin ma is the interrogative pronoun *who?* and *which?* and also forms plurals when suffixed to nouns.

náka, the Kl. term for *cinnamon bear*, probably related to nákish *sole*, as the bears are *Plantigradæ*, has many parallels in American languages. The Yuma dialects have nagóa *bear* in Huálapai, nakatya, nogudia in Tonto; Yókat has nohóho *bear*, Alíkwa níkwiχ *grizzly bear*. If the yáka of Sahaptin is from nyáka, it belongs here also. East of Mississippi River there is only one species of the bear, the *black bear*. The radix nak-, nok- occurs in the Tonica language nókushi, and in the Maskoki dialects: nók'husi in Creek, nóχusi in Hitchiti, but níkta in Alibamu.

193 **nkól**, *nkū́'l*, *nχól* in Klamath designates the *gray white-tailed rabbit*, and
197 the same radix appears in kō'lta, k̲ólta *fish otter* and in kû'lsh *badger*. In the San Antonio language of Southern California the radix is represented by kôl *hare* (*rabbit* is map), in Kasuá (Sa. Barbara dialect) by kú'n, in Tonto by akolá, kulá, in Hualapai by gula. Even in the Inuit dialects we find for *rabbit:* ukalik (Hudson Bay), kwélluk (Kotzebue Sound).

nu or **ni.** A pronominal demonstrative radix n- followed by almost any vowel (na, nu, ni, etc.) is of great frequency in America as well as in the eastern hemisphere, where it often becomes nasalized: nga, ngi, etc. In American languages it forms personal possessive and demonstrative pronouns, prefixes and suffixes of nouns and verbs. In South America nu, nû designates the pronoun *I* or *me* so frequently that the explorer K. von der Steinen was prompted to call *Nu-languages* a large group of languages north and south of Amazon River, including Carib dialects. In America nu, ni designates more frequently the *first* person of the singular and plural (*I*, *we*) than the second *thou*, *ye*. It stands for the first person in Quichhua, Moxo, Tsoneka, in Nahuatl, the "Sonora" and Shoshoni languages, in Otomi, Yuma, the Tehua and Kera (*no* in hi-*no*-me *I*) dialects of New Mexico; in Wintún, Maidu, Wayłletpu, Sahaptin, and the numerous Algonkin dialects. For the second person it stands in Yákwina, Tonkawē, Atákapa, and in Dakota and Tinné dialects. As a demonstrative pronoun we find it used in many languages, *e. g.*, in the Onondaga of Iroquois, where nā'ye' means *that, that it is*, and nā'ⁿ (ā *long*) *this*. In Klamath nû, nî is *I*, nútoks *myself*, nish *me, to me;* nāt, nā *we*, nálam *ours;* -na is case suffix and transitional verbal suffix; n- prefix refers to objects *level*, *flat*, *sheet-* or *string-like*, or extending *towards the horizon*.

shúm, sû'm is the Klamath term for *mouth* of persons, of animals, and of rivers. Forms parallel to this are disseminated through many of the Pacific coast languages. In Kayuse it is súmχaksh, in Molale shímilk, in Nishinam and other Maidu dialects sim, in Yokat sama, shemah.[*] Intimately connected with *mouth* are the terms for *beard:* shú, shó, shwó in Sahaptin dialects, shimkémush in Kayuse, and for *tooth:* sí, shí in the

---

[*] It occurs even in South America: 'sími in Kechua is *mouth* and *word;* shúm in the Patagón of Brazil, *lip;* Martius, Beiträge, II, 211.

193 197 Wintún dialects, sūχ in Yuki, sit, si-it in Mutsun (coast dialects), sa in Santa Barbara, tcháwa in some dialects of Maidu. It is justifiable to regard Kl. shúm as an ancient *possessive case* of the sí, sa *tooth* of Central Californian languages; cf. what is said concerning the suffix -im.

tút *tooth* appears related to tuχt *tooth* of Sayusla, a dialect of Yakwina and also to tit of the Sahaptin dialects; ititi "his tooth" in Walawála.

tchi-, *tsi-* is a radical often used on the Pacific coast referring to water or liquids, their motions, and the acts performed with or within the watery element. While in Klamath it figures as a prefix only, q. v., other tongues make use of it as a radical. Tchí is *water* in Yákwina, in Takílma, and in the Yuchi of the Savannah River; in Zuñi 'tcháwe is *water* ('t alveolar) in Nója tchúdshe. The Sahaptin dialects show it in Warm Spring tchū'sh *water*, atá-tchash *ocean;* in Klikatat tcháwas *water*, atá-tchis *ocean*, tcháwat *to drink;* while in Nez-Percé tchū'sh changes to kúsh. Chinook has 'ltchúkwa *water*, Ch. J. salt-tchuk *ocean*, but the Selish languages employ a radix se-u'l, si-u'l, shá-u instead to designate any liquid.

wá *to exist, live, to be within*, and *to grow* or *generate* is a radix to be traced in many of the Western tongues. In Klamath we refer to wá and its numerous derivatives, as wawápka *to sit* or *be on the ground*, wá-ish *productive*, wá-ishi, wéwanuish, wē'k *arm* and *limb of tree*, lit. "what is growing upon," wē'ka *offspring*, wékala, wásh *hole to live in*, wā'shla (a) *to dig a burrow*, (b) *ground-squirrel*, and many others. In Kwákiutl wāts, wátsa is *dog*, but originally "living being, animal," and is represented in Klamath by wāsh *prairie-wolf*, wátch *horse*, watchága *dog*, lit. "little animal," the idea of "domesticated" or "belonging to man" to be supplied. In Chinook the suffix -uks (for -waks) points to living beings also. The Sahaptin languages show this root in wásh *to be, exist*, in Nez Percé wáχosh *alive*, wátash *place, field, earth*, in Yákima wakχash *living*, and in other terms.

AFFINITIES IN WESTERN LANGUAGES.

192 197 Many of the Western families exhibit but little or no affinity in their lexicon with the Klamath language, the reason being undoubtedly that they are but little explored. Thus in *Mutsun* a single term only was found to correspond: tcháya *shallow basket* in the dialect of Soledad; *cf.* tchála and

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

114 stage before the publication of the present volume. Even the author experienced considerable difficulties before he could pass beyond that limit. [191] When he reached the reservation agency he found not over three or four individuals who were able to speak a tolerable English, and the knowledge of this tongue is absolutely necessary to any one who aspires to the position of an interpreter of his own language in those parts. The Indians were nearly all pure bloods, and most of them knew scarcely more than a dozen English terms. Many could converse in Chinook jargon, but the majority, especially the females, were not acquainted even with this precarious means of intercourse. Indeed, these people must be slow in acquiring an Aryan language like English, for it presents so many characteristics [193] entirely opposite to those of Klamath. English is not provided with reduplication, prefixes of form, nor with the multiple suffixes of Klamath; it differs from it also by its more complex syntactic structure, its imperfect nominal inflection, by its distinctive form for the nominal plural, the gradation of the adjective and adverb effected by suffixation, its personal inflection of the verb, and a long array of irregular and auxiliary verbs.

124 Thus it will be easily perceived that the obtaining of correct and reliable ethnographic and linguistic information in such a tribe is fraught with many difficulties. Sometimes it is practicable to get the terms for visible objects by making gesture signs or by pointing at the objects, but it just as often misleads; and if the investigator has to do with people who know no other language than their own, he must revise his notes with many of them before he can place any trust in what he has written down from dictation. [191] The Indians and mixed bloods who have made some progress in the acquisition of English pronounce *f* as *p*, *v* as *b*, *r* as *l*—are modeling English after their own language, using *he* for our *he, she, it, they, him, her, them;* all this being hû'k, hû't, hû'nk for them. They do not know how to use our conjunctions, a defect which makes all the tales, myths, and other textual information unintelligible. The only means of obtaining results is to pick out the best people from the crowd and to train them for awhile for the purpose wanted, until they are brought so far as to feel or understand the scope of the investigator. Women will be found more useful than men to inform him about myths, animal stories, the gathering of vegetable food, house-

THE ELEMENTARY DEITIES.

776 In the Klamath theology the deities of the elements have preserved almost intact their character as representatives of the powers of nature. Imperfectly anthropomorphized as they are, they appear rather as spirits than as gods; all of them, the Earth perhaps excepted, are of the male sex. [193] Like the animal genii they assume the adjectival suffix -ámtchiksh, abbr. -amtch *bygone, ancient, belonging to the past,*[*] though less among the Modocs than in the northern chieftaincy. The splendor, power, and awe-inspiring qualities of these superhuman beings is not diminished in the least by the grotesque exterior and acts ascribed to some of them. The sky gods were more plastically defined by popular imagination than the subterranean deities, and hence we begin our sketch with the former.

K'MÚKAMTCH.

> Ille mihi par esse deo videtur,
> Ille, si fas est, superare divos.

The chief deity of the Klamath people, the creator of the world and of mankind, is K'múkamtch, or the "Old Man of the Ancients," the "Pri- [192] meval Old Man." The full form of the name is K'muk'-ámtchiksh, and Modocs frequently use the shorter form Kĕmúsh, K'músh, an abbreviation of k'mútcha, *he has grown old, he is old,* or of its participle k'mutchátko, *old.* He is also named P'tísh-amtch nálam, *our old father.* He was also designated P'laitálkni, *the one on high,* though the term is now used for the God of the Christians. In every way he is analogous to the "old man above" or the "chief in the skies" of the Indians of Central California.

773 What the Indians say and think of their chief deity I have outlined 776 in the Dictionary, pages 138–140, and what follows here will substantiate 772 the data given there. Though K'múkamtch is reputed to have created the earth, what is really meant is only the small portion of the globe known to and inhabited by this mountaineer tribe, and not the immense terrestrial globe, with its seas and continents. Neither have these Indians an idea of what the universe really is when they call him the creator and

---

[*] In Nahuatl we may compare the reverential suffix -tzin, and in Shoshoni dialects the parallel one of -pitch, -bits; e. g., múbu *owl* in Bannock is mú'mbits *owl* in the Shoshoni of Idaho.

823 as poetical, that the Earth is our common mother. "She is dealing out her bountiful gifts to her children, the human beings, without envy or restraint, in the shape of corn, fruits, and esculent roots. Her eyes are the lakes and ponds disseminated over the green surface of the plains, her breasts are the hills and hillocks; and the rivulets and brooks irrigating the valleys are the milk flowing from her breasts." This is the poetical imagery in use among the Eastern Indians when the Earth is mentioned to them.* The idea that earthquakes and unaccountable tremors or noises within the body of the earth, also the malarial fevers, are the utterances of threat or displeasure at the misdoings of mankind, is as general among Indians as among other nations, and a consequence of the animistic tendency of primitive nations. The Indian prophet Smúχale at Priest Rapids, on Middle Columbia River, and his numerous followers, called the "Dreamers," from the implicit faith these Sahaptin sectarians place in dreams, dissuade their adherents from tilling the ground, as the white man does; "for it is a sin to wound or cut, tear up or scratch our common mother by agricultural pursuits; she will revenge herself on the whites and on the Indians following their example by opening her bosom and engulfing such malefactors for their misdeeds." This advice was probably caused by the common observation that ground recently broken up exhales miasmas deleterious to all people dwelling near.

[193] That the Earth was regarded as an animate if not personified being is
shown by the form käflash of the objective case (125, 1), this case being
formed in -ash only in terms applied to man and quadrupeds. Their myth
[821] of the earth's creation of course does not refer to the whole globe, but only
to the small part of North America known to these Indians. The earth's
interior is also the home of the Thunders, because lightnings are often
observed to shoot up from the earth into the skies.

[539] Special songs referring to the Earth are contained in 175; 16: käfla nû shuinálla; 176; 3 käfla ai nû wálta; 158; 48 käflanti nû shílshila—

---

* After Tecumseh had delivered a speech to Governor Harrison at Vincennes, in 1811, he was offered a chair by the interpreter, who said to him: "Your father requests you to take a chair." To this Tecumseh made, with great dignity of expression, an answer which has since become classical: "*The sun is my father, and the earth is my mother; and on her bosom will I repose,*" and immediately seated himself, in the Indian manner, upon the ground.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

773 776 821 genius presiding over it. This genius is called Tchitchatsχä'-ash or "Big Belly;" he is represented to be an old man whose vigor of life is on the decrease. When he leaves his lodge, his appearance embodies the rain-laden, dark-hued, thick nimbus clouds overhanging the earth. When his engine* comes into action, he attracts by it all the objects within reach, he oppresses the earth with his weight, and forces wayfarers to walk in other paths than they intended to travel lest they may incur danger to life. When he has spent his force by this wanton display, he is rent by a stroke of lightning or a strong gust of wind; he is dissolved into atoms, and the bones filling his big paunch, which had produced the rattling noise attending the course of whirlwinds, fall down to the ground. Tsáskai, the Weasel, the brother of Marten, wrestling with the old man and conquering him after a hard struggle, is the mythic agent who brings about his final discomfiture.

SPIRIT DEITIES.

'Εκτέταμαι φοβερὰν φρένα, δείματι πάλλων.

775 776 No people has ever been discovered that did not believe in the return of human souls after death to their former homes in the form of ghosts. Ghosts or spirits hovering through space are invisible and may inflict damage to anybody without danger of being recognized; therefore they usually inspire awe and terror, and wherever the existence of these fanciful beings is recognized imagination fills the earth, the atmosphere, and the waters with such spooks. Not all of these are necessarily supposed to be the souls of the deceased, but they may also represent the souls of animals, the spirits of mountains, winds, the celestial bodies, and so forth, for animism has its widest sway in this sort of superstition. Very different qualities are ascribed to each of these hobgoblins or spooks. They are either gigantic or dwarfish in size, powerful or weak in body, attractive or repulsive, of [787] beneficial or wicked influence. They chiefly appear at night or in stormy weather; some are seen single, others in crowds, and a few of their number

---

[193] * Shû'kash is the substantive of sh'hû'ka *to whirl about*, this being the medial distributive form of húka *to run about:* sh'huhóka, sh'hú·oka, sh'hû'ka "*to run about by itself in various directions.*"

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

128 impossible, the *sense* of the word or phrase was reproduced as faithfully as could be done within the narrow space allotted. Words in brackets were inserted only to render the sentence complete.

But to the student striving after a thorough understanding of the texts all these helps will prove of partial assistance only. A thorough study of the Grammar ought in fact to precede their perusal, and reference to all the three portions of the work will frequently be necessary.

The material portion of a language can be faithfully conveyed to our understanding only by the correct pronunciation of its words, sentences [194] or texts. Hence all that is said of Klamath *phonetics* must be studied first, and more especially the alternating processes, the proclisis and enclisis, the sounds not occurring in English (as the linguals, the aspirate *χ*, the vowel *ü*), and first of all the pronouncing list of alphabetic sounds, which is subjoined. To initiate readers into the distinction, empirically obtained from the mouths of the natives, between the clear vowels *a*, *e*, *i*, *u*, and the dumb or deep-sounding *á*, *é*, *í*, *ú*, the earlier pages of the texts contain more indications than are given in the later. In certain terms long vowels can turn into short, and short into long ones. Special attention must be paid also to the study of elisions, apocopes, metatheses, etc.

[193] In the *morphologic* part of the Grammar, the verbal and nominal paradigms are particularly recommended to the student's attention, and a previous knowledge of the mode of forming the distributive reduplication from the absolute form is indispensable to the reader of my Texts, not only for their full comprehension, but even for the use of the Dictionary. The suffix of the future tense is written *-uapka*, to distinguish it from a homonymous form *-wapka*, of different signification. The apocopes occurring in the conversational style of language will soon be recognized as such by the reader; for example, *-tk* for *-tko*, *-ks* for *-kshi*, dropping of *-a*, *-ash*, etc.

To make the study of the Texts too easy by a flood of notes would be as obnoxious to the true interests of science, as to present unsolved too heavy grammatic difficulties to intellects yet untrained in the modes of Indian speech. Scholars may decide to what degree I have succeeded in avoiding both extremes.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

173	selluálshuk.	Ndánnitaksni	taměnō'tka;	tiná	nat	ḵáyak	shenótankatk,

NOTES.

[197] 19. The long and fertile valley of the Pit River, an eastern affluent of the Sacramento River, is inhabited by several tribes of Indians who speak dialects of the same language family. Of the peculiarities of these tribes, Stephen Powers has given the first comprehensive sketch in the Overland Monthly, 1874, pp. 412–416, and in Contributions to North American Ethnology, vol. III, pp. 267–274. The various tribes greatly differ in their physical and mental qualities. The Pacamallies, on Hat Creek, at the lower end of the valley, were much dreaded by peaceable travellers on account of their sudden attacks from an ambush. The Indians in Big Valley are a fleshy, stout, and physically well-made people, while the Hot Spring Valley people has become deteriorated through prolonged national misfortune. Against both of these the slaving raids of the Klamaths and Modocs were mainly directed.

[721] [567] [727] 19, 2. The raids were undertaken by the Klamaths and Modocs just before wókash-time; that is, in April and May. They had no other purpose than to make slaves of the females and children of the unwarlike, poor, and suffering Pit River Indians, and to keep them either at their homes or sell them for ponies, provisions, beads, etc., at the Dalles to the Columbia River tribes. Adult men were not enslaved, but killed outright if captured. Similar instances of suppression of weaker tribes of the West by warlike Indians who were their neighbors are those of the Kayuses on Middle Columbia River, of the Yuki between Sacramento River and the Pacific Ocean, of the Húpa on Trinity River, Cal., all of whom were, at the advent of the whites, the terror of the districts surrounding their homes.

[248] 19, 3. shläótak for shläóta ak; the Pit Rivers ran away at the *mere sight* of the Klamath men; ḵá-i tata siúkat, the Pit Rivers never killed any Klamath men. Both statements are exaggerations; Hill's own account and Toby Riddle's biographic notice tend to prove the contrary.

[727] 19, 3. nellínat, or neli'nat. When they had killed an enemy, they did not follow the custom of the Oregonians of taking the scalp. This custom is not found among any of the Central Californian tribes.

• [193] 19, 4. hû'stchoḵ-huya; by the suffix -huya, -uya, the action of the verb is shown to take place at intervals, or in a small degree. "They did only little damage by killing or massacring." Cf. shenótank-huya, 20, 2, and -uya in the "List of Suffixes".

[196] 19, 4. tû'm tát sa. Change of the subjects introduced by the pronoun sha, sa, in consecutive sentences, is sometimes observed, as here and in 19, 16; 20, 3. Hill often uses sha when speaking of the Klamath Lake men, where nat, *we*, would be more appropriate.

[193] 19, 6. Kitchkanin nû for kitchkáni nû (or ni) nû. Pronouns and particles are repeated quite frequently.

19, 11. Wúksalks is a camping-place distant about six miles from Linkville. It was not possible for me to obtain definite information about the trail followed most generally in those raids, but Dave Hill said that from there they went due south. He

173 was born about the year 1840, and since he was a boy then, carrying only a pistol, this
*539 raid may have taken place about the year 1858. His second raid, which was under-
taken the year afterward, was made when he was nearly twenty years old. After this
726 he stayed five years in Oregon City, on the Lower Willámet River.

19, 16, and 20, 1. What is said here up to the word snawä'ds is evidently an anticipation of what follows in 20, 6. 7.

[192] 19, 16. sas tillindsa, or shash tilindsha: shash is apposition to wéwanuish, which stands here, as frequently, for wewanuíshash; 23, 5, we find: wewánishash.

20, 2. lápik for lápi gí: "two are, two were."

[487] 20, 9. Tiunō'leshtat. The distance between Klamath Marsh and the Pit River country was estimated at three days' Indian travel; but it often took four days to reach there on horseback.

[192] 20, 10 and 11. maklakskaákai refers to the encampment and immediate surroundings of the Indian captors, the Klamath Lake men and the Modocs, who had gone with them.

[487] 20, 13. guhuáshktcha. They seem to have returned home over the same trail which they had followed in going south. They passed between Little Klamath and Rhett Lake, which latter is also called Tule and Modoc Lake.

[193] 20, 17. tsúi gé-u, etc. This sentence has to be construed as follows: tsúi gúikaka hú'k lū'gs spunísh gé-u: "hereupon that slave, transferred by me, ran away."

21, 2 and 3. Bóshtin tpā-ók. This man was an American settler on Lost River, [648] who, with other settlers, had previously attacked one of the Pit River tribes, in punishment for depredations committed. In the fight which took place, some whites were killed by the Pit Rivers, and this prompted the abovementioned settler to slaughter an ox for the Lake men, in order to raise their spirits for deadly revenge on the common enemy. The beef was slaughtered and eaten at his farm.

21, 5. Tsúi nat, etc. This incident was explained to me by Dave Hill, as follows: The famous Captain George was at that time war-chief both of the Klamaths and the Modocs. He had ordered Kiukamtch, the head-man of the Nushaltkágu=Modocs, to join the expedition against the Pit Rivers. His refusal to go prompted Dave Hill and others to deprive him of his elk-skin cuirasses; but finally, to secure success to the expedition, the parfleshes were returned to their owners.

[193] 21, 7. Húmasht nat. A verb like gí or shúta has to be supplied.

21, 12. séllaluish, translated here by "war-expedition", still retains its verbal nature; for it is connected with two temporal *adverbs:* lupí' and húnk. More circumstantially the sentence can be rendered: "we rode far beyond the terminal point of our previous raiding campaign."

[193] 21, 18. léwak, a verb composed of two particles. Gétak and kánktak, formed almost in the same manner, are also used as verbs. Below, léwak is separated into its two components by a pronoun: lä nāt wák ka-á; lä' nāt wák galdsawiá-a.

21, 19. wéwansni. The terminal -ni turns the wéwanuish into a kind of adjectival phrase. See the peculiar use made of this ending in the Dictionary and in the Grammar.

22, 8. hátaktk. The final k is the verb gi, ki, "said"; tchín hátaktk is: tchí nū hátakt gi.

[302] 22, 21. shatchlχámia is one of the various modes of painting face and body in use among the western Indians. White paint was put on in this manner (see Dictionary) only when the Indians were on the war-path. From the same verbal base is derived

173 shatchō'lgi, to contract the half-opened hand or fingers. Compare also: shatχä'dsha,
*539 shátuaχa, shátëlakish.

726 23, 6. gakayúluk refers to the women, not to the Klamath men. These latter retired with the captured females to the top of a hill, to secure themselves better against further hostile attacks. shíshatχa, distributive form of shíatχa.

23, 11. tinkayúla. The Pit River men ran out of the timber to flee from further attacks, and some ran up the steep bank from the dry river-bed. While they did so, the Lake men surrounded them and completely closed the circle (shtá hashámpka). Nevertheless, some of them managed to break through the intervals; this frightened the Klamath men, and then the other Pit Rivers also escaped towards the hills.

23, 12–14. The three men and the boy who went up the hill belonged to the Pit Rivers. The Klamath Lake warriors were so surprised at their sudden return to their surrounded companions, that the Pit Rivers had an opportunity to escape during the confusion.

● 193 196 24, 4. Nátak. The sentence has to be construed: nátak híshlan hû'nk, Moatuáshash hû'nk ksápok. "None others but ourselves shot at him; though he was one of our men, we thought him to be a Pit River man".

24, 4. láki. He had been shot in the eye-bone.

24, 6. k̲lä'kat stands for k̲lä'ka at; cf. 28, 12. gátpant for gátpna at.

24, 6. shewatχû'lsl: for shewatχō'lash l, or shewatχō'lish l; the l appearing here not as a local, but as a temporal case-suffix. shewátχa, *noon*; lit.: the day divides itself in two; shewatχō'la, *afternoon*, the day has divided itself in two *a while ago*.

24, 8. luluksgä'-ish, uncommon form for lúluksgish, lólokagish, *rifle*, *gun*, lit. "fire-maker".

24, 17. síukshtka stands for the full form síukshtka gi.

24, 18. tuti'la. By inadvertence the distributive form is used here instead of the absolute form tuíla, for the Pit River man spoken of had an abnormal fleshy excrescence on *one* foot only.

25, 1. shéllualshuk: he means fighting with the Pit River Indians.

25, 1. ndánnitakani, incomplete grammatic form for ndannitánkshni.

25, 2. kínka-ak i, only a few; meaning females of the Pit River tribes.

173 **28, 2.** gépkapsh, formed by syllabic elision from **gepkápkash**; cf. **29, 19.**

*539 **28, 2.** sákatla, to come up, to arrive by the trail.

726 **28, 3 and 4.** wéwalíks pi'la, the old women only; the younger ones, on whom prin-
648 cipally devolves the work of wókash-gathering, found time to escape in their canoes
[193] from the raiders.

[192] **28, 4.** k̲'lewidshápka. The men had gone fishing to distant places, leaving their
[222] females in the camp, not apprehensive of any hostile attack.

[192] **28, 8.** kilŏ's, or k̲ilû's, is the epithet given to "Dry-Leg", the Snake chief; it means
a bold fighter, leader of a fighting band; literally: "irate, wrathful", and may be here
taken as an equivalent to "war-chief" (sesaclólish lak̲i).

[193] **28, 13.** Moadoki'sh, apocopated for Moadokíshash; also **28, 1**: wówanuísh (wé-
[192] wan'sh) for wewanníshash (shlä́á gépkapsh). Nā'lsh tchi'sh, *us* also; that is, we of the
[657] Klamath Lake tribe, were gathered by Mr. Perit Huntington into one district, the newly
established Klamath Reservation. A large number of the Lake People were then scattered about Klamath Marsh, which is visited by them now in summer only for fishing, gathering wókash and berries, and for hunting.

[657] **28, 14.** Dave Hill, now interpreter (lúldatkish) at the Klamath Lake Agency, took
[175] a part in this short but interesting expedition, in the capacity of an Indian scout. He
fixes himself the date of it by the words "tína illolólatko", or a *full* year after the Indians had been gathered on the Reservation by Mr. Perit Huntington. The treaty was concluded on October 14, 1864, and the campaign was undertaken in 1866 by a small body of American troops for the purpose of bringing back to the Reservation a band of Snake Indians who had run away from it. This unruly tribe, jealous of its former independence, has left the Reservation even since then, and could only after much exertion be induced to return. The fights took place west of Warner Lake, and north of the border-line between California and Nevada, within the former haunts of these western Shoshonis.

[175] The Report of the Acting Commissioner of Indian Affairs for 1867, page 99 sq.,
mentions this expedition in the following laconic terms: "October 27, 1866, troops consisting of 21 men, First Oregon infantry, and five Indian Klamath scouts, under Lieutenant Oatman, and 27 men, First Oregon cavalry, under Lieutenant Small, had a fight with a band of hostile Snake Indians near Lake Abbott [should read: Abert], in the Klamath country, Southern Oregon. The Indians had so chosen their position that the troops were obliged to dismount to attack them. The fight lasted one and a half hour, and 14 Indians were killed and many wounded."

On page 100 of the same Report, another fight against Snake Indians is spoken of: "Late in November, 1866, in a conflict between the troops and Snake Indians near Fort Klamath, 10 Snake Indians were killed by the troops, and three more by the friendly Klamath and Moadocs who accompanied them." This may have been the same fight as the one above, reported with much less accuracy of detail.

[103] **29, 3.** Spá-ish Valley, name corrupted from Surprise Valley. This valley is situated in the northeastern angle of California, and on the shore of its two alkali lakes several American settlements have sprung up. A few Snake Indians live peaceably around Fort Bidwell, which is located at the northern extremity of the valley.

[192] **29, 10.** tálaat tχalamti'tal, consonantic assimilation for tálaak tχalamti'tal, due west.

29, 17 and 19. nā'ts, natch, for nā'ls, nā'lsh, nā'lash, *us*; náts a gépksi, for nā'lash a gépkash í.

173
*539

726 648 **29, 17 and 18. gayá-itsampk.** The advance of the troops was ordered in consequence of Hill's report that Snake Indians had been seen by him and his fellow-scout.

[192] **29, 19. tú'-shak;** hak means: on this side of something or somebody, referring to an object located between the speaker and something more distant.

[193] [196] **29, 19 and 20. shlä'pka** (for shlä'apka) and tássuipk (for tássui-apk) "they saw and attacked them in Hill's absence"; tínshampk "they scampered off unseen by Hill". If the simplex verbal forms shlä'a, tássui (or táshui), tínshna were used, they would imply that Hill then saw the Snake Indians himself, that he was among the troops charging them, and that he had seen them *in person* scampering off.

30, 3. lewé-ula really means: not to permit, not to allow, to forbid.

[192] **30, 3. tchín gi,** short for tchí ni gi: "so I said."

30, 5. Instead of gatpánkshkshi could also stand in the text: gatpannápkshi; the final -i being used in a temporal sense in both terms.

[193] **30, 8. kú'meta,** contr. from kú'mme tchish, or from kú'metat tchish.

30, 9. snashuála, etc. They piled up rocks to serve them as barricades to shoot from behind.

[192] **30, 11. u-i'tsna,** distributive form of ó-itchna; see Dictionary.

[193] [196] **31, 7. Nä'wapksh, etc.** Transcribed into the fuller and more explicit grammatic forms, this phrase would read: Nä'wapkash yamakishtana kétcha tχálamna, "to the northwest of Goose Lake." For Nä'wapksh, Né-uapksh, see Dictionary.

31, 13. This campaign terminated in a decided victory over the runaway Snake warriors, but failed to accomplish its real purpose of bringing them back to the Reserve. Nevertheless, these Indians had been severely chastised by losing quite a number of men killed and wounded, and seven women of their tribe captured by the military.

River near the Natural Bridge; me wife mine together he hired
lutatkátki.
to be interpreters.

At nā nánuk ne-ulakgishχē'ni gátpa; nánuk máklaksh wawápka,
Then we all to council-ground went; the whole tribe was sitting there,
vûni'pni hundred pēn ndā'ni tá-unep pēn vúnip pé-ula hihashuátchχāsh,
four hundred besides three tens besides four men,

*539 622 692 hishuáksh m'na wudópka, tsúi ní snawä'dshash hû'nk nä'-ulχ, k̲á-i hû'nk
husband her whips, then I wife that punish, not the
hishuákshash, láp súndē.
husband, for two weeks.

[593] [683] Tsúi tchik kíuks tchí'sh títatna tawí shash, tsúi hûk k̲'lěká tawí'sh.
Then a conjurer also at times bewitches them, and dies the bewitched one.

[683] Tsúi ni nä'-ulχa, tsúi tû'nip sháppash spû'lhi-síukst; tsúi tchik wátch nísh
Then I try (him), and for five months imprison for manslaughter; and (if) horses to me

[593] sχókta tû'nip, tsúi ní k̲á-i spû'lhit sχoktí'sht nísh. Tsúi tch lak̲í ts ktû'pka
he pays five, then I not may imprison (him), he having paid me. And (if) a chief beats

m'na snáwädsh, tsúi ní snä'kělua; gä'tak lak̲í gí hûk.
his wife, then I remove (him); no longer chief remains be.

NOTES.

[177] **58–62.** The legal practices, regulations, and ordinances given here by a subchief of the Klamath Lake tribe are observed by all the chiefs, and are apparently fashioned after American models. The principle which seems to guide most of the judicial decisions of the chiefs, is given in one (59, 20. 21) of these regulations: "If a chief makes law like white people, that will be right."* This article is composed of three parts:

Part I. List of the chiefs acting as judges on the reservation in 1877.

Part II. Legal customs governing the Klamath Lake people.

Part III. Instances of application of these legal customs; amount of fines, terms of imprisonment, etc. These are the "*novellæ*" of Klamath legislation.

58, 1–3. P'lú, Lilu, and some other headmen mentioned here have signed the treaty of Oct. 14, 1864.

[563] [657] **58, 4.** Móatuash. There are only two Pit River *families* living on the whole reservation.

58, 8. Tchákto̅t belongs to the Yahúskin tribe of Snake Indians. Cf. Ind. Aff. Report 1873, p. 324.

● [193] **58, 10 etc.** The future tense employed in these behests, regulations and defenses recalls the French future used in an impressive manner instead of the imperative: *tu ne tueras point, tu ne déroberas point.*

58, 10. shlí-uapk shash. The pronoun shash has here almost the force of a reciprocal pronoun, for the meaning of the sentence is: "do not shoot at people of your own tribe." The same is true of sas in pallnápk sas, 58, 10; 58, 13 (twice); pálla shash, 61, 14.

[194] **58, 10.** ksaggayuapkámani is pronounced as one word, as the removal of the accent from the syllable -uápk demonstrates; and so in many of the following verbs standing in the future tense. For the sake of clearness, I have preferred to resolve these forms graphically into their component elements.

[192] [193] **58, 11.** wátsam, etc. The possessive wátsam stands here instead of the instrumental case watsátka through attraction from wännikísham. Tchíkla here means to ride away on another's horse, the horse being missed by his owner.

---

*Dave Hill introduces himself in the first person as chief; but many of these decisions can be given by the headchief only, not by any of the subchiefs, to whose number Dave Hill belonged. The Modocs at Yáneks claim to observe these regulations; the Snake Indians do not.

*539 58, 15. shetcháktanuapk stands for the more common form: shitcháktanuapk.

622 692 58, 16. nánuktua shéshatuish m'na: "all what your husband has transferred to your parents to obtain your hand"; m'na stands for hishuáksham. Cf. 61, 8.

● 193 192 59, 7. mish, *you*, *to you*, is often used in this article for málash, málsh, *ye*, *to ye*, in allocutions to two or more persons. This is a way of expressing what may be called the "inclusive plural of the second person". This mode of speaking is observed in m's lápuk, 59, 7; lápuk mish, 59, 7. In the same manner 1 stands for ăt, 59, 8: 1 sissók-uapk, if ye whip each other; also 60, 22.

59, 9. 1 mí stands for mish mi.

59, 17. hă k̲úi gí'uapk: if he should fail to do his duty; 59, 19. hă tídsh gí'uapk: if he does his duty well; nanuktuánta: in every respect.

59, 22. i'χaks mí: what you may win by betting on the horses engaged in the race.

60, 2. kă'lish is the objective case of kă'liak, kéliak, "not having", the simple form of which, without -ak, would be kă'li or kă'liu (kă'li hû).

583 60, 11. túma wátch gitk. The horses have, of course, to be transferred to the parents of the bride and not to any of the chiefs.

231 60, 12. wátch. The horses owned by the Klamath Lake and Modoc people are valued from 20 to 25 dollars each; they descend from the hardy, enduring race of Cayuse ponies, and were originally obtained by bartering commodities with the Columbia River Indians at the Dalles, Oregon.

192 193 60, 15. wátch spuní'-uapka; wátch refers to *one* horse only, for the verb spuní', to transfer, is used of one (living) object only; shăwána is: to give *many* objects. "Not even one horse your wife has to give to you, if she leaves you; but if you leave her, you must give her several."

177 595 60, 17. láp snawă'dshla. Polygamy was abolished by the headmen of the tribe shortly after the establishment of the reservation, and this ruling was one of the greatest benefits ever conferred upon that tribe by the progress of civilization. But those who had several wives then were not compelled to dismiss all but one, and so in 1877 two or three men were still polygamists. The irascible and excitable disposition of the Modoc and Klamath females must have produced many chin-music intermezzos with their husbands at the time when polygamy was predominant.

193 61, 3. K̲á-i mí'sh etc. In this paragraph, in: k̲í'tgik, káktak, hémkanktgik, gitkik, the terminal k contains the abbreviated gi, which joined to the foregoing nû, n means *I said*. The construction runs as follows: Hû'nk ni gi k̲á-i mish k̲í'tgi; nánuktuanta káktak gi píla m's n hû'nk hémkanktki gi; nă'-ulakt gí'tki 1 snawă'dshash tchí'sh káktak gi píl. K̲á-i etc.

61, 6. tchik. This particle does not mean *if*, but cannot be rendered *here* (and below) with a more appropriate word. It is identical with tchĕk, *then*. A subordinate clause is here expressed by a co-ordinate one. Cf. 61, 9. 10. 12. 62, 4.

192 193 61, 6. któktatska: "we clip their hair in every instance", is the distributive form of któtchka, któtska, occurring in 58, 16.

61, 9. Tsúi etc. This inverted sentence has to be construed as follows: Tsúi tchiláash híshuaksh wutódshish snawă'dsh m'na pă'n hû'nk snúkp'la, tsúi nă'-ulĕkan etc.

plied, for Minnie sending to interpret the agent for conversing with.

NOTES.

64, 1. In September 1877 Púkish, an elderly Indian, died after a very short illness on the western side of Upper Klamath Lake. The rumor that he had been bewitched and thereby feloniously killed by K̲ák̲ash, one of the conjurers who treated him, soon gained credence, and the excitement in the tribe ran high. The first account of the occurrence was obtained by one of the subchiefs, who, with his colleagues, passed sentence over the unfortunate K̲ák̲ash.

[192]
[193]
[551]
[769]

64, 1. hû't, "this one", forms one of the substitutes for names of deceased persons, which no Indian dares to pronounce. Hû't refers to a person standing visibly *before* the speaker, and it is remarkable that the dead are referred to by this pronoun, and not by a pronoun marking distance out of sight, like hûkt, hû'kta etc. Cf. hû't híshuaksh, 64, 9., gén, 64, 2., hû'nk pí'sh, 64, 5., 68, 11. etc. The subject nánka kukíaks does not exclude the use of the subject pronoun sha, *they*, the account being worded in the conversational style.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 683 [551] [756] 64, 1. Tetĕmádshish or Aunt Susie is one of the numerous female "doctors", who eke out a scanty living from some patients of the Klamath Lake tribe. She received the above name for having been a washerwoman to the soldiers stationed at Fort Klamath, and the nickname Wúya-ak was bestowed on her on account of her predilection for small sucker fish.

64, 2. sämtsálχa. The means employed by her to discover that Dr. John had cast upon the patient a spell of a deadly character, were the singing or recital of tamánuash songs, and the *dreams* which she had on that subject. Her tamánuash songs had *seen* those of the accused conjurer. See 65, 9. The great majority of the tribe still believes in the possibility of witchcraft.

64, 7. The two sentences contained in this line anticipate the result of the whole trial, and the popular verdict. The proper place for them would be after 65, 15.

64, 9. Tuá ni etc. The defense made by Dr. John in his own case is not an unable one, nor is it devoid of oratorical powers. But if the arguments were delivered in the order as given by Dave Hill, they ought to have followed each other in a more logical order to attain their full effect.

64, 10. wák lish etc. The logical connection existing between this sentence and the foregoing has to be supplied by: "why should he have been my personal enemy?"

[192] 64, 10, 11, 13 etc. i, ik stands here for ăt (*ye*); because, when the headchief is addressed in council, all the others are addressed also. Lóli stands for lóla i. The trial took place on Williamson River.

64, 13. kúkamtchish. The distributive form is used here instead of the absolute verbal k'mû'tchish, because old age comes on *gradually, by degrees.*

64, 16. tchi ínah instead of tchi nish; the language likes juxtaposition of two short equal vowels, even when a metathesis is required.

65, 8. Kátak etc. Aunt Susie's opinion, given just after Púkish's death and some time *before* the trial, did not fail to have a striking effect on the superstitious judges and tribe, for her arguments perfectly agree with the national ideas. But to us the arguments seem so weak, that no conviction seems justified, if not based on other evidence.

65, 9. nä'nsak etc. "Your defense does not disprove any of the points advanced against you."

[192] 65, 11. K'mukámtsam nä'-ulaks: "the old customs of the people."

[124] 65, 16. The second account of this tamánuash-case was obtained a few weeks after the trial; Dr. John was present at the agency buildings at the time of the dictation, furnishing the facts to my informant.

[697] 66, 4. ká-ishnank etc. This underground jail was in such an unhealthy condition that Dr. John could not have lived in it through the tenth part of his long term of imprisonment.

[625] 66, 5. Tchikéskni and Skélag, names of two watchmen (i-álhish); the chiefs appoint watchmen from time to time. Skélag is "the young weasel" and Tchikéskni "man living at Tchikési camping-place". They were armed with pistols to foil any attempt at escape.

[192] 66, 10. nä'dshek for nä'dsh ak: "the only one". Compare nádshiak, 60, 21; waítak, 56, 7. and *Notes.*

[192] [193] 66, 12. shishi'tilatk. The past participle often stands for forms of periphrastic conjugation: shishítilatko gi, they *were* carrying in their dress. Cf. illólatko, 55, 20.

*539
683
[192]
[193]

68, 13. gé'hlaptchapka. The verb gelápka means to step on, to mount, ascend; with 'h infixed, to mount upon something by using one's hands; ge'hláptcha is to perform this while on the way, while going or travelling; gé'hlaptchapka, to perform this at a distance from other people and unseen by them. Doctor John escaped, aided by his son, in the midnight hour.

68, 14. m'na únakam gatpĕnótash. Gatpĕnóta is a derivative of gátp'na with a durative signification, the suffix -óta pointing to an action performed while another is going on. "His son having arrived close by, while he was imprisoned."

68, 16. shnû'ntatka, verbal intentional of shnû'nta, the suffix -tka being sometimes substituted for the usual -tki, -tki gíug.

PUNISHMENT OF MANSLAUGHTER THROUGH WITCHCRAFT.

Obtained from "Sergeant" Morgan in the Klamath Lake Dialect.

Struck	(and) killed	they	the conjurer	for being bewitched (and)	having died	this	woman.

627

Tsúi	sa	lúluksla	snawédsh	kíuksam	síuks;	hû'nk	sa	kíuksas	ä'mpēle
And		cremated	the woman	by the conjurer	killed;	him	they	the conjurer	brought back

tchī'shtal,	tsúi	sa	lúluksla	mák̲laks.
to (his) lodge,	and		cremated (him)	the people.

NOTES.

68, 1 etc. This is a pretty good illustration of the method of doctoring by suction adopted in similar tamánuash cases. Persons sent out to call for the conjurer do not enter his cabin, but loudly halloo outside till he appears; in this instance he is supposed to sing his medicine songs amidst the solitary wilds of the mountain slopes.

192 177 68, 1. mû'ntchegī'tk. This temporal adverb places the mode of punishment described by the informant among the *ancient* customs of the people. Compared to what is stated here, the trial of Doctor John shows a material modification in the dealings with suspected conjurers, attributable to the influence of the white population.

192 193 68, 1. 10. salχita is always used in a passive signification, "to be afflicted with the tamánuash spell or bewitching power", which conjurers can send out at will.

68, 1. 2. The words inclosed in quotation marks *anticipate* all that follows up to 68, 10.

68, 2. 8. a-i. This particle has the signification: "undeniably, evidently".

754 68, 5. shû'ta hû'nk. The "working" of a conjurer on a patient's body consists in rubbing, pressing, magnetizing, in blowing on it, and in pouring water over the face or 753 other parts. Sucking out the object which caused the disease is of course the principal operation called for to effect a cure.

68, 5. mû'ns; it is not stated whether this hánshish was a frog, a worm, a small stick, or any such thing; this is immaterial, for the Indian strictly believes that the article was removed from the patient's body and that it caused the disease.

192 68, 6. hántsantking and 68, 8: shúkpaltakiug stand for hántchantki gíug and shukpalítki gíug; cf. shû'kpēli.

192 193 68, 6. hántchipka properly means: "he sucks towards himself"; husatchipgápēle "he throws up again to himself"; viz. into his mouth, so as to be able to take it out with his hands.

68, 7. lútatkish is the conjurer's assistant. His office is to repeat his tunes or speeches before those present in the lodge, to expound or explain his sayings, to start songs and tunes in his stead, and to perform such manipulations as mentioned here.

68, 8. k̲'lä'ksh, contracted from k̲'läkápkash, the dead, the deceased; k̲'lekápkash telshámpka, to be on the point of death.

192 68, 8. tchí-ulχa: he rises from his seat on the ground, or on a blanket near the patient's couch, for the purpose of leaving.

756 69, 1. hushtsóχa. The killing of a doctor or doctress by the relatives of the patient who died under his or her treatment was nothing unusual in the Columbia Basin until quite recently. In some tribes the third failure in curing brought certain death on the conjurer, especially when he had received his reward in advance.

*539 755 70, 2. í'lks (from élχa, ílχa, *to lay down*) is the full dish, basket, or bucket (kála), on which the victuals are brought in; but it means also the food itself, and the dance-feast on which they are eaten. Locative case: í'lksat.

[192] 70, 3. shuína is often incorrectly pronounced tauína.

[194] 70, 3. nutí'sh; verbally: while burning fivefold; while five fires are blazing.

70, 3. At tchí'sh: the young men, who strip themselves naked down to the hips during the performance, begin their dance after the women have had one turn.

[192] 70, 5. nä'bakuapk: see népka, in Dictionary.

[193] 70, 5. yayayá-as means a certain tamánuash witchcraft which inspires the conjurer: the conjurer tells the people just what (ná-ast) the yayayá-as said to him.

70, 6. 7. *s, sh* is here in three words doubled to *ss*: shíshalaluapka, shuashuáktcha, and wusóga; kû'tχaks forms the indirect object of the first of these verbs.

[192] 70, 7. wálok sápa. The kíuks gets the inspiration from the yayayá-as only after sweating; then he can tell (sápa) the people, *when* the disease will come.

70, 8. tánkĕni: after tánkĕni at í'lksh supply ítpa? (did ye bring in?).

70, 8. 9. shä'tu, sä'tu for the more usual form shä'tua; pä'n after tá-unepanta is incorrect and unnecessary; this conjunction should stand there only after ta-unépni or tá-unep.

NOTES.

*539 755 71, 1. shuákia does not mean "*to call on somebody*" generally, but only "*to call on the conjurer* or medicine man".

71, 2. wán stands for wánam ní'l: the fur or skin of a red or silver fox; kaníta pí'sh stands for kanítana látchash m'nálam: "outside of his lodge or cabin". The meaning of the sentence is: they raise their voices to call him out. Conjurers are in the habit of fastening a fox-skin outside of their lodges, as a business sign, and to let it dangle from a rod stuck out in an oblique direction.

71, 3. tchélya. During the treatment of a patient who stays in a winter-house, the lodge is often shut up at the top, and the people sit in a circle inside in utter darkness.

[193] [192] 71, 5. liukiámnank. The women and all who take a part in the chorus usually sit in a circle around the conjurer and his assistant; the suffix -mna indicates close proximity. Nadshä'shak qualifies the verb winóta.

[192] 71, 5. tchûtchtníshash. The distributive form of tchû'tʼna refers to each of the *various* manipulations performed by the conjurer on the patient.

71, 5. mä'shish, shortened from mäshípkash, mä'shipksh, like k'lä'ksh from k'läkápkash, 68, 8.

[193] [192] 71, 6. 7. There is a stylistic incongruity in using the distributive form only in kukuága (kúe, *frog*), káhaktok, and in nshendshkáne (nshekáni, ndshékani, tsékani, tchékëni, *small*), while inserting the absolute form in wishinkága (wíshink, *garter-snake*) and in kåko; mû'lkaga is more of a generic term and its distributive form is therefore not in use.

71, 7. káhaktok for ká-akt ak; ká-akt being the transposed distributive form kákat, of kát, which, what (pron. relat.).

[192] 71, 8. lgû'm. The application of remedial *drugs* is very unfrequent in this tribe; and this is one of the reasons why the term "conjurer" or "shaman" will prove to be a better name for the medicine man than that of "Indian doctor".

71, 9. kû'tash etc. The conjurer introduces a louse into the eye to make it eat up the protruding white portion of the sore eye.

KÁLAK.

THE RELAPSE.

[115] GIVEN IN THE KLAMATH LAKE DIALECT BY DAVE HILL.

Hä náyäns hissuáksas mä'shitk kálak, tsúi kíuks nä'-ulakta tchután-
When another man fell sick as a relapse. then the conjurer concludes to treat

uapkuk. Tchúi tchúta; tchúi yá-uks huk shlää kálak a gēk. Tchí huk
(him). And he treats; and remedy this finds out (that) relapsed he. Thus the

3 shuí'sh sápa. Tsúi nä'sh shuí'sh sáyuaks hû'mtcha kálak, tchúi nánuk hûk
song-remedy indicates. And one song-remedy having found out (that) of the kind of relapsed (he is), then all those

shuí'sh tpä'wa hû'nksht kaltchitchíkshash heshuampëlítki gíug. Tchúi
remedies indicate (that) him the spider (-remedy) would cure. Then

I	am informed;	many men		know,	(that) in this manner	were effected cures;	and he then

tsúshni	wä'mpĕle.
always	was well again.

NOTES.

[192]
[193]

72, 1. náyäns hissuáksas: another man than the conjurers of the tribe. The objective case shows that mä'shitk has to be regarded here as the participle of an impersonal verb: mā'sha-nûsh, and mā'sha nû, it ails me, I am sick.

72, 1. kálak, relapse. Relapse is not substantive, but adjective in the sense of a person having fallen back into the same disease by which he was afflicted before; kálkĕla, to fall sick.

[533]

72, 2. yá-uks is remedy in general, spiritual as well as material. Here a tamánuash song is meant by it, which, when sung by the conjurer, will furnish him the certainty if his patient is a relapse or not. There are several of these medicine-songs, but all of them (nánuk hû'k shuí'sh) when consulted point out the spider-medicine as the one to apply in this case. The spider's curing-instrument is that small piece of buckskin (ubá-ush) which has to be inserted under the patient's skin. It is called the spider's medicine because the spider-song is sung during its application. A spider-song in use among the Modocs is given below.

73, 5. hä'näshish appears as the subject of an incantation song in the song-list of Sergeant Morgan.

73, 5. gutä'ga. The whole operation is concealed from the eyes of spectators by a skin or blanket stretched over the patient and the hands of the operator.

73, 5. kiatéga. The buckskin piece has an oblong or longitudinal shape in most instances, and it is passed under the skin sideways and very gradually.

73, 7. tánkĕni ak waítash. Dave Hill gave as an approximate limit five days' time.

NOTES.

*539 221 This text intends to give a sketch of the various occupations of the northern tribe or Ê-ukshikni in every month of the year, and is partially worded in a form which may be called dramatic. These statements are not always arranged in logical order, but a profusion of ethnologic details gives intrinsic value to them.

[805] The months of the Máklaks year do not coincide with the months of our calendar, for they extend from one new moon to the next one, and therefore should be more properly called *moons* or *lunations*. Twelve and a half of them make up the year, and they are counted on the fingers of both hands. The first moon of their year begins on the first new moon after their return from the wókash-harvest at Klamath Marsh, which is the time when all the provisions and needful articles have been gathered in for the winter. [796] [224] Work is then stopped and the communal dances begin, the doctor-dances as well as those conducted by the chiefs, and everybody participates in them except those who are out hunting in the mountains during the latter part of the year. This mode of counting the moons on the digits was once popular, but on account of its imperfections it is now forgotten by the majority of the tribe. Instead of it they reckon time by the seasons in which natural products are harvested, as: udsakalí'mi, "in the big sucker time"; i-umi'mi, "in the berry season", or they use our calendar months.

The first moon mentioned in our text, gáptche, answers generally to our May. The two next moons are counted on the thumb and forefinger of the hand not used immediately before; with this last moon their year has come to an end. The next five moons are counted again on the digits of the first hand, and so forth. The half moon making up their full year is not accounted for in this text.

[823] [226] 74, 2. Ktai-Túpakshi is a locality of renown in the folklore of the Klamath tribe. It lies near the confluence of Sprague and Williamson Rivers, on the property of an Indian named Tchéloχins. The otilks is the fish-dam (from utíla), where the Indians wade in the water with their dip-nets and catch the fish while it ascends the river in spring-time in enormous quantities. This fish-dam does not reach the water's surface.

● [193] 74, 2. The direct object of lúela is kápto, its subject máklaks hŏ'ank.

74, 3. kámalsh pahá means: they dry the fish which they have just caught by exposing it to the sun on limbs of trees, and then make kámalsh by pounding it. Kámalsh is a derivative from gáma, to pound.

[192] 74, 3. kó-iχaga is identical with gújkaka; derived from kúi, "away, far off"; guiχátchka is: to start out annually to the prairies where roots etc. are harvested.

[262] [222] [251] [796] [222] [192] [415] 74, 5. saká a pŏ'ks: they eat *sometimes* the camass raw, but only at the time when digging it. Bulbs, roots, pods, chrysalids and berries are gathered by women only.

74, 6. pahá at p.; this is equivalent to pahátko pŏ'ks iwídshat. They bake the camass and put it in their cachés at the place where they intend to stay next winter.

74, 8. shníkanua. During the time when a pause is made in the gathering-process, the conjurer carefully watches the ripening of the pods not yet harvested and arranges public dances. When the sun has done its work, he solemnly announces it to the women, and they go to work again in their canoes.

74, 9. shiulína. From the preceding we should expect shiulínat, lulínat.

74, 10. wíllishik is the generic term for larger kinds of provision-sacks; it means here a sack of fifty pounds seed or grain, while the wáχoks holds hundred pounds. In pálasham-wáχoksh, however, the latter word is taken in its *generic* sense of sack, bag.

*539 221 [192] All these different kinds of sacks or bags were originally made of bulrush-stalks (tule) and the táyash was made of straw.

[415] 74, 11. k̲aítua nû kä'ila. The sense is incomplete. Probably sháyuakta is left out: "I do not know of any in the whole country", käila often standing for käilatat.

[192] 74, 14. áwalues. There are several islands in the shallow waters of the vast extent of Klamath Marsh, but only *one* is meant here.

[103] 74, 15. wō'ns ílktsat. They submerge their dug-outs at several places on the beach, where they are certain to find them in the next wókash-season.

[501] [103] 74, 17. pi'la wí'hla (or píla wíllash) contains perhaps a proper name of a locality, or stands in connection with Tóilkat, "at the Rail-Pyramid"; wílhaslash means top, apex. The stations from the "Ford" to "Bird's Lookout" are passed by the tribe when they return home with the lily-seed harvest-crop. "They drop the rifle" is: they take a rest. All these localities are either on the open waters of Klamath Marsh or on Williamson River, which forms its outlet.

[484] [492] 75, 1. iwí-idaha wókash. The distance between Klamath Marsh and the Williamson River is from 20 to 25 miles, and horses carrying wókash can make it in one day. The next day they return to carry another load.

[482] 75, 2. nátoks waítuapk: we will lie over one day to let our horses rest, or recover from the swellings on their backs. Nátoks stands for nát toks.

[829] 75, 5. klá-eds is probably a kind of wild prunes. See Dictionary: kēlátch.

[192] 75, 8. wídaika íwam. "Some are economical with their own berries, and prefer not to scatter them in the hands of others"; íwam, huckleberry, has become the generic term for all berries, and i-umä'mi is "*berry-season*".

[316] 75, 11. spû'klish here means the large communal sweat-house; it is used frequently for dances and kshiuwálχishtat, contr. kshiû'lχishtat might stand instead of spúklishtat.

75, 11. papiä'na, vocalic dissimilation for papa-éna; derived from pán, to eat.

[193] 75, 13. atí'sh etc. "Heap ye up that hay in two stacks, which must have a lengthy, long-stretching, and not a high, cone-shaped form!" For heaping up long stacks one verb is here used, and another for making the high, round ones.

Pû'LAM SHUMSHE-ÉLSHTAT SHASHAPKĒLÉASH.

A SKETCH OF BALL'S MARRIED LIFE.

[115]

GIVEN BY DAVE HILL, SUBCHIEF, IN THE KLAMATH LAKE DIALECT.

*539 593 Póluk k̲ä'liak snáwäds t'shín. Tsúi snawä'dshla Pámpiam pä'-ia lupí';
Ball he without a wife grew up. Then he married Pámpi's daughter at first;

chase each other	to the bases	they	then.

NOTES.

[193]
[192]

I. The game described in this paragraph is played with four shúlshesh-sticks. From this term is formed a denominative verb, shulshéshla: to play the stick-game. It is a guessing game, and the guesses are made known by putting fingers forward, a gesture which is called spélshna. Hence spélshna, sometimes corrupted into spéldshna, is used as a term equivalent to shulshéshla, to play the stick-game; and a third verb for this pastime is shákalsha. More minute descriptions of the three games will follow elsewhere.

79, 1. shî-i'χaga is the reciprocal form of î'χaga *to win, gain*, occurring below. These terms mainly refer to gains made in gambling.

79, 2. shulshéshlank stands here for the periphrastic shulshéshlank gi, or the simple shulshéshla. Derived from shúlshesh, and this from shúla, to hand over, to pass to another.

79, 2. sχú'tash, not to be confounded with skútash, *blanket*, forms apposition to lápi ndshekáne. The two slender game-sticks are wrapped in narrow strips of buckskin leather (skúta, to wrap in).

*539
525
192
193

79, 3. sχétcha, to extend two fingers, viz. the index and the middle finger; the instrumental case of the verbal substantive, sχétchashtka: by extending these two fingers.

79, 3. shlín, to shoot, to shoot forward, to hit; figuratively used for the rapid motion of the hand in guessing at the location of the sticks lying under the tray or pá'hla. yû'shakna, yúshkĕna, or yû'sχa, to put forward, to use the index finger. In this game that finger is called yû'shχish, and not by its usual name, spéluish.

79, 4. vû'ish is the location of the thicker sticks coupled on one side, and of the thinner ones on the other; the gesture for guessing at it is to make a side motion with the hand, thumb included. In the text, the sense would become clearer by wording it thus: vû'ish sha népatka tχopowátka tch lénank shlín, "they guess at the vúish, whirling around with the hand, thumb included." Léna is to perform a circular motion; klátchna, a side motion.

79, 5. sχétchashtka sha láp wí-uka. Sχétchashtka collides here apparently with yû'shχish spélshisht; it seems to stand for: "they win two checks, if they have guessed right at the slender sticks".

79, 5. wí-uka. They win one (nā'shak) of the six checks or counting-sticks, if the party opposite did not guess correctly.

II. To play at dropping beavers' teeth (shḵû'sha) is the subject of this paragraph; the game itself is sḵúshash. The four teeth of the beaver are marked for this game by the incision of parallel lines or crosses on one side, and a small piece of woolen or other cloth is inserted into the hollow to prevent breaks in falling. The two longer or upper teeth of the beaver are called the *male* (laḵí), the pair of lower and shorter the *female* teeth (gúlo, kúlu; distributive form: kúkalu). The teeth are dropped on a hard, level substance, as a metate or grinding stone, to make them lie flat. The marked side of the teeth wins, if it is turned up after dropping. The teeth of the woodchuck (mú-i, móí) serve for the same purpose.

80, 2. Shúshmalua=kípksh stands for shúshmaluash=gípshtka or =gípkashtka, the instrumental case of the participle gítko, possessed of: "(if they fall down) on that side, where each is possessed of marks" (shúmaluash).

80, 2–4. kshĕ'sh. In this game of beavers' teeth (púmam tút), or woodchucks' teeth (múyam tút) they use twelve check-sticks to count their gains with. The game is played by two persons, or by two partners on each side.

80, 5. Kshawínasht tûksh. Kshawína means several teeth to fall down, but, as the prefix ksh- indicates, only *one* tooth with the marked or winning side up.

III. The tchimmá-ash game is played almost exclusively by females. The tchimmá-ash is a string about 2–3 feet long, to the ends of which sticks or pieces of cloth are tied; it is taken up and thrown forward by two flexible willow rods (shuékûsh, wá'hlkish) to playmates, who divide themselves into two parties. Before the commencement of the game, two limits (yúash) are meted out on the ground, which serve as bases. Both of them are located between the lines of starting (shalχuétgish).

80, 7. shuékûsh: *two* poles; players hold one of them in each hand.

80, 9. Kawû'tank refers to the playmates of the opposite party, who are bound to catch the flying tchimmá-ash.

80, 11. shiwákuash seems to be a dissimilation of shiwáka-ash.

80, 11. kíudshna léna, or better: kíudshnank léna.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 the ground, both ends being bent over. The process gone through while sweating is
343 the same in both kinds of lodges, with the only difference as to time. The ceremonies
515 mentioned 82, 4–13., all refer to sweating in the mourners' sweat-lodges. The suda-
765 tories of the Oregonians have no analogy with the *estufas* of the Pueblo Indians of
● [193] New Mexico, as far as their construction is concerned. Cf. *Notes* to 70, 1. 75, 11.

[192] 82, 1. lápa spû'klish, two sweat-lodges, stands for two *kinds* of sweat-lodges.

82, 5. shashámoks-lólatko forms *one* compound word: one who, or: those who have lost relatives by death; cf. ptísh-lûlsh, pgísh-lûlsh; hishuákga ptísh-lúlatk, male orphan whose father has died. In the same manner, k̲ĕlekátko stands here as a participle referring simultaneously to híshuaksh and to snáwedsh wénuitk, and can be rendered by "*bereaved*". Shashámoks, distr. form of shá-amoks, is often pronounced sheshámaks. Túmi etc. means, that many others accompany to the sweat-lodge, into which about six persons can crowd themselves, bereaved husbands, wives or parents, because the deceased were related to them. Cf. lĕ'pk̲'leχa, lĕ'pk̲'lekatko.

82, 6. Shiúlakiank etc. For developing steam the natives collect only such stones for heating as are neither too large nor too small; a medium size seeming most appropriate for concentrating the largest amount of heat. The old sweat-lodges are surrounded with large accumulations of stones which, to judge from their blackened exterior, have served the purpose of generating steam; they weigh not over 3 to 5 pounds in the average, and in the vicinity travelers discover many small cairns, not over four feet high, and others lying in ruins. The shrubbery around the sudatory is in many localities tied up with willow wisps and ropes.

82, 10. Spukli-uápka mä'ntch means that the sweating-process is repeated many times during the five days of observance; they sweat at least twice a day.

NOTES.

[178] The ascetic performances and ceremonies here described are going into disuse at the present time. When they were fully observed, the bereaved husband wandered alone through the woods and wilds (spótu) for five days, but to the widow these observances extended over a shorter time. For this purpose both sexes wore warm clothing, but took to worn-out blankets or old articles of raiment, and used wisps of the serviceberry-bush as belts.

[192] [526] 83, 1. shpótû: strong and unusual bodily exercise, running up hill, plunging etc. was and is still considered beneficial to the body, and is much in favor with the Indians. Cf. 82, 10. 11.

[192] [193] 83, 1. hissuáksûk for híshuaksh ak; the husband *alone*, not in company of others; pä'nĕ for pä'n a, pēn a, cf. átĕnen for át a nen; and sĕ for sha, they, 82, 4.

83, 2. ka-ítua pát or p'át: he eats nothing at the time while wandering; pánk, p'ánk might stand here instead of pát; tû'tahna: for dozing they did not lie down, but tried to catch a little sleep while walking and wandering.

83, 2. shlaá, and tchákĕle 83, 5, forms sometimes used in conversation instead of shläá, shleá; tchä'kĕle, tchékĕli. Cf. yáka for yä'ka, yéka: *Note* to 16, 10.

83, 3. hûshti'ktamna; the suffix -tamna shows that pahín stands for nánuk pahí'n gí'sh: "nightly, every night."

83, 4. siunō'tish and shuí'sh are both tamánuash-songs, but of a different character. See Dictionary. Shlä'popka: he sees in his dreams what he has heard mentioned in the songs. To sing or repeat songs started by the conjurer devolves almost exclusively on the women present at the ceremony.

83, 5. súmat: into the mouth; their blood, disturbed by the constant excitement produced by the night rambles, ascends to the throat, and is sometimes spit out by them.

84, 2. shuashuáktchish. By their loud and noisy lamentations (shuáktcha, to cry, to weep) they expect to avert from the bereaved husband the effects of the tamánuash-spell (shuí'sh) which he has seen in his dreams.

84, 2. matchátgish: those listening to the words uttered by the conjurer and his repeater or expounder; they are of both sexes and also act as bewailers.

*539 tsúi sha shiū'lgip'l tsóχapksh, tsúi sa ánkuala tû'm, tsúi sa kshû'iwal lû'-
766 Then they collected the fallen, and they cut limbs (of trees) many, and they laid on the pyre to

Túnipni spúkĕli, k'lä'wi at; at gä'mbĕle, kiä'm pán. At gä'tak.
Five (days) she sweated, stopped then; and returned home, (and) fish ate. That's the end.

NOTES.

726
825
The style of this little piece is far from what we would call accomplished, and of incongruencies and unnecessary repetitions there are a score. The fight in which the five warriors were killed is imputed to the presaging, night-long cry of an ear-owl, and in ancient times Indians seem to have been justified by universal custom in attacking and killing their neighbors if an owl or raven was vociferating at night in close proximity to the lodge or lodges of these unfortunate people.

192
193
88, 7. hushtsóχok for hushtsóχa hûk.

88, 9. 10. hushtsóχa is used here in an active sense, but is better translated by the passive form.

89, 1. kshúiwala has for direct object tsóχapksh, the dead body. For the same operation the verb ksháwala, ksháwal is also frequently used: 85, 6. From here the informant begins to speak of *one* body only, as if only one warrior, not many, had been killed in this battle. Cf. *Note* to 89, 5.

89, 2. húnkĕlam stands in this line for hunkĕlámsham or p'nálam: "their, theirs".

89, 5. lák. After their return they cut off the hair of the widow and then she put pitch or resin on the head. In most tribes they did it *at the time* of cremation, while they witnessed the action of the flames upon the body.

89, 5. hûk snáwedsh: one widowed wife only is mentioned here instead of many: "*pars pro toto*"-construction. This sentence, if built regularly, would run as follows: shishásbka sha lák hû'nkĕlam snawédshash, kát hûk wenóya; hissuákshash m'na k'léksht wenóya.

89, 7. spû'kĕli, to sweat in the sweat-lodge, viz. in one of the three sweat-lodges given by K'múkamtch to the Klamath Lake people: spû'klitcha, spû'klidsha, to start out for sweating there. Cf. lumkóka and wála. To eat fish only, and no meat, means *to fast* on fish.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539
829
192
193
439

93, 1. k̲á-i spûní vushúk: the subject of spûní, É-ukskni mák̲laks, is left out by inadvertence. Some Wascoes wanted to marry into another tribe; for "one Wasco man" stands here for "some men of the Wasco people."

93, 3. 4. Ampχä'ni, contraction of ambuχĕ'ni "thither, where the water is", where the waters rush down in a cataract, or in rapids. The rapids of the Columbia River at the Dalles impede navigation.

93, 7. sasságank 1 gi! ye are in peril, when going to the Dalles and being Indians, therefore take care of yourselves! 1 stands for ät; cf. 64, 10 and *Note;* 90, 13. 14.

93, 7. 9. Instead of k̲á-i nû shtínta may be said also, in this connection, k̲á-i nû shanáhole; instead of tánkt ni gĕnt: gĕ'ntĕni, gĕ'nt a ni; instead of Tídshi hä'k: tídshäk, tídshi hä gi.

K'MUKÁMTCHAM AÍSHISHAM TCHÎSH SHASHAPKĔLÉASH.

NOTES.

This is one of the most popular myths current among the É-ukishikni, and we shall find it partially repeated in another myth, recounted by Dave Hill. Aíshish and his father K'mukámtchiksh represent powers of nature engaged in everlasting strife for mutual extermination. In this myth K'múkamtch resorts to the following trick to destroy his offspring. Seeing young larks in a nest on the top of a sorrel-stalk, he informs him, that if he climbs up there, he can obtain a nest of eagles with all its inmates. Gladdened with the prospect of this capture, Aíshish climbs up, but the insidious father causes the plant to grow miraculously fast under him, so that descent becomes impossible, and Aíshish comes near perishing by hunger and exposure.

In the recollection and wording of some portions of the myth my informant was assisted by "Captain Jim."

94, 1–7. The short fragment of a creation myth preceding the Aíshish tale stands in no causal connection with it, and could as well be inserted elsewhere. Myths entering upon the *details* of the creation of the world by K'mukámtchiksh do not, as far as ascertained, exist among this people, but in their stead we have many myths for special creations (of man, animals, islands, mountains etc.). A grammatic analysis of the terms occurring in this fragment (from Lûpí nă'lsh to pátki gi) was inserted by me in the *American Antiquarian*, Vol. I, No. 3, pages 161–166, under the heading: "Mythologic Text in the Klamath Language of Southern Oregon."

192 94, 1. Lûpí shutăyéga is not to be considered as a repetition, for it means: when
193 K'múkamtch began to create the world he made *us* before he made the fish, other
animals, and the dam at Linkville. This is, of course, only a small fragment of all the
creation myths of this people.

94, 2. shashapkĕlía: to tell or count stories, myths or fables in the interest or for the pleasure of somebody; the i is here doubled to obtain a rhetorical effect.

94, 3. K'mú'kamtchish is a contraction of K'mû'kamtch tchish; Aíshish, K'múkamtch also. The longer form of the name of the deity occurs 95, 20.

94, 3. ká-akt, metathetically for kákat; kát is pron. relat. which, what, the thing which. nánuktua ká-akt găg comprehends all animate and inanimate creation.

94, 4. wá, uá, to stay, exist, live in; is always connected with an indirect object indicating the place, spot, locality or medium where the subject lives or exists.

94, 4–6. The construction of the sentence runs as follows: Tchúyunk (K'mukámtch)
né-ulχa gí'tki gíug páplishash I-ulalónan, páltki tí'wish gint ndûlshámpkash mû' nḵil-
lipkash, mû'ash shlé-uyuk; "when a south wind blows, it will stop the waters from
133 rushing down rapidly over the cataract." The outlet of Upper Klamath Lake, called
132 Link River, runs from north to south, over the falls at Linkville; hence a powerful
226 south wind will stem the current of Link River above the falls, leave its bottom dry or
almost dry, and enable the Indians to catch the fish swimming in the shallow water
or wriggling in the mud. The rocky ledge under the cataract is supposed to be the
gift of K'múkamtch.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 94, 4. I-ulalónan or Yulalóna is the Indian name of the cascade of Link River
773 above the town of Linkville, and for that town itself. The origin of this name is ex-
192 plained in 94, 5. 6, for the verb i-ulalóna means to move forth and back, referring here
193 to the waters of the river receding under the pressure of the south wind.
[103] 94, 6. ítklank, partic. pres. of ítkal, means here: obtaining by basketfuls.
[137] 94, 9. The kĕnáwat is a plant growing high in the warm climate of Northern California, especially in the ancient habitat of the Shasti Indians, and in this myth it suggested itself to the Indians on account of its property of growing very fast.

95, 5. gé'hlapka: he swung himself into the nest by climbing over the rim. Cf. *Note* to 66, 13.

95, 10. kaiʒema K'mukámtchish for the regular form K'mukámtchash. Cf. 91, 8.

95, 13. skáyamtch etc. More plainly expressed this sentence runs as follows: sha skáyamna pásh tchish ámbu tchish; the first tchish being placed before pásh and appended to the apocopated skáyamna.

95, 16. shéwana here used differently from tchíya, which applies to liquids only.

95, 17. p'lû' ítchuank seems to be a quite modern interpolation, for it smells of pomade and hair-oil; but it is as ancient as the myth itself.

[765] 95, 23. 96, 2. 3. 4. Tchíka. I have rendered this bird-name elsewhere by "Chaffinch," and Klétish by "Sandhill Crane".

[551] 96, 3. shlámia, to feel insulted. She resented it as an insult that the child called her deceased husband by name; for it was a capital crime among the ancestors of the present Klamaths to call a dead person's name for many years after his demise.

96, 5. hû'tna is changed to hû'tan on account of being followed by a word commencing with k.

[765] 96, 6. stíya. The custom of widows to put pitch or resin on their heads at the death of their husbands was abolished only at the time when cremation became a thing of the past.

[178] 96, 6. galdsha-ńyank is a more explicit form of the participle; the verb gáldshui being the contracted form of galdsháwi.

96, 8. yámnashla. He used the bristles of porcupines to make necklaces of.

96, 11. unakáka m'na was the son of Aíshish and of the above mentioned Tchíka.

96, 11. 12. K'mukámtcham qualifies pā'ks, not lúlukshtat.

96, 14. pakakóleshtka, verbal desiderative of pakakóla, to jerk away from. The suffix -óla indicates that K'múkamtch wore his tobacco-pipe tied to his body; he wore it on his neck.

96, 15. tchítchiks is used when speaking to children. It signifies *so, so!* and means: be quiet, shut up, stop!

96, 17. tchē'k kēléwi. In similar connections this phrase very frequently ends a whole narrative in Modoc and Klamath. Here it means that Aíshish ceased to poke the pipe into the fire. Cf. 85, 10. 89, 7.

96, 18. medshá: he removed from that spot with all his wives and children. Ancient customs forbid the offspring to stay where the father had breathed his last.

96, 20. Gén húnk nánuk etc. This portion of the myth describes the destruction of all the living organisms on earth by a general conflagration caused by K'múkamtch. Myths of this kind are suggested by intense heat experienced in summer. This mode of destroying life on earth is less frequently met with in myths than the drowning in a general flood.

*539
773
192
193

96, 21. kíuyäga. Aíshish held the tray over himself, his whole family, and his lodge. The same prefix ki- reappears in a nasalized form in ngí'-ulliga: 97, 1. It is nasalized there on account of the preceding -k in hû'uk.

96, 23. kiüla. Where I have rendered this term by "world", as here and elsewhere in creation myths and myths of a similar character, it does not signify the whole surface of the earth as known to us, but only that section of country which is known to that tribe of Indians. Thus ancient creation myths only describe the creation of that part of country where these myths originated; the creation myths of coast tribes will include the ocean in their term for "world".

825

96, 23. Túhush talpatkóla. Mud Hen, one of Aíshish's five wives, looked out from under the roof of Aíshish's lodge or shed to see what was going on. This fiction explains the round dark spot visible on the mud-hen's head; its *round* form is indicated by the prefix la- in laliga.

Aíshisham shashapkéléash.

A MYTHIC TALE ABOUT AÍSHISH.

GIVEN BY DAVE HILL IN THE KLAMATH LAKE DIALECT.

Shashapkēle-uápkan Aíshishash:
I am going to tell a story about Aíshish:

Aíshish mat sákla tû'ma mák̲laks íyamnatko; shuédshnuk mat sha
Aíshish, they say, gambled many people having with him; when gambling on their way, so they say, they

shnéna lû'loks. Yámnashptchi mat lû'loks Aíshisham, Wanákalam kükü'kli
built fires. Purple-Lilac (was), as reported, the fire of Aíshish, of Silver Fox yellow

lû'loks, K'múkamtcham shláyaksak. Tsúi sa slō'kla; Aíshish shlín tálaak,
the fire (was), of K'múkamtch (it was) smoke only. Then they shot at the mark; Aíshish hit (it) straight,

Wanáka yû'tlansna. K'mukámts tû' hak yû'l'ka, nánka toks tû' hak a-áti
Little Silver Fox missed the mark. K'múkamtch this side of mark struck, the others but far this side of the mark

hak yû'l'ka; tuí sa húmasht gíulank sákaliäga. Túm sa héshkû, tsúi sas
struck; right then they after so doing commenced gambling. Many things they bet on, then over them

Aíshish í'kak; séwatkashtka nánuk wátchpka, tsúi sa gä'mpēle. At tû'
Aíshish won; about noon all men had lost all they had, then they went home. Ever

tsússak í'χak nánuk sas.
since he won them all.

Tû'nipnish wéwan's gitk Aíshish: Tûhû'sh násh snáweds Aíshisham,
Five wives had Aíshish: Mud Hen (was) one wife of Aíshish,

Stókua násh snáwedsh, Klí'tish násh, Wä'ks násh, Tsí'ka násh snáwedsh.
Long-tail Squirrel one wife, Sand-hill Crane one, Mallard one, Chaffinch one wife.

NOTES.

[372]
[484]

Portions of the same myth, though differently connected, will be found in the mythic tale: K'múkamtch attempts the destruction of his son Aishish. Both narratives are complementary to each other in some important details.

99, 3. **shnéna.** It is the custom of gamblers to build fires at every place where they stop on their road or trail. Any party of travelling Indians will do so when stopping on their way. Cf. 23, 15.

99, 3. **Yámnashptchi.** Several adjectives designating colors are taken from articles of dress in both dialects: tolalúptchi, green; tchχé-utchχe-ushptchi, a shade of blue; and spálptchi, light-yellow, is called after a face-paint made of a kind of clay.

[825] 99, 3. **Wanákalam lû'loka.** The fire of Young Silver Fox was yellow or yellowish, not only because the fur of this fox-species turns from silvery white into yellowish by the change of seasons, but also, because this animal represents in mythic stories the halo around the sun. Cf. shakatchálish in Dictionary. Wanáka always figures as the companion of the principal national deity, K'múkamtch.

99, 7. **wátchpka:** to stake everything in one's possession and then lose it all; wí-uka, to win all the stakes lost by the others.

99, 10. 100, 5. **Stókua** or Stúkuaga was, according to another of my informants, a fish of this name, and not a squirrel. The other wives of Aishish all have names of birds.

100, 3. **huélks:** K'múkamtch had inherited a locality where his father was in the habit of hunting and killing the giant-eagle (p'laíwash). Thinking of this place, K'mukámtch went there with his son Aishish, after scheming a stratagem to let him perish there. To kill the eagles, it was necessary to climb a pine-tree; this K'múkamtch was afraid of doing, and wanted to send up there his son instead.

100, 9. **shnúlas toks etc.** The lark had her young in the nest of an eagle.

100, 10. **sûlû'tantsa.** He dressed himself in Aishish's garments, as appears from the foregoing mythic tale.

100, 15. **saa.** Dave Hill often uses shash, sas in an almost reciprocal sense: while (or: for) going to gamble among themselves. This pronoun does not depend here on shnéna, as we might assume. Cf. *Note* to 58, 10. It refers to the playmates of Aishish, who set out with K'múkamtch, whom they thought to be their beloved Aishish on account of the dress he had abstracted from him. In 100, 14 shash was explained to me by "from them", viz. from the wives of Aishish, in whose lodge K'múkamtch had passed the night.

100, 18. **gä'pkat for gépka at:** did not come now, or: has not come yet.

101, 2. **gä'tak.** This adverb gives to understand, that they were loth or too tired to play any longer for stakes, because their beloved Aishish was not present. "To cease or stop gambling" simply, would be expressed by saklóla.

101, 4. **shti'a etc.** Cf. *Notes* to 89, 5; 96, 6; and general *Note*, on page 86.

[193] 101, 4. **shi'dsho wenépi,** rather unusual forms for shi'dsha hû vunépni. Hû, "up, above, on head," has coalesced with shi'dsha into one word.

101, 5. **Klíti'sam.** Aishish heard the cries of Klétish only, because of all the birds which are believed to be his wives, the long-necked sandhill crane is the loudest and noisiest.

[825] 101, 8. **gatpampêlissa for gatpámpêli sha, as tchíssa for tchí sa.**

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 101, 8. p'tisá m'na for p'tisha m'nálam.

773 101, 10. ka̱kó bēlat for: ka̱kó pil at.

192 101, 11. p'tissap sam. Sham, sam "their", is found standing instead of m'nálam,
193 p'nálam, or húnkēlamsham in the conversational form of language. Cf. 107, 13. 100, 4.

101, 13. liwátkal. They lifted up the famished Aishish, almost reduced to a skeleton, and seated him upright in the nest; they imparted new strength and life to him by feeding him.

101, 16. ke̱dsha, to grow, forms ke̱dshua, ke̱dshnúta; n's is: nû'sh, to me, with me, under me; a sort of *dativus commodi.*

ORIGIN OF HUMAN RACES. DURATION OF HUMAN LIFE.

[115]

GIVEN BY "CAPTAIN JIM" IN THE KLAMATH LAKE DIALECT.

K'mû'kamtch hû'nk at né-ulχa ná-asht gén: Hû'nk E-ukshikíshash
K'múkamtch ruled as follows: The Klamath Lake

tchák mák̲laks shû'ta; tchúi pén K̲ä'k̲ak̲ilsh tchágsh mák̲laks shû'ta;
from a service-berry bush people he made; hereupon the Kä'kakilsh from skunks people made;

yámatală génûta shûshtédshna. E-ukshkíshash ktchálχishtat í'lχa, Bósh-
northwards while he had gone he created (them) on his way. The Klamath Lakes in the sun-heat he laid down, the white

tinash toks shûtólank máhieshtat í'lχa; húmasht gíug nä'd mák̲laks mû'-
people however after creating (them) in the shade laid down; therefore we Indians (are)

makmûkli, Bóshtin toksh papálpali. É-ush guní'gshta käilalí'a.
dark, the white race but light-complexioned. The sea beyond he made a world for them.

At sha pä'n ne-ulakiéga, K'múkamtch mû'nk tchí'sh shkíshkí'sh tchish
Then they began to legislate, K'múkamtch, mole also, fly-bug also,

wishí'nk tchish. Mû'nk hämé̱χe: "Nû a gû'ggamtchíshash mák̲lakshash
garter-snake also. Mole said: "I of old age the human beings

gí'tki gí!" Húnkanti wíshink ná-asht häméχe: "nû'toks gémptcha
to become want!" On that subject garter-snake thus spoke: "and I thus-made

mák̲lakshash gí'tki gí!" Tchíhunk wí'shink shkintchishχagóta: "gá-ash
the men to become order!" Thus garter-snake while shedding its skin: "this way

nû hû'nk mák̲lakshash k̲'léktgi: tí'dshok nétnäk gít k'mû'tchatk gíntak
I the men to become (want): having grown then to be of old age though

tchíltgipēletám'nûk." Húnkanti mû'nk ná-asht heméχe: "nû a gémptcha
always to grow young again." On that subject mole thus said: "but I thus-made

pshe-utíwashash gí'tki gí: gû'ggamtchishash!" Pí muimû'yuk: "gá-asht
the human beings to become want: decrepit by age!" (And) it shivering (said): "thus

nû pse-utíwashash gí'tki gí!" Skí'shkish tchish ná-asht tok nä'-ulχa
I the human beings to become want!" Fly-bug also thus voted

*539

beings among when stepping (on me) (will) crush me".

Tchí'hunk pä't háshtaltal né-ûlχûg. Tchúi sha pälpeliéga; mû'nk
Thus they mutually disputed for action. Then they began working; the mole
yaína shuteyéga; shtû'ya yaínaluk. At pí'pil húnta né-ulχa K'mukám-
mountains began to make; it made gang-ways to throw up mountains. Now alone thus (it) made after K'múkamtch
tchăm shutólash.
had finished creating.

NOTES.

*539
773
192
829

103, 3. tchák. There is evidently a *jeu de mots* intended between tchák and tcháksh. Which northern tribe the Käkakilsh were, my informant and other Indians were unable to say; it is a nickname, derived from k̲ä'k̲, of some Oregonian tribe held in contempt by the Mák̲laks, and any reference to it causes great merriment to the Klamath Lake Indians. Mák̲laks is in both places separated from the tribal name by inversion; tchák and tchágsh form apposition to these tribal names and to mák̲laks, and for tchágsh we would expect tcháshish, which is the usual form of the word.

103, 5. É-ush. The sea or ocean, which is meant here, is múni é-ush, while é-ush means a lake, lagoon or large pond.

103, 6. ne-ulakiéga. Three of the lower animals are here brought together to confer with K'múkamtch to determine the duration of man's life, and every one voted according to its own experience. Stephen Powers mentions a mythic story comparable to this, heard by him among the Pit River Indians (Contrib. to North Amer. Ethnology, vol. III, p. 273): "The coyote and the fox participated in the creation of men and animals, the first being an evil spirit, the other good. They quarreled as to *whether they should let men live always* or *not*. The coyote said: "if they want to die, let them die"; but the fox said: "if they want to come back, let them come back." But nobody ever came back, for the coyote prevailed."

103, 9. 10. After shkintchishχagóta supply heméχe, and after k̲'léktgi: gi.

[193] **103, 10. tí'dsok,** or tit'shok, distributive form of t'shók, of the verb t'shin to grow. Cf. tit'sha, 107, 12.

103, 12. pshe-utíwash, abbreviated pshé-utuash, an archaic word used only in the *collective* sense of people, human beings. It occurs only in mythic stories. Cf. 105, 8.

104, 4. shtû'ya. This fiction was suggested by the manner in which moles throw up mole-hills and shows that the ancient myth-makers were not without a humoristic vein.

104, 4. pí'pil. Every mountain was thrown up by the mole alone, each one separately. The special creation of K'múkamtch was *man*, and whatsoever stands in direct connection with his existence, welfare and customs, as fishing-places, islands, funereal sweat-lodges etc.

104, 4. húnta, abbreviation of húntala: by proceeding in *this* manner, in the *same* manner.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

NOTES.

*539 In preference to any other beast, the prairie-wolf, small wolf, or coyote (as he is
773 called in the West after an Aztec term meaning "digger, burrower") became con-
[825] nected in the mind of the Indian with the creation of the moon and the origin of the
months or moons, because in moonlit nights he is heard howling from nightfall to
dawn; sometimes alone, sometimes in packs of several dozen at a time. His querulous,
whining howl is likened by the Indians with a "speaking to the moon". Our tale
above is based upon the double sense of *moon* and *month*, in which the term shápash (the
"indicator," from shápa to tell, indicate) is used. The idea of the creation of twice
twelve moons originated in the delusion that in every period called *new* moon, moons
were really made or manufactured *new* by the creator. The number twenty-four was
perhaps suggested by the observation of lunar eclipses, or mock moons appearing in
hazy weather. The coyote as the creator of the moons (and the creator of the universe
among the Central Californians) naturally desired to have as many moons as possible;
while K'múkamtch, as the wolf's antagonist, thought it better for the benefit of his own
*539 creation, the human beings, not to make the year too long. If the winter had to last
773 twelve months instead of six, how could they collect roots, bulbs, seed, fish, and game
192 enough to live through such a length of time?

105, 2. shipátχûkanka. Two moons being on the sky simultaneously would necessarily often cover and thereby eclipse or hurt each other.

105, 2. iggá-idshnank. The mother-coyote had hung up the twenty-four moons made by herself around the walls and ceiling of her winter-lodge, which in this myth signifies the sky. The suffix -ídshna points to her walking from one spot of the lodge to another while busy in suspending the moons.

[776] 105, 3. gû'hli'. A great deal of shrewdness is ascribed to the principal deity of the Klamath Lake people as well as to those of other *hunting* tribes. He manifests his astuteness in entering the coyote's lodge in her *absence* only, and to prepare a trick for her there.

105, 4. tát' né for táta nen.

[194] 105, 5. Hitá tchía! is pronounced as if it was *one* word only: hitátchia.

105, 6. shû'shamka, distributive form of sh'û'mka, to hum, grunt, to make hã hã. He grunted every time he planted another awl, sometimes in an interrogative tone of voice, and did it to disguise their secret planting into the ground.

105, 7. wákaitch composed of wák haitch; wásha-wéka composed of wásham wéaga; tχéwag or tχéwaga, diminutive of tχé-u first, first in order, eldest; cf. hû'ktag.

[193] 105, 7. tû'm haktch. This language has a term corresponding to our *too much* (tû'm tchátchui), but none which renders our *too* with accuracy. Adjectives or adverbs qualified by *too* are therefore pronounced with a higher pitch of voice and the quantity of their main vowel is increased when the Indian intends to express this adverb.

105, 10. wakaí, "why not," a combination of wák and ḳá-i.

105, 14. gatpanû'la gi'ta: he has come here and has left again.

[825] 105, 16. Kiti'ta. The coyote-wolf, while rolling forth and back on the ground, as these animals are in the habit of doing, ran her belly into the bone-awls insidiously planted there by K'múkamtch, so that the entrails shed their contents on the lodge-floor.

NOTES.

Compare with this myth the first part of the "Mythic Tale of Old Marten" (Skélamtcham shashapkĕléash), which contains the same subject-matter.

[103] 107, 1. Yámsi, contraction of Yámashi. This is the name given at present to a mountain North of Klamath Marsh; from this direction the cold winds (yámash) blow over the highlands on Upper Klamath Lake.

*539
773 107, 1. 3. 9. Tchášhgai sometimes occurs in the diminutive form Tchashgáyak, because the Weasel is regarded as the *younger* brother of the Marten.

192
193 107, 2. saikän, a contraction of saigaχĕ'ni: they went *to* the prairie, where the women were digging the edible roots.

107, 3. Skĕ'lamts. I have given this myth elsewhere in a longer relation, where the part played here by K'múkamtch is played by Skélamtch. Even in Dave Hill's relation the Marten is called, but once only, by its real name Skélamtch; K'múkamtch and Skélamtch are mentioned *here* as identical. The term skĕ'l, when not employed in its mythologic sense, means a long piece or strip of tanned otter or marten skin, used for tying the hair, or for other purposes.

107, 3. 4. I'ktchatki snáweds etc. One woman only is mentioned here, instead of the two, whom Weaslet was ordered to bring home as wives for his brother K'múkamtch and himself.

107, 5. wéwans a very common elision for wéwannish.

107, 9. kaní ná-asht? ellipse for kaní ná-asht gi?

107, 10. nû ä'pkolatkik. Instead of this may be said also, ä'pkatki gínla nû: "I strictly told (you) to bring in."

107, 13. sa waslalá. The two boys went together hunting chipmunks.

[411] 107, 14. sháwala to adjust stone-heads; shawalta, sa-ulía to adjust stone-heads for or in the interest of somebody. Flint-, obsidian- or iron heads are placed only on war-arrows or on arrows used in killing large game (ngé-ish, ngä'-ish); but the táldshi or lighter arrow, used in hunting birds, and the taldshiága, arrow used as boy's plaything, are usually provided with wooden points only.

107, 15. K'mukámts stûli sht pi·ts stands for K'mukámtchash stuli'sht pi'sh, the pronoun referring to the little son of K'múkamtch.

107, 15. shli'sht. In this sentence m'nálsh is the subject of shli'sht, and the direct object of shlín is not expressed.

107, 16. lä -udsha: they went out to play, from léwa, lä'wa to play.

*539 773 192 [482] ● [193] [222] 109, 1. shkä'shgatkaltk. A verbal adjective of shkátkăla, to carry on back; kä, ka is the radical syllable, found also in kä'mat, *back*. This distributive form is apparently due to vocalic dissimilation. Women carry conical baskets (yáki) on their backs when digging roots or bulbs, and throw them over their shoulders into these receptacles.

109, 2. 6. 8. Skélamtch. See Dave Hill's relation of the same myth; *Note* to 107, 3. In speaking of somebody who acts on the sly, and differently from what he professes and means to do, the Klamath Lake people will say: "He acts like Skélamtch." [193] This is one of the few proverbial locutions, or at least figurative modes of speech that can be traced in this tribe.

[291] 109, 3. kmä' is the rounded light cap usually worn by females, fitting tight to the skull. It is made of the stalks of aquatic plants, several species of them entering into the manufacture of each cap. The taking away of the skull-caps was intended as a signal for the women to go to their new homes.

109, 6. táta. The words of reprehension addressed by Old Marten to Weaslet are: "Did I ever order you to bring the caps of any other than of both the one-eyed women? I told you to get the caps of both one-eyed women only." Lápuk belongs to shtchûshχápkam, though separated from it by the inversion of the sentence; kmä' is left out.

[193] 109, 6. shtchûshχápkam. The distributive form of shtchû'χa is so difficult to articulate, that abbreviations of it like the above and others, have resulted. Shtchúχa is evidently the medial form of tchóχa, and its meaning is therefore "to suffer destruction on oneself." Cf. shtchúyampka.

109, 10. ni ä'pkatki. After ä'pkatki supply gi: "said, told."

109, 11. The text forgets to mention the calling in of the two one-eyed women.

109, 12. Shû'hank-shitk. In many mythic stories the newly-born children are made to grow miraculously fast, so that when a few days old they handle bow and arrows, and after a month or two they are adult people.

[194] 109, 13. ntéyăla, to make a bow or bows (nté-ish), nteyákăla, to make little bows (nteyága), nteyakalía or nteyakalíya, to make little bows *for somebody*.

109, 13. únak, *son*, is variously pronounced û'nak, vúnaka, wúnak; and so is its diminutive únakag, únakaga, vúnakak, *little son*, "*sonny*".

109, 15. hishla has two meanings, both *reciprocal:* to shoot at each other, and to shoot at the mark, *rivalling to outdo each other* in markmanship. Cf. 24, 17.

[193] 109, 15. Léwatkuk for léwatko hûk: they, after having played; participle of léwa to play.

110, 1. hûshûtánkapksh etc. "This was an approaching himself on the sly towards me" is the literal rendering of this sentence, in which the first term is a *nomen actionis*, a verbal indefinite. The two pronouns are governed by it.

110, 3. mish shli'shtka gi'uapk, if he should want to shoot you; if he should shoot at you purposely.

110, 4. Sháyuakta, "he knew." Omniscience and prescience are among the characteristic features of Old Marten, who is the personification of K'múkamtch. Cf. 107, 1. 3. 14. 108, 5. and *Note* to 107, 3.

110, 6. hútkalpĕli, to rise up suddenly, to jump up again (though killed beforehand). Cf. 108, 2.

110, 11. "shui'ulatchganka hû'n gi." Marten's son said, that his arrow, when

*539 dispatched after a chipmunk, struck a log or tree, glanced off from it and came very
773 near killing Weasel's little son.

192 110, 11. 21. guháshktcha instead of guhuáshktcha, cf. Dictionary.

110, 17. vû'sho, breast, chest, is also pronounced wû'shu, û'shu; û'shutala, in the chest. ḵ'leklχátko is the distributive plural of ḵ'lekátko; ḵ'léka, to die.

[193] 110, 18. mä'nshaktch, so long; stands for mä'ntchak tchí. The terminal -ak has to be taken here and in 110, 14. in the sense of the diminutive suffix: "a little long".

110, 19. kä'la to *do or act* in the sense of amusing oneself, playing, gesticulating, or acting in a loud, noisy, or grotesque manner.

111, 1. túnepanti. The partitive case in -ti, if it stands for túnepanta, is used here, because the bags of neckwear brought by Skélamtch were counted on the digits of one hand, while those of Weasel were counted on the fingers of the other.

111, 3. wewilína. Beads were left over to Old Marten, because he had brought more than five sacks full to the tchpínû or family burying ground, emptying only five sacks on the child's pyre. This was a fabulously extravagant expenditure, the beads standing high in price and the sacks or wíllishik being rated at more than one bushel each.

111, 4. Mû'sh and Yámsh, syncopated from Mû'ash and Yámash.

111, 9. elχishtok Mû'shash. The South Wind had put his head out; that is, a south wind had been blowing when Little Weasel died and hence was supposed to be the real cause of his death.

[821] 111, 12. Lĕmé-ishash. From the following it appears, that the five Thunders represent more the flash of the lightning (lúepalsh) than the roll of the thunder. There are many of them, because the thunder, when rolling over mountains and valleys, often increases again in loudness after having almost died out, and five is the often recurring "sacred" number of the Oregonian and other Northwestern Indians. The radix [193] of lĕmé-ish is *lam*, which indicates a circular, whirling motion. The five Thunders are [342] brothers, living in a winter-lodge or earth-house: Lĕmé-isham tchî'sh, thought to be a dark cave; their parents, the two Old Thunders, live in a káyata or low, small hut covered with bulrush mats. The short episode 111, 12–17 does not refer to all the five Thunders, but only to one of their number.

[321] 111, 13. tû'tash is the long white marine shell, known as dentalium; it is one of [301] the most common Indian body-ornaments. The white resin flowing out of pine-trees seems to be symbolized in this myth by the dentalium-shell.

111, 14. wák ish shû'tă, for wák shúta î nish: "somehow do (something) for me."

[193] 111, 20. In wä'shin are combined two locative particles: *i* and *n* (for na).

111, 22. mákiaks tû'm (for tû'ma). The Thunders brought home as food many human beings struck by lightning.

112, 1. wanúnga, the distributive plural of û'nak; explained in the Dictionary.

112, 1. wennívi a tuá gátpa etc. Here and throughout this paragraph tuá means "some kind of."

112, 2. 3. shkaíni combines the meaning of strong with that of bad or mischievous, and answers to our *demoniac;* shkaíniak or shkaínihak stands for our comparative: stronger. The -tch, -s, -sh appended is an abbreviation of tcha, *now*, and shkáyent stands for shkaíni at.

[342] 112, 3. Gékansha. Old Marten had entered the solid "earth-house" of the Thun-

*539 773 192 [342] [417] ders, while the Thunders stopped in the small kayáta which was the abode of their parents. To enter such an earth-lodge a high ladder called ga-ulúlkish must be climbed on the outside. and another ladder, as long or longer than the other (wakísh) leads into the interior Pätchö'le nä'shak, pépätchle (for pépätchöle) lápok wakísh: "he had stepped once", "twice" down on the inside ladder; that is, he had made one step, two steps on it commencing from the top. Each one of the Thunders, when trying to penetrate into their own lodge, gets a little further down than the previous one, but all are driven out by the *chilling*, powerful spell of Skélamtch's headdress.

112, 7. gúlipälánk. The second of the Thunders, frightened at the ill-success of his experiment, retired again to the low hut or kayáta, where the other Thunders were and where their parents dwelt. This word has two accents on account of shash being enclitic; cf. 111, 2. 112, 13. 113, 9.

112, 8. Tátχëlamni refers in this connection to the relative age of the brothers: "the third in age of the five Thunders."

112, 9. gekanshĕnû'nk: for gékanshna hû'nk. Cf. 113, 12. ktánshan nánui sχolχótak, for: ktánshna nánui shχolχóta ak.

112, 9. gû'tχitkt, a contraction of gû tkitko at.

[193] 112, 11. 12. "Ya! ati' a nä'lsh winni'χitk tuä'ki." This was said by all the five Thunders simultaneously and *unisono*. In tuá' ki, á is altered into ä', almost ó. The inserted particle hû, û "in the distance, out there, over there" seems to have produced this change.

112, 15. li'lhankshti l'tpa "he brought some venison," a phrase corresponding exactly to the French: "il apporta *du gibier*"; both nouns standing in the partitive case. These partitives are governed by another noun in 113, 6 (máklaksti) and 113, 7.

112, 21. pûelhi': they threw the dead Indians down into the lodge from its roof. The suffix -l- indicates a downward direction, like -ila, -kuéla etc., and occurs also in 112, 17, hä'mële, to speak in a downward direction, to shout to somebody standing below. The suffix -hi means down to the ground, or on the ground, earth, soil, and since the lodge-floor is the soil itself, it also means "into, or in the lodge or wigwam".

113, 2. íwa sha tchúl. They put into the bucket the bodies of the dead Indians to stew or boil them up.

113, 2. Nókshtak etc. The gray wolf, the marten and the weasel all being carnivores, there is nothing extraordinary in the fact that mythic fiction lets them participate in a meal consisting of human flesh.

113, 3. háshpa shash. Shash stands for máklaksash, the dead Indians.

113, 8. nánuk wû'ta. Marten ate up all the human flesh which he had taken out of the kála.

113, 8. shéwanank. The verb shéwana refers to a plurality of objects, the objects being sometimes expressed by a collective noun, as here (tchulë'ksh).

113, 9. Ké-udshiámtchkash stands for Ké-udshiamtch tchkash; nû'kla is to roast on coals; tchulë'ks is here venison meat.

113, 13. ka-uloktantktám'na. The verbal suffix -tám'na, which marks an action often repeated, or continued for a long time, is not here, as usually, appended to the simple form of the verb, but to its derivative in -tka.

113, 14. Tchékag. The blackbird has yellow eyes shining bright in the darkness,

192

The myth of the Bear and the Antelope is one of the most attractive and best stylicized of this collection. It forms a whole mythic story by itself, and not a series of myths like the preceding article. The Grizzly Bear's figure is drawn in very natural and characteristic outlines, and the same may be said of the other animals of the story. Some archaic words seem to prove that the myth has been handed down for many centuries to the present generation, which repeats it to the offspring with the *same* expressions as used by the parents. The archaic terms alluded to are Sháshapamtch, paépsha, pshe-utíwash, kúkui, tchitchû; probably also lepleputéa.

118, 1. 7. Sháshapamtch alternates in this tale with Lû'k̲amtch, the "Grizzly Bear of the Ancients," and so does lû'k̲aga with shasliápka. -ámtch, -ámtchiksh is the usual attribute "old" appended to mythologic characters. In the mythologic stories of the Indians bear-cubs always appear *two* in number, the older and the younger one. The same may be said of the majority of the other quadrupeds; cf. the two young of Old Antelope, in this story, and tχéwag, 105, 9, as well as of many of the personified powers of nature. Cf. the term lepleputéa.

● [193]

118, 7. 119, 2. gi'nk or kínka: a little, not much; mé-ishl contains the particle l or hi: "on the ground".

119, 9. pû'kpuka: she cracked hard ipo-roots, feigning to crack lice which she pretended to have found on the antelope's body. Picking lice from each others' heads (gútash kshíkla) and eating them is a disgusting practice which travellers have observed among all Indians of North and South America.

119, 10. nánuk: the whole of her body.

119, 11. ipĕnĕ'χi: to place something into a basket or receptacle which is already filled to the brim.

119, 20. 21. hû t málam etc. The construction is as follows: "málam p'gi'shap hû't mák̲lĕχuk shû'dsha, p'gi'sha laggayápkash hû'nk killi't, hûnkiámsham shû'dshash": your mother made a fire out there because she must have passed the night there, and because she hung up this anus on a stick, while the Indians (who gave meat to both of us) had a camp-fire.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 773 192 120, 2. tchishknapsht instead of tchishkuápkasht.

120, 10. vutátchkia is also pronounced utátchkia, hutátchkia. Earth-lodges which open on the top can be closed by means of a large cover placed over the smoke-hole.

[194] [193] 120, 11. lepleputéa or properly: leplep-putéa, "to play the smoke out game with two on each side," is a compound of lápĕni *two* in the shorter form láp, and púta to be smothering. Láp has changed its vowel into a shorter vowel, *e*, on account of removal of accent, and is here redoubled by iterative, not by distributive reduplication. Cf. lepχléks from láp and k̲'léka. A series of points after lepleputéa indicates that the animals repeated this word an indefinite number of times, while the others were inside the lodge, and while pronouncing putā', they opened again to let them out.

120, 17. tchúχasht tchĕ'k kaishnû'la. Literally rendered, this means: having perished finally, they uncovered. The subject of tchúχasht, lû'lχagsh, has to be supplied from what precedes. The smoke of the burning rotten wood killed the cubs.

[342] [417] 120, 19. ga-ulû'lkish, from ga-ulóla to go out, is the outside ladder of the Indian "mud-house" or winter-lodge, averaging in length from 10 to 15 feet; the inside ladder, wákish, is somewhat longer to reach the excavated floor.

120, 21. The complete wording of this sentence, in which sháptki stands for shápatki, would be: k̲á-i sháptki giug Lúk̲ash, gátpampĕlisht hû'nksh (hû'nkiash).

[193] 120, 22. ágguipksh, contraction of aggayápkash: aggáya to be hung up, or to be stuck into; said of long-shaped articles only.

121, 3. anulípka to take away something from another's lodge or house without asking for it; the suffix -ipka expressing the idea of "towards oneself." Anulípkuish, "what was once abstracted from others" appears here in the contracted form anuli'pkūtch; gé-u "by me, through me."

121, 9. tútatataksni shows repetition of the two first syllables of tatáksni children, but at the same time means "where are the children?"

121, 15. shálgidsha; the antelopes placed the coals there to secure their flight from the Bear; had the coals been put there by somebody else, lákidsha would be used.

121, 22. 122, 7. hû'ktakag: familiar diminutive name given to the Grizzly Bear; hû'ktag, 121, 23., stands for one of the young antelopes.

122, 1. 2. Mbúshant tchĕ'k etc: The sense of this exclamatory sentence is as follows: "To-morrow at last I will play a sharp game with ye children, when in the day-time I can use my eyes to advantage." Lúlpatka is: lúlpatko a; "possessing eyes" is the primary signification of lúlpatko, but here it means "enabled to make use of the eyes". Cf. múkasham nû lúlpatko: I see as sharp as a horned owl. The distributive form pshépsha, of pshé, "during day-time" means "any time when the sun shines bright." Cf. pshéksh, noon-time.

122, 9. This blowing of personified objects of nature into sticks etc., is a fiction of which we have another instance in 111, 16.

122, 11. ndshenshkáni. See *Note* to 71, 6. 7.

122, 12. 13. tchiwá, tchi'tchu: tchi is a syllable found in many words referring to water and liquids, as tchíya to give water; tchiéga to overflow. This radical is no doubt an obsolete Klamath word for water and recalls the term tchû'k "water" in Chinook jargon: tltsuk in Lower Chinook, tl'tchuku in Clatsop; tchaúk in Nútka. It also occurs under various forms in the Sahaptin dialects. By this lake undoubtedly Upper Klamath Lake is meant. Cf. tchíwa in Dictionary.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 773 122, 13. ga tuá nink for ká-a tuá ni gíank; ká-a means here "vehemently, cruelly, sharply", tuá: "in some way or other".

192 122, 16. shash géuuish: after they had left the cave.

[193] 122, 20. "aishing tū'dsh i shásh nen". Here nen stands for some finite verb; either shaná-uli i: you want to conceal them; or for ná-asht i shapíya: "you speak so, in order to conceal them".

122, 23. spû'kua. The spread-out legs of the Crane had to serve as a bridge to the Grizzly Bear, for there was no dug-out canoe at their disposal to cross the river.

122, 23. máksha néklank. Old Crane carried on his leg a vase or skull-cap that belonged to a dug-out canoe, but did not possess a canoe himself.

123, 3. u'hlítcha. Grizzly shook out the remainder of the water to let the skull-cap become dry. Skull-caps are used throughout as drinking vases.

123, 6. táldshitko. This sentence has to be construed: wíwalag, shō'kshám wewákalam táldshitko, ngé-ishan, and táldshitko stands for táldshi gítko: "the young antelopes, armed with the arrows of the Crane's children, shot" etc.

K'MUKÁMTCHIKSHÅM SHASHAPKĔLÉASH.

spirit, would die I it through seeing; but if I recur to magic songs, then not

siúgat nía.
he may kill me.

NOTES.

[128] My efforts towards obtaining exhaustive texts from the natives concerning their belief in the transmigration of human souls were not crowned with entire success. Of the two items obtained, No. II is intended as a commentary of No. I, both treating [262] of the presence of human souls in fish. The cause why so many Indian tribes shun the flesh of certain fish lies in the fact that these species were seen feeding upon the bodies of drowned men and swimming around them. This induced the belief that man's soul will pass into the organisms of these finny inhabitants of the wave, even ×539 775 787 192 when death has resulted from other causes than from drowning. According to Hill, the Mák̲laks believe that the souls or spirits of the deceased pass into the bodies of living fish; they become inseparably connected with the fish's body and therefore cannot be perceived by Indians under usual circumstances. But in *one* status only they become visible to them; when Indians are bewitched by the irresistible, magic spell of a conjurer or of a wicked genius. Then they enter into a tamánuash-dream, and when they see a dead person's spirit in such a dream, they are almost certain to [755] die from it. Only the intervention of the conjurer and of his song-medicine can save them from perishing; rigorous fasting and ascetic performances cannot be then dispensed with, and with all that no certitude of his final rescue is to be had.

[769] Here as elsewhere the pronouns hûk, húnkiash etc., are inserted instead of the unpronounceable name of the deceased, and mean: *dead person, spirit.*

129, 2. pll mák̲laks; only dead Indians, not dead white men, because during their life-time these did not believe in the skû'ks; this belief is a privilege of the Indians.

129, 2. Hushti'χak etc. This sentence runs as follows: Tchē'ktoks hushti'χa ak nish, hûk tchē'k nish síuksh shanahō'li, wakiánhua tchēk p'násh (or pû'sh) nû'sh shuíshaltki gíug shanahō'li: "if he (the bad genius) makes me only dream in that manner, then he intends either to kill me, or perhaps he wants me to keep the song-medicine [756] for myself." To keep the song-medicine, shuíshla, is to undergo fasts and ascetic performances under the supervision of some conjurer for an almost unlimited time, five years at least.

129, 3. 4. Hä'toks ni' shläát etc.: if I should see (the dead) while I am *awake.*

[193] 129, 4. Skû'ks-kiäm, a compound word, may be rendered by spirit-fish, letiferous fish.

130, 1. Kiä'm k̲'leká etc. The rather obscure sense of this statement may be made comprehensible by the following: "When fish are dead, they are dead forever; hence

NOTES.

823 I. This myth intends to explain the existence of the large number of rocks found at the locality called Shúyuχalkshi.

196
193
131, 2. K̲á-ak̲amtch. The adjectives -amtch, -ámtchiksh appended to animal names designate mythologic characters. Adjectives of an equal meaning occur in all the western languages, as far as these have been studied. Cf. *Note* to 126, ll. 12.

825 II. In this myth, as well as in other grizzly bear stories recorded in this volume, this bear is always killed, conquered or cheated by his quicker and more cunning adversaries. Nevertheless his clumsy form and narrow, ferocious intellect are very popular among the tribes, who have invented and still invent numerous stories to illustrate his habits and disposition.

103 131, 5. K̲iuti is the name of an Indian camping-place situated a short distance north of Modoc Point, on eastern shore of Upper Klamath Lake.

193 131, 6. hátkok qualifies shkû'lχa and yámnash is the indirect object of shûlû'tamantk. Shkû'lχa, nánuk yámnash shûlû'tamantko, wawakshnátko tchish: "he lay down to sleep, keeping all his neckwear on himself, and not taking off his moccasins." Shûlû'tamna can in other connections refer to the clothing, but here it has special reference to the beads.

131, 11. kti'ukuela. Tradition reports, that Old Grizzly was pushed over some of the high rocks at Modoc Point.

173 131, 13. Yámakishash etc. In these words may be recorded the reminiscence of an ancient fight between the Klamath people and some Northern tribe which had come South on a hunting expedition. A Klamath song-line given in this volume also recalls
*539
773
825
an ancient inroad made by the "Northerners". The grizzly bear represented the Klamath tribe, the wolf the Northern Oregonians, perhaps as ancient totem signs; the bear having been killed by an intruder, the Klamaths had to take revenge for the insult.

823 III. The object of this myth is to explain, among other things, the origin of the white spots on the head and back of the loon (táplal). But the myth as given in the

*539 171 is the elder sister, called so by or with reference to a younger brother. Two other terms exist for the relative age of sisters among themselves.

[601] 134, 11. pátkalp'le. The myth adds, that the eagle got up again at dinner-time and that after washing the face he took a nap before taking his sister home.

[525] [777] II. These items were all obtained in the Modoc dialect from J. C. D. Riddle. Many of the articles mentioned as gamblers' amulets are supposed to bring good luck to the gambler on account of their *scarcity*, which must have made them more interesting to the aboriginal mind than other objects of a brighter exterior.

[192] 134, 13. ntäggal, ndákal: to find accidentally; shléa: to find, generally, after a search. vumí' is to hide away either on one's own person or in the ground.

134, 16. 18. tídsh tínχa is to succeed, to be lucky; without tídsh in: hútoks tínχantko gi, that man is lucky.

[411] 134, 17. shtáp is a black arrow-head made of obsidian, a volcanic rock found in several places in these highlands.

135, 1. hä'-atoks is formed from hä toks with intercalation of the declarative particle a.

[192] [193] [825] 135, 3. k̲'le-ugtki-uápkasht is a periphrastic conjugational form composed of giuápkasht, of the verb gi, and of k̲'lé-utka, the usitative of k̲'léwi, to cease, stop, terminate; -utka has turned into -ugt- by metathesis. Literally: "would habitually cease to be in the Pit River." mhû', the grouse, is called by the Klamath Lakes tmû'.

wutuápka	kinkáni	kátchgal;	kinkáni,	k̲á-i	túmi,	tchē'k	pēn	túmi	pákuapka,
I shall spend	a little	tobacco;	(but) little,	not	much,	afterwards	again	much	I will smoke,

pakólank	sχólakuapka.
(and) after smoking	go to bed.

NOTES.

Of the two paragraphs of "Reflections" submitted, the first refers to the loss of some hunter's arrows, which had been loaned to somebody together with the bow. The second speaks in a rather egotistical sense of the pleasure which is afforded by succoring helpless and indigent people.

*539
171
192
[193]

136, 3. k̲ä'gi. This refers to some arrows, which cannot be found at the spot, to which they seemed to fly.

136, 4. 5. Untchĕk, abbreviated undsĕ, ū'ntch, únda, ûna, points to some undetermined epoch in the *future:* by and by, after a lapse of time, some time from now; undsĕ't, 136, 8., through apocope and synizesis, stands for untsĕ'k at; undsĕ'ks for untchĕk tchish.

136, 5. Shikútchipk tchiká kĕmutsátk, grammatically incomplete forms standing for shikutchípka t'shíka kĕmutsátko. The word *stick* is not expressed in the text, but the suffix -ipka, united to shikútcha, expresses the idea of "walking while leaning oneself upon something or somebody". Cf. láyipka, to point the gun at the one speaking; tilö'dshipka, to see somebody coming towards oneself.

136, 6. kí'shtchipka, to step towards the one speaking; cf. *Note* to 136, 5.

136, 7. oni'sh for húnish, cf. ó'skank for hû'shkanka, 65, 1. Húnish is the objective case of hû'n; but this pronoun is not regularly used when speaking of animate beings; hû'nkiash would be grammatically correct.

136, 7. shéwant i. The words oni'sh kiäm shéwant i are supposed to be directed to one belonging to the speaker's household.

136, 8. The term kátchkal, tobacco, expresses the idea of an *intermixture* of several kinds of weeds or leaves for the purpose of smoking them.

136, 8. pa-uápk. A more appropriate term than this for masticating tobacco is: kátchkal kpû'yumna.

137, 1. titchéwank. This is in fact the participle of a verb: "I like tobacco, being fond of it."

137, 2. stoyuápka: I shall cut off a piece from a stick of pressed tobacco and give it to him. Cf. stuyákishka, to clip the hair.

137, 3. kinkáni kátchgal. If this and the following were not worded in the conversational slang, it would read: kinkánish kátchgal; kinkánish, k̲á-i túma, tchē'k pēn túma (or tû'm) etc.

[274]

137, 3. k̲á-i túmi. Indians are not often seen to smoke continuously as we do; those inhabiting the Klamath Reserve take a few whiffs from their small, often home-made pipe, then pass it to the neighbor and emit the smoke through the nose. Sometimes they swallow the smoke for the purpose of intoxication, and the elder women smoke just like the men. Cigars offered to them are cut small and serve to fill up their tobacco-pipe.

763

WAILINGS AT THE APPROACH OF THE FATAL HOUR.

115

GIVEN BY DOCTOR JOHN, OR K̲ÁK̲ASH, IN THE KLAMATH LAKE DIALECT.

"Ngä'-ish a ni tä'lχapksh, gé-u tä'lak, shlín antsa; shkék antsa nû'sh,
"An arrow me striking, my arrow, shot they; they broke (my) head,

shlín nish. Kán ish shlín? Tsuyä'sh ní shlín, gén ish tsuyä'sh mpáta,
they shot me. Who me shot? Through the cap I was struck, this me cap kills,

másha n'sh, shlín ish nü'sh, k̲á-a n's mā'sh', guhuá nish, a nish k̲á-a mā'sha!
it pains me, they shot me in the head, intensely me it pains, am swollen I, now me hard it pains!

Púsh ish shéwan i; k̲'lékuapkan pánuk; pálak shéwan i, a nish k̲á-a mā'sha,
Food me give you; I will die after eating; quickly give you, me very hard it pains,

tiä'matk k̲á-a, pálak shä'wan i." At shéwana nû, at pán; shnuk' át mí'dsû.
(I am) hungry very, quickly give you." And give (him) I, and he eats; he takes now the spoon.

"At k̲'léka, átĕni k̲'léka; tsía at, k̲'leká taks nû; shlín nish nû'shtat.
"Now I expire, now I die; I live yet, dying but (am) I; they shot me in the head.

764 **A ni k̲'léka, ā'tĕni k̲'lekála." At k̲'leká. Shû'dsha lúluksla sa lû'lokshtat**
Now I die, now I am sinking fast." Then he dies. Kindle a fire (and) cremate they in the fire

hû'nk k̲'lékapksh.
the deceased man.

NOTES.

*539
763
192

This short incident of war is full of the most dramatic interest, and gives some idea of the oratorial powers of the average Indian. It was obtained from a man who undoubtedly had witnessed more than one similar scene during the numerous raiding expeditions made by his tribe before the conclusion of the treaty in 1864.

138, 1. ngä'-ish a ni tä'lχapksh shlín antsa, forms of the conversational language standing for ngä'-ish a nish tälχápkash shlín a sha. gé-u tä'lak "my arrow," a poetic symbolism for the arrow that causes my death.

138, 1. shkék antsa for shkéka a sha, but nasalized like shlín antsa. Shkéka properly means to pierce, but is used in a medial sense.

138, 2. mpáta properly means to dry up by heat. The cap or hat is said here to kill the man by exciting an intolerable fever heat within him.

193 138, 3. mā'sha n'sh. Some impersonal verbs can also assume the personal form of intransitive verbs: mā'sha nû and mā'sha nish: "it pains me"; kédshika nû and nish: "I feel tired". The Modoc dialect prefers the personal form.

138, 6. 7. atĕni for at a ni. Cf. sĕ, 82, 4. tchä'lχet 90, 11. átĕnish, atĕni 90, 12. 13. gĕ'ntĕni, *Note* to 93, 7. 9.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 782 177 192 [193]

rendered by "something wicked" and "not to mind"; for "thy will be done" stands "achieve thou". Power and glory become "force, impetuosity" and "radiance", and daily bread: "flour on every day". In the Modoc version, the wording of which is inferior to that of version I, the use of similar expedients will be observed.

I. In the Klamath Lake dialect; by Minnie Froben.

139, 6. inúhuashkpak, phonetic inversion for inuhuashkápk' i; see Dictionary.

139, 7. ktchálshkash, from the word ktchálχa, to shine, to be radiant, resplendent.

139, 8. gitk, in an hûn gitk gi, is the verbal intentional gitki.

II. In the Modoc dialect; by the Riddle family.

139, 10. Gitá käfla is equivalent to gĕ'nta käflatat; in humashták gi the verb gi has to be taken in the *passive* sense.

139, 11. kó-i shû'tä: "do not render us wicked." For shútä compare 111, 15. and *Note*.

139, 12. húmasht nálam. Between these words and the preceding ones there is a lacune in the text. máklaks-shitko, "our kindred": those who look like ourselves.

139, 13. 14. In mi tála litchlítchli the adjective strong stands for "strength, power", while in mi steínash litchlítchli it is used in its adjective signification. In this language abstract ideas are sometimes rendered by adjectives and by verbal adjectives in -tko.

DIALOGUES.

I.

*539

TSÉMATK. Tatá lish sha ksíulakuapk?
When they will dance?

SKĂ'LAG. Pá-ak ká-i an sháyuakta! uná a sha ná-asht she-édshtat mat sha nánuk shûkû'lki-uapk kshí'ulχish.
Not I know! once they so (said), on Saturday they all will assemble for the dance.

KÁPUAK. Tátai tchí'k sha kshíulakuapk? Plē'nkamkshi á? tám hak haítch i hû'nk shläátk? kúi a sha nen hûnk máshish gish shápa.
Where after all they are going to dance? At Frank's house? perhaps (did) you him see? seriously they him diseased to be say.

SKĂ'LAG. Káyak an hátokt gátpantk, ná-asht tā'dsh toks nû tû'mēna gén mbû'shant pil, mat pá-ula: gät tóks nû wátch káyaktgûk, kúinag gépgapēle.
Not I there was going, thus however I heard this morning only, (that) he was eating: out there I of my horses while returning from the search, away from any house I returned.

KÁPUAK. Tám haítch i nä'gsh shíwaksh shläá gúni, gémpktch Kúyamtsχēksh, Ellen Débidam mû'kag shétaltchapksh mā'shisht?
(Did) you absent from home the girl see over there, who went to Kä am [illegible], of Allen David a baby to visit having fallen sick?

SKĂ'LAG. Ká-i an tû'sh shleá pûsh.
Not I anywhere saw her.

KÁPUAK. Ï.
Is that so?

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539

Skä'lag guhuáshktcha; Käptinámkshi tchkash sha vûlánkia: "Tát tamnû'tka?"
Skälak left; at the Captain's lodge also they inquired (of him): "where you come from?"

Skä'lag. Gē't an wátch káyaktka, ksíulakshχēn genû'tuapkuk.
Through there I of (my) horse returned from the search, towards the dance-house while intending to go.

Captain. Táta haí tchí'k sha kshí'ulaktchuapk?
Where finally they are going to dance?

Skä'lag. Mbû'shant a sha she-édshtat kshíulaktchuapk Mbû'shak-Shiwáshkni, ák tchish nánuk gépkuapk.
To-morrow they on Saturday will dance the dwellers at Mbû-shak-Shiwash, probably too all will come.

Tchúi guhuáshktcha gémbaluk.
Then he started off to go home.

II.

Hlékosh. Tát lish mí û'nak?
Where (is) your son?

Pépakli. Le-utchólan kaní úna geknō'la; le-utchólan tunepä'nish tatákiash túla.
For playing outdoors a while ago he went out; for playing five children with.

Hlékosh. Wakaítch gé-uga k̲aí gépgaple?
Why not returns he?

Pépakli. Tútaks atí léwa; hótaks tatáksni waíta léwapka; lítki gatpampēli-uápka.
Away far they play; those children the whole day will play; in the evening they will return home.

NOTES.

*539
192
[193]

I. Dialogue about a dance to be held on the Williamson River; in the Klamath Lake dialect, by Minnie Froben.

140, 2. Pá-ak k̲á-i an sháyuakta! is interpreted by "what do I know!"

140, 9. nä'gsh shíwaksh gémpktch stands for négsh shiwákash genápkash. It is very rare that diminutive nouns, like shíwak, shíwaga, assume the ending -ash in the objective case; cf. 23, 10. But shíwak means not only a little girl; it means an adult girl also, and is therefore inflected like snáwedsh.

140, 9. Kúyamtsχēksh. For this local name cf. Page 91, first *Note*. Frank and Allen David live both at that place, close to the steep western bank of the Williamson River, while the communal dance-house, a spacious, solid earth-lodge, lies further to the northeast.

141, 5. Mbû'shak-Shiwáshkni, term corrupted from Mbû'shaks-Shawálshkni: "the one who lives, or those who live at the locality of the obsidian arrowheads." Mbû'shaks-Shávalsh lies on the eastern shore of the Williamson River. Cf. *Note* to 134, 17.

II. Dialogue in the Modoc dialect; by Toby Riddle.

141, 9. Léwa, to play, forms the derivates lé-utcha to go to play; lé-utchna to play while going, to play on the way, cf. shuédshna 99, 2.; le-utchóla to go to play in the distance.

*539
192
193

141, 11. gi-nga for the more common giuga, giug.

141, 12. léwapka to play in the distance, out of sight, or unseen by us; but here this term is more probably a synizesis of léwnapka, the future tense of lówa.

NAMES BESTOWED ON UPPER KLAMATH LAKE LOCALITIES.

GIVEN BY DAVE HILL IN THE KLAMATH LAKE DIALECT.

K'mukámtch mat käfla shû'ta. Tsúyunks ä'-alk käfla shutólan:

K'múkamtch, as they say, the country made. The following names gave he, the country after creating:

Tuli'sh käfla E-ukski'shash shúta K'mukámts kiäm-luelksli'a; Tuli'sh tsí-

"Tulish" place for the Lake people made K'múkamtch to be their fish-killing place; Tulish,

hunk ä'lχa. "At hû'nk käfla gít ktaíksi Shúyakēksh tchín ä'lχa; gitt

thus he named it. "And that spot there where the rocks are, "Jumping-Rocks" so I name; here

shuyéakēks gi-uápka". E-ukskísas K'mukámts né-ulχank hemé χe:

a leaping place shall be". To the Lake people K'múkamtch ordering said:

"Tû'kua ná-asni kä'la nä'sni élχa gí'ta Tû'kua; Gû'mbat nä'sni gít élχa;

"Túkua so I a spot, so I name here Túkua; Kúmbat so I there give name;

gíta Kä'lalksi nä'sni élχa gí'ta. Wakáksi spû'klishtat gí't i spû'kle-uapk;

there Dirt-healing place, so I give name there. At Wáka in the sweat-house there you shall sweat;

hä' me wéash k̲'lä'kuapk gí't i spû'kle-uapk, hä' mi snáwedsh k̲ēlákuapk

if your child should die, there you shall sweat, if your wife should die,

gít i spû'kle-uapk túnepni gitá; túnepni spû'kle-uapk snawédsh, hä' mi

there you shall sweat five (days) there; five (days) shall sweat (you) wife, if your

hishuáktch k̲ēlä'kuapk. Túnepni spû'kle-uapk, tsúi k̲íllitk tsulä'ks gí'-

husband should die. Five (days) you shall sweat, then strong (your) body will

uapk, k̲á-i pálak i kĕmútchuapk."

become, not fast you will become old."

"Näsht ni ne-û'lχa Á-usmi shéshuapk; nä'sni élχa gēn käíla.

"Thus I ordain Á-ushmi to be called; thus I give name to this spot.

Koháshti ná-ast ni élk̲a gí'ta. É-uk̲alkshi nä'sni élχa gí'ta; gí'tats spû'kle-

"Set out" thus I call that place. E-ukalkshi so I name this place; here also you shall

uapk, tuni'pni i spukle-uápka wéas k̲'lekáluk, tû'nipni snawédshĕsh k̲ēle-

sweat, five (days) you shall sweat a child after losing, five (days) a wife after

káluk hishuáksh tchish; k̲á-itoks mi sa-ámoks k̲ēlékst k̲á-i i spû'kle-uapk,

losing, a husband also; but not, your relatives having died not (then) you shall sweat,

hä' mi sa-ámoks nánuktua tsók̲uapk. Ká-i i gitá spû'kle-uapk ndännántak:

if your kinsmen of all degrees shall have died. Not you there will sweat but for three:

snawédshtat, hishuákshtat, wéashtat."

for wife, for husband, for child."

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 773 103 "Nakótk Wi'tlas k̲ok̲état hi tchi'sh luélks-kiäm gi'-uapk; na-ást shé-
"By (its) dam Witlash in Williamson River there also a fish-killing place shall be; thus

shash élχa ni: Ktá-i-Tupáksi. Mbû'saks nä'st shéshatk mák̲laks gi'-uapk;
name give I: Rocks-where-stand. "Obsidian" so called a people shall exist;

Smä'k nä'st sésatk gi'-uapk mák̲laks gi'ta. Kä'katils nä'st sésatk gí-uapk 3
"Hairy" so named shall exist a people there. "Armpit-hairy" so called shall exist

gi'ta mák̲laks."
there a people."

NOTES.

All Mák̲laks admit that K'múkamtch created their country, the earth and the universe, but as to the special process by which he created them they seem to have no definite idea, though they possess a multitude of myths for special creations.

Most of the places mentioned in this item are situated around Upper Klamath Lake. That they are localities inhabited for centuries past, and identified with the history of the tribe is proved by the fact that their naming is ascribed to K'múkamtch. The most noticeable of them are no doubt the three sweat-houses, all of which are of remote antiquity, and were put to use only when families were mourning the loss of one of their members. Two of them are quoted here: Wakáksi or Käilalkshini spúklish on west side of Lake and É-ukalksi, a short distance south of Fort Klamath. The third lies about three miles south of Modoc Point; it is called Ká-ashkshi spúklish.

*539 773 103 192 142, 1. käíla. About the meaning of this term in creation myths, cf. *Note* 96, 23. In other connections, in the present text, käíla or kä'la means spot, locality.

142, 2. 3. Tulish. To enable the Indians to catch fish at that place, K'múkamtch built for them, as tradition has it, an obstruction resembling a beaver-dam. Cf. nakótk, 143, 1.; giti for gíta hi.

142, 3. 5. Túkua and Kohásbti are camping- and fishing-places on the eastern shore of the Lake. At Shuyakë'kish the Indians leap over rocks for amusement.

142, 5. ná-asni, ná'sni stands for ná-asht ni: "thus I".

142, 5. 11. Gúmbat is called Rocky Point by the white population, and lies on the western shore of Upper Klamath Lake. A-usmi is an island of the Lake.

142, 6. Wakáksi or Wáka is named after the tuákish-fowl whose cry is wáka wáka.

765 177 142, 6–10. 12–16. These mourning customs are gradually disappearing at the present time. One reason for this is the progressive assimilation of the tribes to American customs, another is the circumstance, that all of the three ancient sweat-houses are situated outside of the reservation limits.

142, 15. ndünnántak is composed of ndánnanti or ndánnantat ak: "only for three (kinds of relatives)".

193 143, 1. Nákotk is the instrumental case of nákosh, lumber-dam: "on account of its dam Witlas will be a fish-killing locality." A loon destroyed that dam by forcing its way under it; one of our texts gives this myth. Cf. 132, 1–8 and *Note* to 74, 2.

829 143, 2. 3. Mbû'saks, Smä'k and Kä'katils are names given in contempt or derision of the respective tribes; the latter to Indians living at the Dalles of Columbia River, Smä'k to a tribe living south of that locality. Cf. 103, 2. 3. Mbû'saks is a name for the Snake Indians.

[222] [302]

Wákinsh a k̲édsha pánût. Mák̲laks íshka pánût lultámpkash shutelomá-shluk, lúshnank sha shnē'lakshtat. Tchúi tchík sha núksht wátitka vukútank shushatelóma télish, p'nä'sh ktchálχishtka shkukluápkasht; p'lû' tak sha íwínank shtéwa.
grows on the pan-tree. The Indians pick it on pan-tree sticking to smear themselves with. roast (it) they on fire-place. Then they after baking (it), with knives scraping (it), smear it on faces, themselves from sun-burns to preserve; grease they putting into mix up.

NOTES.

[193] [196]

Several plants in this list appear, according to grammatic rule, in the possessive case -am, while their fruits or edible portion are introduced in the subjective case. To the former the substantive ánku or tsélash has to be supplied. Small grasses are alimentary plants on account of their seeds only, while the larger aquatic grasses contain nutritive matter in their stalks. Of these notices the shortest and most laconic were obtained from Morgan, who did not enter into particulars concerning the preparation of aliments. By this list the articles on which these Indians feed are by no means exhausted; they eat almost everything found in nature which is not positively obnoxious to health and which contains a particle of nutritive matter, and hence a full list of their kitchen *répertoire* would be at least three times as long as the one obtained.

*539 262 824 192

146, 1. kak tán for ká ak tánni "so long only"; the length being shown by gesture of hand. Also expressed by ka taniáni, 149, 1. and *Note*. The yántch-plant grows to a length of 18 to 20 inches, the height of the camass- or pû'ks-plant.

146, 3. Kápiunksäm. The kápiunks-seed grows on a prairie-*grass*, like the tchípash- and nû'tak-seed.

[193]

146, 7. 14. pálpal stands for pálpali (originally pálpal-li), having lost its terminal -i by apocope; pálpalish shlapshháltko incorporates the adjective *white* into the verbal adjective "having flowers". This phrase may be circumscribed by pálpalish shlápsh gitko. Cf. 123, 6. and *Note*, and 150, 1.

146, 8. wi-ukayant kĕládshamat. Here the adjective in its locative case, used attributively, is united with the partitive case of the substantive, the original form of both being wi-ukáyantat kĕládshamti; the subjective case: wi-ukáni kĕládsham.

146, 12. Kĕnáwat or horse sorrel is mentioned in an Aishish-myth and does not

*539 grow so tall in the cold Klamath highlands as in the Californian and Oregonian valleys
262 adjoining them to the southwest and west, where its height attains sometimes three
824 feet. Cf. *Note* to 94, 9.

172 **146, 14. Klána**, an aquatic or tule-grass, of which they eat a portion of the young
[193] stalk. The term "tule," from Aztec *tolin*, serves in the West to designate all kinds of
rushes, stalks, and grass-like plants growing in the water and wet grounds. By
k̲ók̲ĕtat are meant the Williamson and the Sprague Rivers.

• / **147, 1. Klápa** is the name of the eatable bulb or root growing on the púdshak-plant. The púdshak-grass becomes red in the autumn, when dry.

147, 3. Ktû'ks is the eatable root of a species of the cat-tail plant; táletat, locative case of tálish (or tálesh?), straight stem, from táltali "forming a straight, unbroken line." The ktû'ks grows in the water, like the wild parsnip (skáwanks); the natives dry the tender roots of the ktû'ks and bake them into a sort of bread. The epithet: "like wókash" probably refers to the *taste* of this kind of food.

147, 5. Kû'ktu. This plant attains a length of about 6 inches.

147, 6. 7. K̲áls is the globular bulb of the witchpai water-plant.

147, 8. K̲ä's, k̲ä'sh. This plant produces a hard, whitish, farinaceous bulb, which is commonly spoken of as ípo, a Shasti term, and is one of the most important food-articles of the Oregonian Indians. To dig or collect k̲ä'sh: k̲ä'shala, k̲ä'shla.

[252]
[825] **147, 9–13. K̲ō'l**, also pronounced k̲û'l, gû'l, gúl, is a kind of Aralia. The root is eaten only when roasted, and is then very nutritious, though spreading an abominable smell. This odor is so penetrating that, as alleged, the grizzly bear will attack nobody who smells after roasted k̲ōl; to this we may add the restriction: "if he is not very hungry." John D. Hunter mentions in his "Manners and Customs of Indians," etc. (Phila. 1823, page 370) that the Osages ascribe to the plant washoba-pesha the power of scaring away the black bear. This plant is an annual growth possessing sudorific and cathartic properties. Washobe is the black bear, mitchú the grizzly bear in that Southern Dakota dialect.

147, 9. hû'mtcha gû'l: "the k̲ōl in this condition," viz: in the ripe state. The k̲ōl-plant is ripe when the stalk becomes red or reddish.

[193] **147, 10. méya.** Speaking of *many* women digging bulbs or roots, stá-ila, stä'-ila is the regular form; its proper signification is: "to fill up" "to fill" (the conical root-basket worn on back, yáki).

147, 10. 11. pû'kguishamtat: "to their old roasting place"; púkuishamat might stand instead. The locative suffix -tat, -at is here appended to a verbal substantive of púka, to roast, standing in the possessive case -am, and -u- is the infix marking past tense. The guttural k has become distended into kg.

147, 12. ĕ'nt or **ĕ'nd** for énat, conditional of éna. Instead of ĕ'nt, ídshant (for ídshnat) may stand in the Klamath Lake dialect.

147, 14. Lupí' etc. The import of this sentence is: "L'bá ripens in the month when autumn begins."

148, 1. Má-i is the common reed or tule-grass growing sometimes to the height of 8 to 10 feet. The shallow borders of the lakes in the headlands of Klamath River are full of this growth, which is one of the most important economical plants for the
[285] Indian. Women manufacture from it mats, dishes, baskets, lodge covers, nets, sacks, bags, and the young stalk yields in its lower part a palatable marrow.

*539 148, 2-4. Yánakänin for yanakänini; cf. suffix -ni, -nini in Dictionary. mä'nsh for
mä'ntch. pä'shtak for páhasht ak, cf. pä'sht, 147, 17. for páhasht.

262 148, 5. Nú'tak. This grass belongs to the genus Glycerium, as identified by Dr.
824 E. Foreman, and produces a tiny, grayish bright seed of tchípash size. The flowers
192 are of a light red color. The grass is found around the agency buildings and grows
about one foot high.

148, 7. Páwash properly means *tongue.*

148, 11. Pû'ks or *camass.* Its bulb is one of the principal food-articles of all the northwestern Indians, but does not grow in profusion in the warmer portions of California. It is of the magnitude of the walnut, very saccharine and nutritious, ripens in May and June, and by the roasting or baking process described in the text becomes as hard as stone. The Máklaks call it after pû'ka *to roast*, the Shasti name is sók, the Pit River name ikhualé, while the name kamas, "sweet," is of Nutka origin. The botanists call the plant Scilla or Camassia esculenta. Cf. *Note* to 146, 1.

148, 14. ípakt, metathesis of ípkat, the conditional of ípka to lie there, to remain.

222 148, 16. púlχuantch. The gathering of this pupa or chrysalid and of its caterpillar,
462 the syeshí'sh, is chiefly done by the women of the tribes, who find them imbedded at
252 no great depth in the sandy ground around pine trees. Another chrysalid, the kûlî'gs,
is collected and roasted by them in the same way and tastes like eggs. kshû'n puetílank: putting grass under the chrysalids, not under the heated stones. The stones are replaced by other heated ones, as soon as they have cooled off; the larva assumes a black color after roasting and tastes like eggs. See púlχuantch in Dictionary.

221 148, 19. guiχakshä'migshta. The season of the year, when the exodus of the whole
222 tribe to Klamath Marsh takes place, where pond-lily seed is collected for the winter,
193 is about the middle of June. The ending -ta is an abbreviation of the case suffix -tat.
Three seasons are stated in the text, when the peeling of the inner or fibre bark of small pine trees is performed; of these the camass-season precedes the exodus to Klamath Marsh by a few weeks only, and the fishing season lasts from February to the end of the summer. Of course, the peeling of the kápka-pine coincides with the season when the sap ascends through the young tree. The bark is removed from about five feet to fifteen or twenty feet above the ground, and most of the beautiful pines treated in this manner are doomed to premature decay, though many survive the operation. The aspect of a forest with some of the pine trees peeled is rather singular.

148, 21. shánks hak, contraction of shánkish hak or ak.

149, 1. ka tánian for ka taniáni "so much in width or extent." The bud of the tákśish has a width of about half an inch. Cf. *Note* to 146, 1.

149, 3. 4. tók. This aquatic grass grows about two feet high; by é-ushtat is meant, here and in tsi'kal: Upper Klamath Lake.

194 149, 3. pä'lpali, vocalic dissimilation of pálpali or pä'lpäli; cf. taktä'kli 149, 14.

149, 5. Tchí'psam is a prairie grass on which the brown tchípash-seed grows.
This seed is extremely small, and it takes a long time before a sufficient quantity of it is
178 gathered to afford a meal for a family. Still smaller is the nútak-seed, and both are
striking instances of the persistence of the Indians in keeping up their old mode of living, when by agriculture and stock-raising they could procure provisions with infinitely less trouble and in much shorter time.

*539 **149, 6.** tü'ksh is probably the adessive case of tóke (ō) fire-place, hearth: tók-kshi.

262 **149, 12.** Tchuá is the long, cylindric root of the Sagittaria sagittifolia, an aquatic 824 plant common in the West and East of the United States. In Oregon the term *potato* 192 or wápatu (Chinook jargon) is most commonly heard for it. The name of Chewaukan [193] Marsh, a sink and low ground situated east of Upper Klamath Lake, is a corruption of Tchuaχō'ni: "where the arrow-leaf is found." The flower of the wápatu varies between red, reddish and whitish.

149, 17. Tsuni'ka. The flower has a diameter from two to three inches.

149, 21. Kû'lχamsh is put on strings by the women and thus serves to attract the fish.

149, 21. ptchi'nk: after this word ought to be seen the picture of a tiny vegetal cylinder, about one inch long and slightly curved.

[386] **150, 1.** Skáwanks or wild parsnip, a poisonous plant growing in wet places to the height of three feet.

150, 8. p'nü'sh, contracted from p'nálash, is the direct object (reflective) of shkukluápkasht: to guard themselves against becoming chapped by sun-burns. The wákinsh seems to be a kind of resin and furnishes a red paint, as does also the k'lépki.

E-UKSHIKÍSHAM KÍUKSHAM SHUÍ'SH SHUINŌ'TKISH TCHÍSH.

INCANTATION SONGS OF THE KLAMATH LAKE PEOPLE.

1. *Introductory song:*

Yä'ka ní, yä'ka ní, yä'ka ní *etc.* ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́

I sing, I sing, I sing (in chorus).

2. *Song, reference unknown:*

Wiwiwá! ní sháwalsh wítnank! ⏑ –́ | ⏑ ⏑ ⏑ –́ | –́ ⏑

Blown off! the plume-crest has disappeared from me!

3. *Song of the wind:*

Kanítala m'sh û shlewitaknû'la? ⏑ –́ | ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́ ⏑
népaksh a-i ní'sh shlewitaknû'la. ⏑ –́ | ⏑ – | ⏑ –́ | ⏑ –́ ⏑

Who, I wonder, is blowing out of my mouth?
The disease is emanating from my mouth.

4. *The conjurer's song:*

Tuá ki nû shatashtaknû'la? ⏑ –́ | ⏑ – | ⏑ –́ | ⏑ –́ | ⏑
nä'paks nû shatashtaknû'la. –́ | ⏑ – | ⏑ –́ | ⏑ –́ | ⏑
tuá kí' nû shatashtatχí'sh? ⏑ –́ | ⏑ – | ⏑ –́ | ⏑ –́
nä'paks nû shatashtatχí'sh. –́ | ⏑ – | ⏑ –́ | ⏑ –́

What do I remove from my mouth?
The disease I extract from my mouth.
What is the thing I take out?
It is the disease I am taking out.

[302]
● [193]

158; 51. The paint was put on expressly for the dance and smeared across her breast or anywhere on body; gûn for kē nû, gē nû, vowel û inverted.

158; 54. These spoken words are also repeated by the choristers. The repetition is very long and noisy and winds up in a howling. tutiχólatko, after having ceased to dream. This would imply, that after dreams fasting must be observed as a religious custom. k̲'lékshashtala for the correct form k̲'lekápkashtala. This phrase occurs in 68, 8., and is explained in *Note*.

158; 55. The meaning is rather obscure, probably owing to omissions.

Kiúksham shui'sh.

CONJURER'S INCANTATIONS.

[115]

Obtained from Chief Johnson and Sub-chief Dave Hill.

1. *Song of the disease:*

Nä'pakshtka hínui nû; k̲aluáshtat nû
By sickness I am prostrate; I am (now) up in the clear sky.

2. *Song of the woodpecker:*

Kóshash ká-a nû piupiutánna –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑
I am picking hard at the bark of a pine tree.

3. *Song of the túktukuash-hawk:*

Kuáta nû tchiliká nû ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ | ⏑
I am pinching hard.

4. *Song of the white-headed eagle:*

K̲aluáshtat nû tchutchúa ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ ⏑
I am croaking high up in the skies.

5. *Song of the weasel:*

Käflash nû shuína a ni yána ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ | ⏑ –́
From under the ground I am singing.

6. *Song of the mink:*

Atín tchelä'wash géna ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́
Ripples in the water-sheet I am spreading far and wide.

7. *Song of the skunk:*

Té-i, té-i, ksiúlχa –́ ⏑ | –́ ⏑ | ⏑ –́ ⏑
With shortened steps I am dancing.

*539
533
755 70. *Song of the little wipēlī'wash forest-bird:*

Wipēli'wash nû shuí'sh gi,
wuipléwĕsh nû shuí'sh.

My own song I sing, I the wipēlíwash-bird.
I the wuipléwash am singing about myself.

71. *Song of the witkatkish-hawk:*

Gé-u aí hû tû' sáwals, –́ – | –́ – – | –́ –
witkatkísam gé-u sáwals. –́ – | –́ – | –́ – | –́ –

My head-crest this is, it is that of the witkatkish-hawk.

NOTES.

[825] The incantations obtained from Morgan are mostly of the kind called shuinō'tkish, and a large number of them are attributed to birds. Some of them probably exist in a more explicit form, which was not remembered, and the rhythmic or musical form was obtained of a part of them only. A literal translation of these song-lines is an impossibility in most instances, if their sense has to be rendered in full; I have therefore furnished only paraphrastic interpretations. The list is alphabetic, and was arranged after the names of the animals, or other personified objects, to which the incantations are attributed. Many of these songs are referred to in the "Subject List of Incantations" given by Morgan. *539 533 755 192

164; 1. Ktsálui, to be resplendent with colors, is mainly said of objects showing a blue or purple tinge: pû'ksam shláps ktsáluitko, the camass-plant has a bluish color. This verb is also used when speaking of the rainbow; of the lizard: 165; 14., also of the weasel's fur-skin: 169; 55.

[779] 164; 3. The use of these conjurer's arrows is mentioned 73, 5.
